Lieutenant-Colonel G. J. H. Bell has been appointed Inspector-General of Prisons in Burma. Lieutenant-Colonel E. H. Wright has joined at Tanjore. Lieutenant-Colonel G. G. Giffard has been appointed Superintendent of the Government Maternity Hospital, Madras. Lieutenant-Colonel C. E. Sunder has taken up duty at Patna as Civil Surgeon. Lieutenant-Colonel E. C. Hare has been appointed Sanitary Commissioner in Bihar. Lieutenant-Colonel A. J. MacNab has taken up duty in Kashmir.

Major R. Markham Carter has been appointed to hold temporary Medical Charge of the Prison and Byculla Schools at Bombay. Major A. B. Fry, Special Deputy Sanitary Commissioner for Malaria Research in the Presidency of Bengal, has been appointed to officiate as Sanitary Commissioner during the absence on two years' combined leave of Major W. W. Clemesha. The services of Major W. V. Coppinger, civil surgeon at Lakhimpur, have been placed at the disposal of the Government of Bengal. Major R. M. Corry has been appointed to officiate as Civil Surgeon at Delhi. The services of Major J. W. Greig have been permanently placed at the disposal of the Government of the Punjab. Major G. McPherson has been appointed to officiate as Professor of Ophthalmic Surgery at the Government Medical College, Bombay. Major R. F. Baird has been appointed Civil Surgeon and Superintendent of the Lunatic Asylum at Benares.

Captain F. Palmer has been appointed permanently to the Jail Department in the United Provinces of Agra and Oudh. Captain T. F. Owens has been appointed Chemical Examiner and Government Bacteriologist in Burma. Captain M. Baket has taken up duty in Mardan as officiating Civil Surgeon. Captain J. L. Lunham has been appointed to officiate as Civil Surgeon at Karwar. Captain D. Heron has been appointed Vice-Consul at Seistan and Kain. Captain J. McC. Anderson has taken over civil medical charge at Hoshangabad.

SPECIAL RESERVE OF OFFICERS.

Royal Army Medical Corps.

Cadet William McMeekin Chesney, from the Belfast University Contingent, Officers Training Corps, to be Lieutenant, (on probation) (dated April 30th, 1914).

TERRITORIAL FORCE.

Royal Army Medical Corps.

2nd East Anglia Field Ambulance, Royal Army Medical Corps: Lieutenant Benjamin Branford Morgan, from the 3rd West Riding Field Ambulance, Royal Army Medical Corps, to be Lieutenant (dated April 18th, 1914).

1st Home Counties Field Ambulance, Royal Army Medical Corps: Lieutenant Arthur P. Draper resigns his commission (dated May 23rd, 1914).

3rd Home Counties Field Ambulance, Royal Army Medical Corps: Lieutenant Edwin A. Houchin to be Captain (dated April 12th, 1914).

Sanitary Service.—Captain George A. Brown resigns his commission (dated May 23rd, 1914).

For Attachment to Units other than Medical Units.—To be Lieutenants: John Chancellor McKenzie (dated April 20th, 1914), and Stanley Southam (dated Jan 3rd, 1914).

Attached to Units other than Medical Units.—Captain Henry A. C. Harris resigns his commission (dated May 23rd, 1914), and Lieutenant John A. West resigns his commission (dated May 23rd, 1914). Major William F. O'Grady is retired under the provisions of Paragraph 116 of the Territorial Force Regulations, and is granted permission to retain his rank and to wear the prescribed uniform (dated May 27th, 1914).

TERRITORIAL DECORATION.

The King has conferred the Territorial Decoration upon the following officers:—

Royal Army Medical Corps.

1st London (City of London) Sanitary Company, Royal Army Medical Corps: Major Lewis Thomas Fraser Bryett.

1st London Clearing Hospital, Royal Army Medical Corps: Lieutenant-Colonel Alexander Barclay Lyon.

Attached to Units other than Medical Units.—Major Andrew Robertson Wilson, attached to the 4th Battalion, The Cheshire Regiment. Major William Doig, attached to the 4th (The Border) Battalion, The King's Own Scottish Borderers. Captain William Turnbull Barrie, attached to the 4th (The Border) Battalion, The King's Own Scottish Borderers.

FIELD SERVICE NOTES FOR R.A.M.C.

Messrs. John Bale, Sons, and Danielsson have issued a list of amendments to "Field Service Notes for R.A.M.C.," by Major T. H. Goodwin, R.A.M.C., in order to ensure that all details as to personnel and equipment and also the marginal references to official publications may be in accordance with the latest editions of "War Establishments" and the "Field Service Manual." The amendments are published separately, price 4*d*.

BRITISH HOSPITAL FOR MOTHERS AND BABIES.—The Charity Commissioners have issued the draft of their scheme for the consolidation and future regulation of the charities hitherto known respectively as the British Lying-in Hospital, Endell-street, W.C., and the Home for Mothers and Babies, Woolwich. The new title of the consolidated charities is to be "The British Hospital for Mothers and Babies," and the ultimate object is declared to be "the establishment and maintenance in the metropolitan borough of Woolwich of a maternity hospital and school for the higher training of midwives." The scheme gives authority for the sale or continued letting of the old premises of the Lying-in Hospital in Endell-street and Nurses' Home in Betterton-street, Long Acre, and empowers the trustees to acquire a site in the borough of Woolwich for the proposed hospital and school and to erect thereon suitable buildings, the cost to be provided, so far as may be, out of subscriptions or grants received by the trustees, and as to the balance out of the funds of the charity. Pending the establishment of the said hospital and school the trustees may carry on, at the cost of the charity, the Home for Mothers and Babies at the premises in Wood-street, Woolwich, where it has hitherto been conducted, or at other suitable buildings in the same borough.

FOURTEENTH FRENCH CONGRESS OF MEDICINE.—This Congress will take place at Brussels from Sept. 30th to Oct. 4th this year at the Palais des Académies under the patronage of the King and Queen of the Belgians. The committee of honour, of which Professor Stiénon, of Brussels, is president, consists of 22 eminent professors. The following subjects are down for discussion: Syphilis of the Cardio-vascular System; Lipoids in Pathology; the Therapeutic Value of Artificial Pneumothorax; and Vaccinotherapy, especially in relation to typhoid fever and cancer. Among the reporters who have promised to attend are Professor Vaquez, Professor Vincent, and Professor Chantemesse, of Paris; Professor Spielmann and Professor Haushalter, of Nancy; Professor Burnand, of Leysin, and many Brussels professors. Many non-French nationalities will also be represented. The detailed programme of work and entertainments will shortly be issued. Subscriptions (20 francs) can now be received, and should be addressed to Dr. Godart-Dantrieux, 9a, rue Montoyer, Brussels. Ladies accompanying members and also students of medicine will be admitted as associate members for 10 francs. Members desiring to contribute papers must communicate before Sept. 1st with Professor René Verhoogen, general secretary of the organising committee, 22, rue Joseph II., Brussels.

Home and Foreign Notes.

(FROM OUR OWN CORRESPONDENTS.)

MANCHESTER.

Furnished Houses for the Very Poor.

THE corporation has approved of a scheme by its sanitary committee to provide as an experiment, subject to the permission of the Local Government Board, a three-storey block of furnished rooms in Rochdale-road for the use of the very poor. The cost will be £8973, and the annual sum for interest and sinking fund is £366. There will be 12 two-room "houses" at 6*s.* 6*d.* per week, and 30 one-room at 5*s.* 3*d.* per week. The estimated net income is £310, leaving £56 to be provided by the rates. Each house will have a living room 15 ft. by 13 ft., with a bed recess 6 ft. 6 in. by 4 ft. 6 in., having a window in an outside wall, a ventilated food cupboard, a ventilated wardrobe, and a projecting window with a permanent seat. There will be an adjacent small scullery with a sink, and a water-closet entered from the outside. The two-roomed houses have in addition a bedroom 14 ft. 9 in. by 9 ft. 9 in. The furniture for each double room is estimated to cost £7, and £5 for each single-roomed house. The articles provided will be a bedstead, mattress, pillows, blankets, chairs, crockery, and a table. The floors will be of concrete, the interior walls will have a good hard plaster finish, and all crevices will be filled up to make the building vermin-proof.

A Conference on Town Planning: Back-to-back Houses.

At a two days' conference held in Manchester on May 14th and 15th about 200 representatives of local authorities of Lancashire and adjacent counties met to discuss the practical administration of the Town Planning Act of 1909. In Manchester much had been done in improving housing conditions without waiting for the Town Planning Act. In fact, the housing conditions have been entirely changed during the last decade. The city council has already provided homes for over 4000 families and lodgings for over 700 people. Over 10,000 back-to-back houses have been demolished or converted to a more sanitary type of dwelling. There are now only 100 back-to-back houses in the city, and these will shortly be abolished or changed.

One Poor-law Union for Manchester.

At present there are three Poor-law unions in Manchester and each has a different rate, and the rate is heaviest in the poorest union and lightest in the richest. As a result of a recent Local Government Board inquiry, from the end of March next year there will be only one Poor-law authority for the whole of Manchester, and the new Poor-law union will be one of the largest in the country.

Flannelette and Inflammable Clothing.

The number of deaths amongst children in Manchester from burns average two per week, and these are due, in Dr. James Niven's opinion, largely to the use of flannelette. The sanitary authorities have decided, under the Fabrics Misdescription Act, to institute legal proceedings against any retailer selling inflammable flannelette as non-inflammable. Retailers, therefore, should obtain a warranty of non-inflammability from the maker or vendor. The purchaser is entitled to demand that the article be tested.

The Radium Fund for Manchester.

I referred in previous letters[1] to the scheme for providing radium for use in Manchester. In addition to the £4584 already promised, the Right Hon. Sir William Mather has promised £1000, Mr. Edward Hopkinson £100, and Mr. Laurence Pilkington £100. Also Bury is seeking to raise £2000, of which over £600 have been promised. A scale of charges for use of the radium will be so adjusted as to secure that the scheme when at work shall be self-supporting. As far as accommodation at the Royal Infirmary will allow, not only will patients sent from the other hospitals be treated, but also private patients sent by medical men. The radium committee will have power to admit to participation in the benefits of the scheme other hospitals, bodies, and persons, in addition to the hospitals named in the scheme.

Probable Settlement of the Doctors' "Strike" in Burnley Union.

Over 16 months ago the nine Poor-law medical officers of the Burnley union resigned on account of inadequate salary. Since then the board of guardians has been able to secure the services of only three medical officers to do the entire work of the union. It has now been decided to divide the union into 12 medical relief districts at a total remuneration of £505 a year, with extras, as compared with £365 two years ago. The nine resigned medical officers will be offered districts.

May 26th.

SCOTLAND.

Medical Inspection and Treatment of School Children in Scotland.

THE recently issued report of the Committee of the Privy Council on Education in Scotland deals to a certain extent with the question of medical inspection, and gives evidence of the progress which has been made during the last few years. Of the immediate perceptible results of the school medical officers' first visits, perhaps the most obvious consists in the more ready appreciation by school authorities of shortcomings in the premises under their charge in regard to such ordinary matters as the ventilation, lighting, heating, and cleaning of classrooms, the pattern of the desks, and, especially in rural schools, the condition of the school offices and the supply of drinking water. A large number of managers in country districts realise the culpable folly of neglecting to make any arrangement whatever for the midday meal of those children who live too far from school to go home for dinner, for which purpose school boards now have ample powers. The committee believe that personal cleanliness is on the increase, and greater attention is given to such plain matters of hygiene as the proper cleaning of the teeth. Regarding medical treatment the committee state that the returns showed a considerable variety in the methods of administration. The majority of school boards realising that to deal systematically with the entire range of ailments would have exceeded their resources, after surveying the whole needs of their district in the light of the school medical officer's report, and taking stock of the existing facilities for meeting those needs, concentrated their attention on some special class or classes of defects—for example, of the eyes or the teeth—in the thorough treatment of which it seemed that the money could be most effectively applied. In the larger towns and cities, where the number of cases involved action on a large scale, clinics were established and supplied with the staff and apparatus required for the particular forms of treatment to be undertaken. Many of the lesser school boards have found their best course to lie in an arrangement with the authorities of the local hospital or dispensary, who undertake all or part of the treatment, and are usually paid by the school board according to the number of cases sent to them.

Summer Post-graduate Courses in Edinburgh.

As I announced some months ago post-graduate courses will be held in Edinburgh during the months of July, August, and September, and particulars may be had from the secretary, the Faculty Office, University New Buildings. The University Union will be open during the months of August and September, and gentlemen attending the courses will be eligible for temporary membership. During the September courses accommodation and board may be had in one of the residences of the University Hall. During the last fortnight of July courses will be given on diseases and defects of children and on obstetrics and gynæcology. The course on internal medicine will extend from Monday, August 3rd, to Friday, August 28th, inclusive. The last courses will extend from Monday, August 31st, to Friday, Sept. 25th inclusive.

Dundee Hospital Burned Down.

A new hospital for women in Dundee, which was on the point of completion, was partially destroyed by fire in the early morning of May 22nd. The hospital was to have been opened next week. The damage is estimated at some £2000 or possibly more. The hospital, a two-storeyed building, was erected through the liberality of a number of leading citizens, and was designed to take the place of the present hospital for women in Seafield-road, which falls to be vacated next week. The new hospital was begun nearly two years ago, and every effort was being made to get it ready for occupation. It is generally assumed that the fire was the work of suffragists. Messages such as are common in other incidents of the kind were found. It is believed that six months will be required to get the damage repaired, and although the numbers at the old hospital were being kept down with a view to the removing from one premises to the other, it is probable that temporary accommodation will have to be provided. Fortunately the loss is covered by insurance.

Accommodation for Sick Children in Dundee.

The directors of the Royal Infirmary, Dundee, have intimated that they have decided to set aside a second ward of 30 beds for sick children, thus doubling the present accommodation. This will not in any way interfere with the accommodation for adults. It is hoped that the new ward will be ready in early autumn, when the new nurses' home, which is being erected, will be completed. The arrangement is by no means regarded as final or adequate, but until the movement for a children's hospital in Dundee takes definite shape it seems the best that can be made.

The late Dr. Alexander S. Jameson.

The death occurred at Batavia, Java, on May 17th, of Dr. Alexander Seymour Jameson, son of the late Mr. John Jameson, Powis Lodge, Old Aberdeen. Dr. Jameson was educated at Aberdeen Grammar School, King's College and Marischal College, Aberdeen, graduating M.A. in 1882 and M.B., C.M. in 1886. For eight years he practised in Ellon, and afterwards was for 13 years in practice in Stockton-on-Tees. Some time ago he fell into bad health, and died during a sea voyage to the Far East. Dr. Jameson is survived by his widow and by a family of one son and two daughters.

May 28th.

IRELAND.

The Insurance Act Certification Question.

AN important correspondence between Mr. M. R. J. Hayes, medical secretary of the Irish Medical Committee, and the Irish Insurance Commission has been published. It begins in March, at a time when the conversations which are said to have taken place between the Committee and the Commission came to a stop, owing, it is supposed, to the pressure exerted by the society officials on the Commission in favour of the appointment of medical men as whole-time certifiers. In a letter dated March 25th Mr. Hayes, on behalf of the Irish Medical Committee, informed the Commission that the profession would be willing to carry out certification gratuitously, say, up to June 30th, conditionally on the system of certification by medical advisers being abolished. Mr. Hayes also stated that the Irish Medical Committee had consented to medical men remaining on the panel up to June 30th. This letter received a bare acknowledgment. On May 18th Mr. Hayes asked whether the Commission had yet completed any scheme for dealing with the question, and expressed disappointment that no notice had been taken of the offer of the profession. The secretary of the Commission replied that "proposals for placing certification arrangements in Ireland on a permanent basis are still engaging the attention of the Commission." The Irish Medical Committee has summoned a meeting of delegates from all the county areas to meet in Dublin next Tuesday, June 2nd, to decide on the future policy of the profession. It is believed that the society officials have demanded that certification should be carried out by paid officers of the Insurance Commission, to the exclusion of the medical attendants of the members. Such a policy would rouse the bitter hostility of the profession, and if carried into effect would, like the present system of certification by medical advisers, lead to gross injustice to the insured. Following the meeting of delegates next Tuesday will be a mass meeting of the profession to protest against any system of certification other than by the medical attendant. I am requested to add that at its last meeting the Irish Medical Committee unanimously passed a resolution thanking Dr. C. Addison, M.P., on behalf of the medical profession of Ireland, for his exertions in trying to bring about a settlement of the certification question.

The Irish Medical Association.

The annual meeting of the Irish Medical Association will be held in Dublin on Wednesday, June 3rd, under the presidency of Dr. F. W. Kidd. The annual report shows that the affairs of the association are in a fairly satisfactory state. The membership on Dec. 31st, 1913, was 654. This number has since largely increased owing to the new journal arrangements made by the council. The accounts showed on Dec. 31st a credit balance of £461 16s. 5*d*., and a surplus on the balance-sheet of £819 19s. 5*d*.

Vaccination in Belfast.

A convincing statement has been sent to the Belfast board of guardians from the council of the Ulster Medical Society and from the executive committee of the British Medical Association (Belfast division) in reference to the campaign now being conducted in Belfast against vaccination. Details of local experience and of great importance are given. In the last outbreak of small-pox in Belfast (1904–05) out of 178 cases there were 9 deaths. Of those attacked, 146 had been vaccinated and 2 of them died, while of 32 who had never been vaccinated 7 died. Thus, 1 out of every 5 unvaccinated people who contracted small-pox died, while of every 73 vaccinated only one succumbed. There was not a single case of small-pox in a revaccinated person. Moreover, the medical superintendent of the Belfast Fever Hospital, whose experience extends over 20 years and covers six outbreaks, has never had a case of small-pox in a revaccinated person.

The late Mr. Harry Chestnut.

The tragic death of Mr. Harry Chestnut, of Tralee, has aroused sympathy not only in Kerry but throughout Munster, and wherever he or his family is known. He had been attending several members of a family suffering from septic sore-throats. The mother of the family was affected and had a high temperature. On visiting her in response to an urgent summons he found her bleeding profusely from an incomplete abortion. Having received no intimation of the abortion he was unprepared with gloves, but at once evacuated the uterus with his bare hand, and thus himself got a septic infection of his left forefinger. Realising the serious nature of his condition he consulted one of his colleagues in Tralee and soon after went to the South Infirmary, Cork. In spite of the unremitting care and skill of the staff the infection became general. For three weeks he made a gallant but fruitless fight, for he died on May 21st in the forty-fifth year of his age. Mr. Chestnut was a native of Tralee, the fourth son of the Rev. William Chestnut, minister of the Tralee Presbyterian Congregation. He studied in Cork, Galway, and Edinburgh, and qualified in 1891. Settling down to practise in his native town he soon earned the confidence and esteem of the entire community. He was most conscientious in the discharge of his duties, and spared no pains to keep himself abreast of the times in his work. His professional aid was sought far and wide over Kerry and the adjacent counties. The funeral took place on May 23rd, at which thousands of all creeds and classes attended.

May 26th.

PARIS.

Sentence on "Dr." Macaura.

I HAVE referred previously to the action against "Dr." Macaura, who for two years, by means of extensive advertising and public meetings, exploited an apparatus of his own invention, manufactured in Germany and sold for ten times its intrinsic value, which was to cure all diseases without exception. Judgment in the case has now been given by the Ninth Chamber of Correction, after 27 sittings, condemning him to three years' imprisonment and a fine of 3000 francs.[1] It is true that he left France a long time ago, but 11 persons were included in the action for complicity, among whom are a few medical men who lent themselves to the sale of the apparatus in the Macaura establishments of Paris and the provinces. There was even one who, from an assiduously cultivated personal resemblance, personated Macaura himself and procured for that person a reputation for ubiquity. There was also a Dr. Hacks, whose career was a remarkably mobile one, for he appears to have been successively a pantomime dancer, a ship's surgeon, a publisher of scandalous books, manager of a restaurant, and finally Macaura's secretary. He was condemned to six months' imprisonment and a fine of 500 francs. Another, one Rollinson, was condemned by default to one year in prison and a fine of 500 francs. The others received sentences varying from three to two months' imprisonment and fines of from 500 to 100 francs. Only one, Dr. Prébaut, was acquitted.

Indemnity for Damages due to X Ray Treatment.

Radiologists particularly have been the victims of actions by patients for accidents arising out of treatment, or for failure to cure. Recently a medical man was condemned to pay 18,000 francs damages to a woman who claimed 100,000 francs for a radiodermatitis which caused indelible cicatrices, due to the use of the X rays for removing superfluous hair from the upper lip. The considerations underlying the judgment are of interest, in that they admit the responsibility of the medical man only because the condition calling for treatment was trivial, and the risk far exceeded the possible benefit.

The Congress of Practitioners.

The biennial Congress of Practitioners is being held in Paris this week. It is more numerously attended than ever before, over 800 members being present. The reason for this large gathering is to be found in a certain disquietude among the medical profession at the pretensions of the national and municipal administrations which aim more and more to bring about important reforms, most often from political motives, and to impress the aid of the medical practitioner as a compulsory and unremunerated assistant in the exercise of these undertakings. The situation for many practitioners, especially those in the country, tends to become an intolerable servitude. The medical man certainly would never refuse his coöperation in the application of measures of public health and assistance in which he knows that his services are indispensable. He demands merely to have the effective direction of those services which are placed under his responsibility, or if such control must be kept in the hands of the lay administration and he must consequently play the part of an employee, then he demands to be treated as an employee—that is to say, to receive remuneration and to be the object of certain consideration. Such is the general attitude of the Congress, of which the resolutions—which cannot yet be sent for publication—have a certain importance, for there exists in Parliament a sufficiently large number of medical men, both Deputies and Senators, who rely upon the votes of the medical profession to bring pressure on the Government.

Portable Laboratories for the Army.

The Minister of War has determined on the creation of a special type of laboratory apparatus, enclosed in chests and intended for transportation in case of epidemics in small garrisons remote from an important hospital furnished with the necessary means, to be put at the disposal of specialists.

---

[1] THE LANCET, May 23rd, p. 1511.

particularly bacteriologists, when these are sent on a mission by the Ministry to study on the spot the causes of an epidemic and the proper methods for its prevention.

May 25th.

BERLIN.

Congress of the German Roentgen Society.

AT the Congress of the German Roentgen Society, held recently in Berlin under the presidency of Professor Levy Dorn, Professor Krause, of Bonn, read a paper on the biological action of the rays on normal animal tissue. He said that short exposures had an irritating influence on the cells, moderate exposures an inhibiting, and prolonged exposures a destructive influence, the young proliferous cells being especially liable to injury. The hypothesis that the rays produced a decomposition of lecithin into cholin was not yet substantiated. Dr. Reifferscheid, of Bonn, speaking on the influence of the rays on the ovaries, said that experiments which he had made showed that prolonged exposures produced a degeneration of the follicles and hæmorrhage in the ovaries, and that regeneration did not occur. Professor Wichmann, of Hamburg, discussed the Roentgen ray treatment of cancer, saying that in the case of growths in which the Roentgen rays had proved unsuccessful, treatment by means of other rays had sometimes resulted in recovery; the rays did not act at a depth of over 2 centimetres. In the discussion the views expressed by the speakers were far from being unanimous, as some were of opinion that operable cases ought first to be operated on and the Roentgen rays employed only at a later stage as a prophylactic against relapse, whilst others advocated a combined treatment, and others an exclusive treatment by Roentgen or radium rays. Dr. Schmidt, of Berlin, reported that he had treated 100 cases of furunculosis by the Roentgen rays without one unsuccessful case. A relapse had never been observed at the place where the rays had been applied. Dr. Eckstein, of Berlin, drew attention to the analgesic action of the rays which was still very little known. He said that analgesia was produced at once and lasted for a long time; this was especially obvious in cases of pain after operations and spastic conditions. Dr. Fritz Meyer reported good results in cases of chronic eczema and psoriasis. Dr. Hessel, of Kreuznach, described a method of obtaining a radiogram of the œsophagus; a piece of pig's intestine, the lower end of which was closed, was introduced into the patient's œsophagus and filled with bario-radiol by the open upper end. The piece of intestine could be drawn up when required by means of a thread attached to it. Dr. Schwarz, of Vienna, read a paper on the radiodiagnosis of pathological conditions of the colon. He said that chronic colitis was indicated by an increase of peristaltic contraction; in cancer an enema administered during radiographic examination was sometimes valuable for the diagnosis, as a growth either hindered the filling of the intestine or produced an interruption of the continuity of the filling substance. Dr. Graesner spoke on the subject of radiography of spina bifida occulta. He said that he had found this condition in about 70 per cent. of cases of nocturnal enuresis, and also in women suffering from prolapse of the vagina or uterus. Dr. Max Cohn read a paper on the radiographical examination of the appendix. He drew attention especially to the time of filling of the appendix and the time of evacuation of the bismuth emulsion. When after the evacuation residual bismuth was observed some pathological condition was present. Other papers were read before the congress on various physical and technological questions.

Antivaccinationists and the Legislature.

The antivaccination association has petitioned the Imperial Parliament to amend the existing laws concerning compulsory vaccination. It is especially desirous that a clause giving legal recognition to the "conscientious objector" after the British pattern should be enacted in this country, and that a mixed Commission consisting of supporters and of opponents of vaccination should be appointed to consider the whole subject. In the discussion a Socialist member alleged that since the recognition of "conscientious objection" London had remained free from an epidemic of small-pox and that it was more healthy than other cities in which vaccination was compulsory. Dr. Kirchner, the chief of the Government Medical Department, replied that as far back as 1911 the Imperial Parliament had declined to submit a similar petition to the Government for consideration; he asked whether thousands of children had perished since from vaccination or whether an epidemic had broken out. In the year 1913 only 19 cases of small-pox, with 12 deaths, had been notified. During the last 20 years no case of death from this cause had happened in the army. He then described the agitation worked up by the antivaccinationists, who distributed pamphlets in front of the premises where vaccination was performed, and who even induced parents to conceal their children from the vaccination authorities. Dr. Bumm, the President of the Imperial Health Office, said that the English clause concerning "conscientious objection" was a most unwise proceeding. In England in the first year after the introduction of that clause the proportion of unvaccinated children was only 5·8 per cent., but in 1908 the proportion rose to 18 per cent., and at the present time was about 40 per cent. He stated that when small-pox became prevalent in a town or district the objection at once disappeared and everybody wished to be vaccinated. This was observed in Metz at a time when some cases of small-pox had been observed, and many elderly people who had never before been vaccinated, asked quite of their own accord that they might be vaccinated now. The petition that an Imperial Commission consisting of supporters and of opponents of vaccination should be appointed was not agreed to, but a petition that the Government would consider the legal and scientific aspects of the vaccination laws was agreed to. It is noticeable that on this occasion the petitions were not summarily rejected by passing on to the order of the day as in previous years, but that the above decision was agreed to, a course which may be regarded as a kind of concession to the antivaccinationists.

May 25th.

MEETINGS OF CANADIAN MEDICAL SOCIETIES.—The Ontario Medical Association met in Toronto on May 26th, 27th, and 28th. The Ontario health officers met in annual convention in Toronto, May 7th and 8th. The Canadian Medical Association meets in St. John, N.B., on July 7th, 8th, 9th, and 10th. The Canadian Association for the Prevention of Tuberculosis will meet in Halifax, N.S., July 13th and 14th. The Fourth Annual Congress of the Canadian Public Health Association will be held in Fort William and Port Arthur, Ontario, Sept. 10th, 11th, and 12th.

Correspondence.

"Audi alteram partem."

THE PLEA FOR IMMEDIATE OPERATION IN APPENDICITIS.

To the Editor of The Lancet.

Sir,—The point in connexion with the question of immediate operation in acute *appendicitis* that neither Mr. Edmund Owen nor his followers will see is that it is the application of their principle to all cases, no matter what the stage of the disease, that is responsible for the unsatisfactory results that still exist in connexion with surgical interference in the acute phase of this affection. What the profession has to grasp and surgeons have to recognise, is that when acute appendicitis has existed for three or four days, and the possibly perforated and even gangrenous appendix is surrounded by inflammatory adhesions or even pus, but is shut off from the general peritoneal cavity, then the patient has a better chance of recovery under local and palliative measures than by immediate operation. These are the cases which when operated on give the fatal results, and are the cause of that heavy mortality in acute appendicitis which we all deplore. No fault can be found, as regards the results, with the doctrine that immediate operation should be practised within the first few hours of an acute attack of appendicitis instead of using medicinal and other measures; but it is the teaching that the principle holds equally good in all cases, no matter what the stage of the disease, that I take exception to, because I feel it is fraught with great dangers.

I am, Sir yours faithfully,

Glasgow, May 23rd, 1914. George Thos. Beatson.

MASSIVE COLLAPSE OF THE LUNGS.

To the Editor of The Lancet.

Sir,—Exclusive diaphragmatic breathing is the inevitable consequence of experimental, accidental, or pathological absolute disablement of the spinal cord at a high level. It is sometimes temporary and remediable, as in transverse compression, hæmorrhage, or curable disease. When, however, it results from permanently destructive causes it is practically incompatible with a prolongation of life. This is due to the fact that the diaphragm is purely inspiratory. That exclusive type cannot be imitated in health by our "voluntary diaphragmatic breathing"; because in this the expiratory abdominal muscles paired with the diaphragm preserve both their tone, which ensures a rhythmic "passive" expiration by their elastic recoil and that of the abdominal gases, and also their rhythmic "active" contraction, if this should be required. So long as that disablement remains absolute, we have to deal with an unexampled crippling of the respiratory mechanism—namely, an active rhythmic inspiratory force—without any rhythmic expiratory force. There is still a steady "tensive" intra-abdominal pressure; but this can only favour expiration at the cost of opposing the inspiratory efforts of the diaphragm and of gradually wearing them out. The added evil is that the effective work of the diaphragm lies at the back; and that, in the inevitably dorsal decubitus, the weight of the body steadily opposes the expansion of the bases, which are at the time absolutely the only respiratory reserve, and hastens their massive collapse. That trouble might conceivably admit of some alleviation, if we could engineer for those cases a "respiratory bed," to rest the body upon three suitable air cushions: one along the spine, another across the upper thorax, and a third across the lower part of the trunk, thus relieving the posterior and lateral bases from all pressure. At best this would only be an instalment; but, to be of any use, it would brook no delay in its application.

Whenever, in cases not absolutely hopeless, a determined attempt at any life-saving surgical or medical treatment is contemplated, the first essential for success is an immediate resort to respiratory treatment, to preserve as much of the advantage from a still normal basic condition as can possibly be saved. Any continuously acting substitute for the lost abdominal tone, such as the prone decubitus or a light elastic abdominal belt, being out of the question, the main rational indication is to supply the missing rhythmic expiratory force. This leads to a second even more vital consideration. There seems to be no escape from the conclusion that, for any truly thorough treatment of that exclusive diaphragmatic breathing so long as it lasts, there can be no adequate alternative to the application of a rhythmic manual "artificial expiration," to be judiciously kept up day and night by a relay of highly competent hands, in analogy with the digital compression of arteries for hæmorrhage or aneurysm.

These clinical remarks, limited to the extreme fringe of the wide subject now under discussion in the columns of The Lancet, are as much as I can dare ask space for; but they have some practical bearing upon the whole of it. The approved posture in the treatment of the local massive thoracic and pulmonary collapse and the abdominal atony of rickets, of the respiratory urgencies (due to scattered lobular collapse) of broncho-pneumonia and of whooping-cough, and of many analogous instances of disablement by collapse, including phthisis, is still exclusively dorsal. I need therefore only renew the old plea for some revision of the therapeutical question, and for some wider clinical recognition of the practical uses of the prone decubitus, and of its abdominal factors, in the light of the anatomy and physiology of the respiration and of the circulation.

I am, Sir, yours faithfully,

Upper Brook-street, W., May 25th, 1914. William Ewart.

RE-EDUCATION OF THE DEAF.

To the Editor of The Lancet.

Sir,—I have read with interest Mr. Richard Lake's paper in The Lancet of May 23rd, but my experience, so far as it goes, leads me to think that he has formed an unduly pessimistic view of the value of auditory re-education.

I have recently obtained one of the instruments designed by M. Zünd Burguet. I did so for two reasons: first, because I had read in French journals reports of cases which had been remarkably benefited by the treatment; and secondly, because I had myself spoken to one or two patients who had been treated by this method and who felt themselves greatly benefited.

I have, of course, hitherto carefully refrained from recommending or using the treatment in the case of any patient where the question of a fee entered until such time as I was convinced of its value, and so far I am using it only in the case of personal friends or in hospital patients, and I have obtained improvement in the majority of these cases. The improvement, I am convinced, is more than can be accounted for by suggestion or by the optimism engendered in the deaf by any new form of treatment. What proportion of cases will respond and how long the improvement will last remains to be seen. The disadvantages of the treatment, especially in the present state of our knowledge regarding it, are: (1) that a considerable number of séances must be given before we can judge whether it will be of service or not; and (2) that the resulting improvement is not claimed to be permanent. While recognising these points, however, it must be remembered that there is no other known method of treatment which is of the least value in the forms of deafness for which auditory re-education is employed. There is no *a priori* reason why the method should necessarily fail in such cases, and, as apparently good results have been obtained by its use, I submit we should not condemn it without careful trial.

I observe that Mr. Lake speaks of using an instrument different from that issued by Zünd Burguet. Whether Zünd Burguet's instrument differs materially from that used by Mr. Lake I cannot say, but if it does it seems hardly fair from a trial of one variety of instrument to condemn the whole principle as of no value. I understand that Zünd Burguet does not recommend his treatment in congenital deaf-mutes. It is interesting to note that this is the only class of case in which Mr. Lake has obtained any benefit.

I hope when sufficient time has elapsed to enable me to come to a conclusion with regard to this treatment to publish my results in full.

I am, Sir, yours faithfully,
Edinburgh, May 25th, 1914. W. G. PORTER.

THE ABDERHALDEN TEST FOR PREGNANCY AND THE COMMENCEMENT OF GESTATION.

To the Editor of THE LANCET.

SIR,—In the *Edinburgh Medical Journal* for January of this year I endeavoured to prove from clinical facts that in the human female fertilisation may take place at any time during an intermenstrual epoch except during the three days prior to menstruation, and that gestation invariably starts during the three days preceding the first suspended menstruation of pregnancy. Hitherto, as I have already on many occasions observed, no person, either medical or lay, has been justified in suspecting the occurrence of impregnation until and unless a menstrual period has been missed. Because of a lack of more precise data embryologists as a matter of course have been content to reckon the age of every human embryo from the date of the cessation of the last menstrual discharge, as though fertilisation and gestation were not only coequivalent embryological terms, but as though the ovum was invariably fertilised soon after a menstrual period, and was always the ovum belonging to a past menstruation. Embryologists refer to the state of development of the human ovum during the so-called different stages in terms like the following: "In the beginning of the third week a fifth stage is reached"[1]; "About the middle of the third week, that is to say, about 16 or 18 days after the fertilisation of the ovum, various parts of the embryo are becoming rapidly differentiated."[2] From statements of this character one would naturally infer that not only is the fertilisation time definitely settled, but that fertilisation and gestation are essentially coequal phenomena. This, in my opinion, is quite a fallacy. I maintain that gestation, like incubation, is synonymous with vitalisation. It is very evident that the fertilised seed, whether vegetal or animal, is merely endowed with the power of life and is of itself powerless to start its own life. The grain of wheat which has lain dormant in the Pharaohs' tombs for thousands of years possessed during all these years the power of life, but did not display life until activated by favourable external influences. Regarding even the time when the placenta begins to form and when it is fully developed—not, of course, fully grown—our knowledge is most unsatisfactory.

Now in dealing with the defensive ferments of our bodies Abderhalden refers in the following terms to a ferment of pregnancy: "Many of our researches," he says, "and those of various observers have shown that during the whole period of pregnancy defensive ferments circulate in the blood which are able to reduce placenta albumin. These defensive ferments may be demonstrated within about eight days after impregnation."[3] Biologists everywhere must hail with satisfaction this pronouncement of the existence of a ferment peculiar to pregnancy, and if this test for pregnancy is as reliable as Abderhalden and many other authorities allege, then assuredly little or no difficulty should be experienced in settling whether the ovum which is fertilised is that of a past or of an oncoming menstruation, and whether fertilisation and gestation are to be looked upon as synchronous phenomena. The new light thus thrown upon the development of the human embryo may call for radical alterations in our text-books on embryology, but it must never be forgotten that it is the duty of science to unearth the truth.

I am, Sir, yours faithfully,
JAMES OLIVER, M.D., F.R.S. Edin.
Harley-street, W., May 23rd, 1914.

PHAGOCYTIC TREATMENT OF DISEASES OF THE EYE AND EAR.

To the Editor of THE LANCET.

SIR,—May I draw the attention of your readers to the following case? It is one out of many striking cases in my experience in which I have found that the ordinary treatments of eye and ear inflammatory affections were strongly reinforced by the phagocytic action of nuclein, a remedy which does not seem to be known as well as it deserves.

Miss A. B., aged about 65 years, came to me with a large corneal ulcer which seemed upon the point of perforation. She had suffered from it without treatment for about a fortnight. There was severe keratitis over the whole cornea, and hypopyon, filling about one-third of the anterior chamber. The patient was of a highly nervous disposition, and refused to allow either paracentesis or application of the cautery. I had therefore to rely on medicinal treatment by means of a protective bandage, antiseptic lotions, and instillation of eserine drops, to lessen the danger of prolapse of the iris if the perforation, which seemed imminent, should occur. In addition I ordered the patient to take two capsules, each containing 2 grs. of nuclein (supplied by Parke, Davis, and Co.), three times a day. The result was surprising. Perforation did not occur. After a couple of days the ulcer began to clear and heal. The keratitis gradually cleared up, the hypopyon absorbed, and at the end of about a fortnight the ulcer had healed, leaving the cornea clear, with the exception of a dense leucoma on the site of the ulcer. From the bad condition of the eye when I first saw it I have no doubt that the ulcer would have progressed and perforated but for the action of the nuclein.

[2] Ibid., p. 18.

[3] Defensive Ferments of the Animal Organism, English translation, 1914, p. 95 et seq.

This is but one case of many in which I have found nuclein of decided benefit. If taken in time it aborts styes, boils, acne pustules, acute otitis, coryza, influenza, enlarged glands, gingivitis, incipient dental abscess, &c. Even when suppuration has occurred it frequently happens that, under the action of nuclein, the inflammation subsides and the pus absorbs. It has a beneficial action on keratitis, iritis, dacrocystitis, and, in a lesser degree, on conjunctivitis and chronic middle-ear disease.

Nuclein is said to be the chief constituent of the nuclei of cells. It is a complex proteid body containing a large amount of phosphorus in the form of nucleinic acid which is combined with a highly complex basic substance. For medicinal purposes it is prepared from yeast and acts by largely increasing the number of leucocytes in the blood and thus increasing the disease-resisting powers of the body. By the increased number and activity of the leucocytes certain pathogenic micro-organisms are more rapidly destroyed.

Hahn[1] of Munich has shown that nuclein can double the number of leucocytes in a short time, while von Mayer[2] has observed an increase of over 75 per cent. Hahn found also that defibrinated blood from an animal under the influence of nuclein had a greater bactericidal effect upon staphylococcus pyogenes aureus and upon bacillus coli than normal blood from the same animal. Vaughan[3] found that injections of nuclein protected animals against virulent cultures of the diplococcus of pneumonia and that, by the same means, he could render rabbits immune to the tubercle bacillus.

Other observers have recorded its effect in improving general nutrition and increasing resistance to pathogenic germs. Good results have been reported in pneumonia,[4] typhoid fever,[5] cholera,[6] septicæmia,[7] puerperal fever,[8] scrofula,[9] carbuncle,[10] tonsillitis, tuberculosis,[11] indolent ulcers, general debility, &c. Miculicz-Radecki,[12] Renner,[13] Hannes,[14] and Chantemesse[15] have recommended nuclein as a prophylactic against septicæmia after operations. Renner reported that in Miculicz's clinic the mortality in abdominal sections fell under nuclein prophylactic treatment from 31 to 11 per cent. Achard and Redfield[16] found it useful as a surgical dressing. I know myself that there is much more rapid healing of operation wounds and less danger of sepsis if nuclein be administered.

A more powerful preparation for phagogenic treatment is the mycolysin of Dr. Doyen, of Paris. This is stated by Doyen to be "a preparation of phagogenic colloids extracted from a certain number of natural ferments," and has an even more powerful effect than nuclein in producing increased phagocytosis. Its expensiveness, however, precludes it from use in many cases. It is sold in three forms—viz., liquid mycolysin, an agreeable but expensive preparation; extract of mycolysin, cheaper but less palatable; and mycolysin injection for hypodermic use in grave cases. These remedies, nuclein and mycolysin, deserve more extended use than they have hitherto enjoyed in these islands. Nuclein is largely used in America and mycolysin in France, but here both seem to be practically unknown to the profession.

I am, Sir, yours faithfully,
JOHN P. HENRY, M.D., B.Ch. Dub.
Galway, May 25th, 1914.

CONGENITAL DEFECT OF THE ULNA.

To the Editor of THE LANCET.

SIR,—In THE LANCET of May 23rd I see my friend Mr. Paul Roth describes a case of congenital defect of the ulna, and suggests passive movement, a splint at nights, and possibly an operation. I, too, have been troubled with this rare complaint, but owing to my determination to persist with outdoor games, such as tennis, great hypertrophy of the wrist tendons and carpal bones has ensued and greatly relieved the condition—in fact, cured it for all practical purposes. Active movements, therefore, seem the most promising line of treatment. I should be glad to hear from any of your readers who have had practical experience of this complaint.

I am, Sir, yours faithfully,
ARTHUR G. WILKINS, M.B. Vict.
Glenridding-on-Ullswater, Penrith, May 23rd, 1914.

THYROID EXTRACT IN NERVOUS DISORDERS.

To the Editor of THE LANCET.

SIR,—The subject of thyroid therapy is one that has interested me deeply for some time past, and I should be glad to have the opinion of other readers of THE LANCET upon certain cases in which I have prescribed thyroid extract with favourable results.

Recently I was called in to attend a girl of about 7 years of age. She was quite unable to stand, and had extensive paresis of the muscles of the left arm, whilst the muscles of the back appeared to be very weak. I elicited the information from her mother that a few weeks previously the child and her sister had sore-throats, which the doctor in attendance regarded for a time as diphtheritic. There was complete absence of patellar, wrist, and elbow reflexes, and the legs and left arm appeared to be flaccid and useless. The child when placed on her feet simply collapsed on the floor. The weakness had been noticeable for about 14 days, and had come on gradually. Induced by the powerful effect of thyroid extract in clearing up certain sequelæ of diseases of toxic origin I determined to try it in this case. The result is that the child is now, after a period of five weeks, able to walk without assistance and has improved physically in a remarkable degree. I prescribed 1 grain daily of thyroid extract, with 45 minims of syrupus calcii lactophosphatis, three times daily. I have never known a case of diphtheritic paralysis so advanced to clear up in so short a time, and have not seen any records of the use of thyroid extract in this condition.

Another condition in which this remedy has arked beneficial effects, and which has been eferred to by several writers, particularly Dr. eonard Williams, is noctural enuresis in children. n many such cases, notably those showing rickety haracteristics, a very disagreeable concomitant is xcessive blinking of the eyelids. In two cases in hich I employed thyroid extract in conjunction ith syrupus calcii lactophosphatis this symptom isappeared in a few days, and in one of these, in hich the remedy was withheld for a few weeks, the blinking reappeared only to disappear once more under the renewed administration of the drug. Post-diphtheritic paralysis is held to be due to a peripheral neuritis of toxic origin. Probably the blinking is a reflex action set up by some irritation of the nerve-endings in the conjunctiva, and is, therefore, a parallel condition.

EPIDEMIC JAUNDICE AMONG SCHOOL CHILDREN.

To the Editor of THE LANCET.

SIR,—The annotation in THE LANCET of April 4th, under the above heading on the observations of Dr. Cameron R. Gibson in the March number of *Public Health*, has aroused my curiosity to a degree that I would fain ask the following questions: 1. At the time of the outbreak of epidemic jaundice was typhoid fever in endemic or epidemic form in the same district? 2. Were the stools of the cases examined or a blood-test made (Widal's reaction)? 3. Were there prevalent at the time any allied gastro-intestinal affections, such as paratyphoid, influenza with enteric symptoms, dysenteric diarrhœa, gastro-enteritis, and stubborn dyspepsias? 4. Have any of the jaundice cases been examined since their attack with a view to know if they are carriers or not?

My experience of epidemic jaundice is that one form at least is closely allied to typhoid fever, due probably to a direct invasion of bile-ducts and gall-bladder from the intestinal tract. If we keep in mind the direct continuity of the mucous lining of the one with the other, the inference of direct invasion is reasonable and natural. If in a house there appears an outbreak of typhoid fever, there also I expect one or more cases of jaundice; moreover, the appearance of jaundice causes an abortion of the typhoid syndrome. There is a direct statistical relation between epidemic jaundice and typhoid outbreaks; they increase and wane together, the tide is at its height in autumn and commencing winter, depending chiefly on the pollution of surface water. I consider many cases of gallstone and cholecystitis can date their commencement from an attack of catarrhal jaundice or a catarrhal state of biliary system hardly sufficient to cause jaundice, due, in my opinion, to direct invasion by Eberth's bacillus from the intestinal tract.

I am, Sir, yours faithfully,

Argentina, April 29th, 1914. M. A. I.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—There are five vacancies on the Council of the College, which will be filled at the annual meeting of the Fellows on Thursday, July 2nd. Nominations of candidates for these vacancies must be received by the Secretary of the College not later than Friday, June 5th next. A voting paper for the election will be sent to every Fellow whose address in the United Kingdom is registered at the College on June 16th.

THE GENERAL COUNCIL OF MEDICAL EDUCATION AND REGISTRATION.

TUESDAY, MAY 26TH.

THE General Council of Medical Education and Registration began its summer session to-day at its offices, 299, Oxford-street, W. Sir DONALD MACALISTER, the President, was in the chair.

New Member.

Sir Lambert Hepenstal Ormsby, F.R.C.S. Irel. (introduced by Sir Henry Morris), took his seat on the Council as representative of the Royal College of Surgeons in Ireland for one year from Feb. 5th, 1914.

President's Address.

The PRESIDENT then delivered his address. He said: The severe illness which prevented me from attending the Council and delivering my customary address last November has enabled me to apprehend more clearly than before two facts of importance. One is that in a time of weakness I may count securely on your active support and sympathy; for this gratifying experience I thank you all from my heart. The other is that when the President is away the Council carries on its work as efficiently as ever; this experience is also most salutary—for the President.

Let me express my deep personal gratitude to the senior treasurer, Mr. Tomes, for undertaking the responsibilities and performing with such acceptance the duties that are incident on the chair; to Dr. Norman Moore and the other chairmen of Standing Committees for their readiness to lighten the acting President's burdens, and so to lessen my own; to Dr. Norman Walker for keeping me informed of the progress of the sessional business from day to day and for acting in many other ways as my helper in matters concerning the Council's interests; to all my colleagues for their most friendly encouragement and coöperation; and to the Registrar and his staff, without whose capable assistance I could not during my convalescence have carried out the various instructions conveyed to me under the resolutions of the Council. In view of all the valuable help extended to me, I venture to hope that the work of the Council will be found to have suffered no detriment from my temporary failure of health.

It falls to me to record with regret the deaths of two old and esteemed friends—Sir John Batty Tuke, who in 1912 retired after 25 years of office as a member of the Council; and Dr. P. H. Pye-Smith, for over six years (1901–07) one of our treasurers. I have also to note the retirement, since I last addressed you, of Dr. Lorrain Smith, consequent on his translation to a distinguished position in the University of Edinburgh; and of Sir Arthur Chance, on the completion of his last term of able service as representative of the Royal College of Surgeons of Ireland. On the other hand, I desire to offer a welcome to the new members—Dr. Elliot Smith from the University of Manchester, a former pupil of mine at Cambridge, of whose scientific eminence I am naturally proud; and Sir Lambert Ormsby, past President of the Irish College, who has already rendered assistance to the Council as one of its examiners in surgery. I would further take the opportunity of congratulating Sir Christopher Nixon on his admission to the Privy Council of Ireland, and of wishing him renewed health to enjoy that right honourable distinction.

Reciprocity under the Medical Act.

His Majesty in Council has issued Orders applying Part II. of the Medical Act (1886) to the Province of New Brunswick in the Dominion of Canada, and to the ancient colony of Newfoundland. In each case the Executive Committee has been satisfied that the educational and other requirements prescribed by law for the local qualification of practitioners are in accordance with the conditions desired by the Council. Under the powers given by your Standing Orders the committee has therefore intimated that practitioners possessing recognised qualifications granted in New Brunswick or Newfoundland, who produce the statutory evidence required under the Act, may be registered in the Colonial List of our Medical Register. Although Part II. of the Medical

Act (1886) has for many years been applied to India, no general law has yet been passed for the regulation of medical practice throughout the Indian Empire. The Council has, therefore, for purposes of recognition and registration, had to deal only with the curricula and degrees of the Indian universities severally. Graduates of these universities applying for registration here have not hitherto had to show, in the terms of the Act, that they were "by law entitled to practise" in any Indian presidency or province, for it appeared that the law imposed no restriction on the practice of anyone, qualified or unqualified. The Secretary of State for India has now informed the Council that legislation for the registration of medical practitioners, in terms similar to those of the Medical Acts, is now operative in the Bombay Presidency, and is contemplated in Madras and Bengal. Such legislation will doubtless be welcomed by the Council in the interest of the people of India, for it should tend to promote medical education in that country, and so to increase the efficiency of medical practice. The Council will be able to coöperate with the provincial governments, as the new legislation takes effect, by requiring Indian graduates applying for registration in the United Kingdom to show, as the Act directs, that they are "by law entitled to practise" in the "British possession" within which their qualifications have been granted.

The Council will remember that relations of reciprocity have also been established between this country and Japan. British qualifications are current in that Empire, and the Japanese degrees corresponding to Bachelor and Doctor of Medicine qualify for admission to the Foreign List of our Register. We have received an official intimation that the Japanese medical laws have now been extended to the Empire of Corea, and a further intimation that at present the only professional qualifications, other than Japanese, conferring a title to practise in Corea are those accepted for registration in the United Kingdom.

Election of Direct Representatives.—National Insurance Act.

The Bill, prepared in the Privy Council Office, for amending the existing provisions relating to the election of Direct Representatives, with a view to greater economy of labour and money, has again been presented to Parliament, this time in the House of Commons. Last year the Bill passed the House of Lords, but failed to reach the Statute Book. I am given to understand that, if conditions are favourable for its consideration this year, it will receive important support from both sides of the House.

Much attention was given by the Council at the end of last year to certain questions arising under the Regulations for National Health Insurance. The correspondence with the Insurance Commissioners on these questions, undertaken by the President at the instance of the Council's special Committee and of the Executive Committee, has been communicated to members of the Council and published in the current Minutes. From these it will appear that, in response to representations made on the Council's behalf, the Commissioners have issued new Regulations. These they believe will remove the misapprehensions entertained by certain local authorities as to the legal status and responsibilities of qualified medical practitioners, and the legal disabilities of unqualified practitioners, in regard to the medical treatment of insured persons. The Commissioners have further intimated to the President that, in framing their official forms and memoranda, every effort will be made to exclude phrases which might seem to afford occasion for any contravention of existing statutes bearing on the subject. There is good reason to believe that the efforts of the Commissioners have been effective in informing local authorities of their duty in relation to the "medical treatment" of insured persons desirous of making their "own arrangements." The recent conviction, for illegal practice, of a person with whom it is alleged that such "arrangements" had for a short time subsisted, will no doubt serve to impress on Insurance Committees the necessity of safeguarding the insured against "treatment" by persons who cannot administer it without breaking the law.

Penal Cases.—Death Certification.

From time to time communications reach the Registrar vaguely alleging that medical men, sometimes described as "panel," and sometimes as "non-panel" practitioners, are disregarding the warning notices of the Council in respect of canvassing or advertising with the intent to attract patients, or of issuing certificates of a misleading or inaccurate character. By direction of the Executive Committee the Registrar has made it widely known that the Council takes a grave view of such practices, and has intimated its purpose to inquire judicially into the conduct of any practitioner against whom a substantiated complaint of the kind may be brought. Certain complaints of this nature will, on the advice of the Penal Cases Committee, be submitted for your judgment during the present session. But it is proper to say that a few general allegations have been sent to the office, which were unsupported by tangible evidence, or were made by persons who declined to take the responsibility of formulating any specific complaint on which even a preliminary inquiry could be based.

The unsatisfactory state of the law in relation to the certification of deaths has frequently been commented on by the Council, and numerous representations have been made to successive Governments in favour of its amendment. The attention of the Executive Committee has again been directed to the subject, partly on account of communications I have had before me from coroners and others pointing out anomalies in the methods of local registration, partly also on account of the efforts of our own Registrar to ensure that local registration authorities shall be provided with proper means of ascertaining that persons signing what purport to be valid certificates are in fact legally registered practitioners. A memorandum setting forth the relevant extracts from the Council's minutes was prepared in the office and forwarded to the present Registrar-General for his information. In acknowledging its receipt the Registrar-General was good enough to inform me that fresh instructions were being issued which would effect certain improvements long desired by the Council. In particular, the local registrars were to be instructed that any death for which no certificate of cause of death is produced from a registered medical practitioner must be reported to the coroner; and further that the expression "medical certificate of the cause of death" means exclusively "the certificate of a registered medical practitioner who was in attendance during the last illness." But in addition to the improvement in registration practice thus contemplated, much remains to be done for the safeguarding both of the public and of the profession, and for the procuring of trustworthy statistics of disease and death. It will probably be found that fresh legislation is necessary. The subject is still under consideration by the Executive Committee with a view to suggesting what steps the Council may properly take in regard to it.

Evidence given at Royal Commissions, &c.

The Royal Commission on Venereal Diseases asked me, as President, to give evidence before it. I was questioned on such matters, within the Council's purview, as the training and testing of the medical student in respect of these diseases, the mischief of "unqualified" treatment of them and how the mischief may be checked, the sufficiency of the existing methods of certification, especially in their bearing on the vital statistics of syphilis, &c. I thought you would deem it my duty to place at the disposal of the Royal Commission the reports, yearly tables, and the like showing the results of qualifying examinations throughout the country, together with recent answers from officials of the examining bodies to particular questions which I sent them at the instance of the Commission. Information obtained by the efforts of the Unqualified Practice Committee was also furnished, and I understand that it has been found exceedingly useful and suggestive. On the question of death certification the memorandum, to which I have already alluded, was of value in showing the action of the Council in this matter before the new instructions were issued. My evidence will no doubt be published by the Commission, and you will be able to judge how far I have correctly represented the knowledge and the judgment of the Council concerning the questions that were raised.

Another Royal Commission—namely, that on the Indian Services—requested me to appear in person, or to name a representative, to testify on questions relating to the Medical Service of India. As such questions have recently been before the Examination Committee, I asked the chairman, Sir Charles Ball, to take my place as a witness, and he kindly consented to do so. It is probable that his committee will present a further report on certain points that have arisen out of communications from the Government of India and the India Office on the qualifications of members of the Subordinate Medical Service.

The Registrar, with my approval, has appeared before a committee appointed by the Board of Education. The committee had to consider a proposal, made by a body of unqualified persons practising dentistry, that their "certificates" of dental soundness should be recognised and accepted by the Board in the case of candidates for employment as teachers. The Registrar supplied the committee with official information relating to dental students, the dental curriculum and examinations, the provisions of the Dentists Act, the legal decisions bearing on dental practice, and the disabilities of unqualified practitioners. He was thanked by the committee for the assistance he had afforded them.

Midwives (Scotland) Bill.

The Midwives Act of 1902, under which certain duties are laid upon this Council, does not apply to Scotland. A Bill "to secure the better training of midwives in Scotland, and to regulate their practice," has on the initiative of Lord Balfour of Burleigh passed the House of Lords, and now awaits consideration in the other House. Having in mind certain improvements on the English Act that have from time to time been desired by this Council, I ventured on your behalf to suggest to Lord Balfour at an early stage that these might advantageously be introduced into the Scottish Bill, and I believe that nearly all of them have now been incorporated. The Lord President has sent us a copy of the Bill as thus adjusted, with a request for our observations. The Executive Committee will in due course be ready to propose a convenient method of dealing with the subject. His Majesty has been pleased to appoint Dr. McVail, Dr. Norman Walker, and myself to be members of a board for improving the medical and nursing services in the Highlands and Islands of Scotland. The board has only begun its work, but already it is impressed with the urgent importance of securing better training for midwives, and of legally regulating their practice in the districts with which it is concerned.

Financial Questions.—The Pharmacopœia.—Inspection of Examinations.

I have dwelt at some length on what I may call the external activities of the Council. Inasmuch as these are mainly exercised during the recess, it is proper that they should be reported to you in full session, that those who have acted on your behalf may be assured that they have rightly understood your directions. Let me now say something about more domestic matters. The finances of the Council are in a satisfactory condition. Although the income last year rose by only £72, the expenditure fell considerably, chiefly owing to our shorter sessions. There is, therefore, a surplus on the annual account of £1645. The net deficit accumulated during the five years 1908–1912 amounted to £1363. At the end of 1913 we were able to pay off this deficit entirely, and to start the present year with £282 to the good. This result is highly favourable to the branch councils; for while in 1908 we had to draw upon their incomes to the extent of nearly 90 per cent., in 1913 the "percentage rate" was under 60. The treasurers report that the current year also may be expected to produce a surplus, but for various reasons it is likely to be of less amount.

The Pharmacopœia Committee and the Editors have been busily occupied in forwarding the preparation of the text and appendices of the British Pharmacopœia. Before the end of the present session the committee will be able to lay on the table of the Council a copy of the revised proof. Subject to typographical and other editorial corrections to be made in the final proof, this will represent the completed work, and the committee hope to have it ready for issue during the summer. Following the procedure approved on the last occasion, you will probably desire to delegate to the Executive Committee, at its regular meeting in July, the duty of formally adopting the British Pharmacopœia, 1914, and of arranging with the Treasury as to cost and price, indicating the conditions under which copies may be made accessible to the public in advance of promulgation, and advertising the date of official publication in the gazettes. I may be allowed here, as chairman of the Pharmacopœia Committee, to express publicly our deep obligations to the editors, Professor Tirard and Professor Greenish, for their skilful and devoted labours, and to the several committees of reference who have aided us in manifold ways to attempt a work worthy to take its place as the official dispensatory of the British Empire.

Turning to other official publications, I would call your special attention to the new and much improved form in which the Medical Register, the Dentists Register, and the Students Register are now produced. Thanks to the ingenuity of the Registrar, and the skill of the Council's publishers and printers, all of these works are now handsomer in appearance, lighter to handle, and easier of reference than ever before; and yet I believe that in a year or so, when the cost of entire resetting is paid off, it will be found that the improvement is accompanied by a considerable economy in the cost of production and publication. The Registrar's constant endeavours to this end deserve to be warmly acknowledged by the Council.

I have suggested to the chairmen of the Education and Examination Committees that it may be well to consider the question of beginning, at an early date, another cycle of inspection of qualifying examinations. Since the reports on the last cycle were considered a number of new licensing bodies have been created by Parliament, and are now fully organised for the work of professional education and examination. It would appear desirable that the Council should possess detailed information, derived from actual inspection, concerning their methods and standards. Such information may at any time be required of us for the use of Government and other official authorities, and it behoves us to procure it in the ways that the law directs us to follow. My own opinion is that in view of recent changes affecting the profession of medicine, and of the prospective demands upon professional knowledge, skill, and practical efficiency, a general inquiry extending to all the bodies, and carried out by inspectors appointed under our Standing Orders, would be timely and useful. But on that head it rests with the two committees, acting jointly, to offer you considered advice.

My address is already unduly prolonged, and I refrain from referring to other matters appearing in the programme. For the most part they speak for themselves; the rest will be spoken to by members who are abler than I am to deal with them fitly.

On the motion of Dr. LITTLE, the President was thanked for his address. Dr. Little also expressed the pleasure of the members of the Council that Sir Donald MacAlister had thoroughly recovered from his late dangerous illness.

Service Tables.

Tables showing the results of competitions for Commissions in (*a*) the Naval Medical Service, (*b*) the Royal Army Medical Corps, and (*c*) the Indian Medical Service were received and referred to the Examination Committee for its consideration.

On the motion of Sir CHARLES BALL it was agreed—

> That the thanks of the Council be conveyed to the Director-General of the Medical Department of the Royal Navy, the Director-General of the Medical Department of the Army, and the Under Secretary of State for India respectively, for the returns which they have again furnished to the Council, with the request that such returns may in the future continue to be furnished to the General Medical Council.

Appointment of Committees.

The Council appointed various committees, the Executive Committee being as follows:—The President (chairman), Dr. Norman Moore, Sir Henry Morris, Mr. Tomes, Dr. Langley Browne, Mr. Hodsdon, Dr. Norman Walker, Sir John Moore, and Sir Charles Ball.

Assistant Examiners.

Sir CHARLES BALL moved—

> That the powers vested in the General Medical Council by Section 5 of the Medical Act, 1886, of appointing from time to time examiners to assist at the qualifying examination, held by a medical corporation for the purpose of granting its diploma, conferring the right of registration under the Medical Acts, be delegated, under Section 6 of the Medical Act, 1858, to the Branch Council for the part of the United Kingdom in which such medical corporation is domiciled.

Sir Charles Ball said that by the Medical Act, 1886, it was ordered that no one should receive a registered qualification unless he had passed examinations in medicine, surgery, and midwifery. Previous to that Act there were several licensing bodies which had power to grant qualifications in medicine only, and others which had power to grant qualifications in surgery only. The result of the Act was that certain bodies combined to give a joint diploma which would fulfil the conditions of the Act. There were other licensing bodies which had certain powers to grant qualifications on one branch only, but were unable to enter into a combination. These bodies under the Act might apply to the General Medical Council to appoint assistant examiners to examine in the subject in which they were deficient. A body which was qualified to give a qualification in medicine might have an assistant examiner to give a qualification in surgery. It came about that the bodies put forward to the Council the name of a gentleman for appointment as assistant examiner. His name was published in the programme of business, and as a matter of fact the gentlemen whose names had thus been put forward were elected by the General Medical Council without question. That seemed to him an unsatisfactory way of proceeding, because it would have been a very invidious thing to criticise the merits of the candidate put forward or to suggest an alternative name. At present there were only two bodies which needed the appointment of assistant examiners—the Apothecaries' Society of London and the Apothecaries' Hall of Dublin. Now all that he asked in his motion was that the election should be made by the Branch Council of the country in which the body was situated. The Branch Council had material to know more than the Council did of the candidate and more of the institution which was requiring the assistant examiner. The representative of the body concerned was a member of the Branch Council. Further, the proceedings of the Branch Councils were held *in camerâ* and there was an opportunity of discussing the name put forward if the members of the Branch Council wished to do so. The General Medical Council had thus the guarantee that the name was put forward in a way in which criticism of the merits was possible. He wished to assure the Apothecaries' Society that the names put forward by it had always been worthy of the confidence of the General Medical Council. He was sure that if the society sent up nominations of the same sort in future they would go through as a matter of course. But by the procedure which his motion suggested he felt that the responsibility of the Council was more sufficiently safeguarded.

Mr. WILKS seconded. He said that on behalf of the Apothecaries' Society of London he was instructed to tell the Council that that society had always been most anxious to assist it in doing anything for the benefit of the medical profession. He was instructed unreservedly to second Sir Charles Ball's motion.

The motion was unanimously agreed to.

The PRESIDENT remarked that this motion freed him from the obligations in regard to the appointment of assistant examiners which the resolution of last year placed on him. He was glad of this as he thought it was better that the Council should take the responsibility itself.

Medical Reciprocity with Newfoundland and New Brunswick.

On the motion of the PRESIDENT the following report was received from the Executive Committee:—

(*a*) The Executive Committee reports that Part II. of the Medical Act (1886) having been extended by an Order in Council to the Colony of Newfoundland, it has considered the conditions under which medical qualifications granted in the colony shall be recognised for registration in the Colonial List of the Medical Register of the United Kingdom, and has adopted the following resolution:—

"That any person who holds the licence of the Medical Board of Newfoundland, granted after examination in medicine, surgery, and midwifery, together with the licence to practise in the colony, shall be entitled to be registered in the Colonial List of the Medical Register, provided he satisfies the Registrar of the General Medical Council regarding the other particulars set forth in Part II. of the Medical Act, 1886."

(*b*) The Executive Committee reports that Part II. of the Medical Act (1886) having been extended by an Order in Council to the Province of New Brunswick, it has considered the conditions under which medical qualifications granted in the province shall be recognised for registration in the Colonial List of the Medical Register of the United Kingdom, and has adopted the following resolution:—

"That any person who holds the licence of the Council of Physicians and Surgeons of the Province of New Brunswick, granted after examination in medicine, surgery, and midwifery, together with the licence to practise in the province, shall be entitled to be registered in the Colonial List of the Medical Register, provided he satisfies the Registrar of the General Medical Council regarding the other particulars set forth in Part II. of the Medical Act, 1886."

Master of Surgery of Punjab University.

On the motion of the PRESIDENT a report was received from the Executive Committee directing the Registrar to add the degree of M.S. of the Punjab University to those granted by that University to which recognition had been previously accorded.

The Finance Report.

Mr. TOMES presented the report of the Finance Committee, which showed that the income of the General and Branch Councils for the year ending Dec. 31st, 1913, was £8332 11*s.* 4*d.* The expenditure was £6687 4*s.* 11*d.*, and consequently there was a surplus of £1645 6*s.* 5*d.* The expenditure, which was £942 less in 1912 than in 1911, showed a further decrease of £486 in 1913. Once more the cost of the sessions was less than in former years. From the foregoing it will be seen that the larger surplus this year results not from increased receipts but from diminished expenditure. The committee notes that the number of students registered during 1913 was 1480. This is an increase of 83 over the number registered in 1912, and compares favourably with the average of 1420 per annum for the past five years. The number of dental students registered during 1913 was 361. The average number registered from 1899–1903 was 197; from 1904–1908 was 240; from 1909–1913 was 313. Mr. Tomes went on to comment on the satisfactory nature of the report. The happy financial position in which the Council found itself was due to the expedition with which recent sessions had been conducted.

It was agreed to receive the report.

The Council then adjourned.

WEDNESDAY, MAY 27TH.

The Council considered the case of Mr. H. Chatterjee, L.R.C.P. and S. Edin., L.R.F.P.S. Glasg., who was charged with infamous conduct in a professional sense, the complainants being the British Medical Association. The Council on adjourning for the day had not concluded its consideration of this case.

POOR-LAW MEDICAL OFFICERS' ASSOCIATION OF ENGLAND AND WALES.—The report of the council on the Poor-law Institutions Order, 1913, expresses the opinion that this Order inaugurates many valuable changes, among which may be mentioned the exclusion of children from the mixed workhouse, and the better classification of the inmates of Poor-law institutions. The council cannot, however, approve of some of the new medical recommendations. Much additional work is thrown upon indoor Poor-law medical officers without any increase in their salaries, a matter upon which the Order says nothing. The clerical work is enormously increased, while the repeated examination of healthy children will add much to the medical officer's routine work. The chief point where, in the opinion of the council, this Order is retrograde is an old grievance and deals with control. The necessity of medical control in Poor-law institutions for the sick has always been insisted upon by the association; but in this Order the medical officer as regards subordination to the workhouse master is in a worse position than in the past. The old Order, making it the duty of the master to take care that all sick and insane inmates and infants are duly visited by the medical officer, is continued. This is a duty the master is not competent to perform, and the council much regrets that the opportunity was not taken to omit it entirely. The position of the medical officer should be that of a chief official directly responsible to the house committee and the guardians. Further, the council is quite unable to approve of any system that places the control of the sick wards in the hands of a non-medical officer. To subordinate the medical and nursing staff to such an official is, in its opinion, radically wrong, and should not be permitted. The sick wards in workhouses should be separated from the rest of the institution and put under the control of the medical officer, to whom the superintendent nurse must be responsible. The workhouse master should act as steward under the medical officer, but should be relieved from all other administrative duties and responsibilities in the sick wards. The council is of opinion that unless both the status and the remuneration of the workhouse medical officer are improved the existing difficulty of obtaining such officers will be very considerably increased. Again, all drugs and appliances for the sick poor should be provided by the guardians, yet in this latest Order the guardians are still permitted to contract with their medical officers to supply them. Difficulties, too, are likely to arise on account of the compulsion put upon all medical officers to produce books, documents, or accounts whenever required by the clerk.

Obituary.

SIR FRANCIS LAKING, BART., G.C.V.O., K.C.B., M.D. HEIDELB., LL.D. ABERD., M.R.C.P. LOND.,

PHYSICIAN-IN-ORDINARY AND SURGEON-APOTHECARY TO HIS MAJESTY; CONSULTING PHYSICIAN TO THE VICTORIA HOSPITAL FOR CHILDREN AND TO THE GORDON HOSPITAL FOR FISTULA.

Sir Francis Laking passed away in London on May 21st. He was an example of the distinction which character, courtly demeanour, and unusual tact can attract no less than of that which comes to the distinguished scientist.

SIR FRANCIS LAKING, BART.

(*From a photograph by Lafayette, Limited*)

Francis Henry Laking was born on Jan. 9th, 1847. He received his medical education at St. George's Hospital and at Heidelberg. He qualified as L.R.C.P. in 1868. In 1869 he became L.S.A., and also took the M.D. degree at the University of Heidelberg. From 1869 to 1870 he was house physician, and from 1871 to 1874 medical registrar at St. George's Hospital, to which he subsequently became visiting apothecary. In 1872 he became a Member of the Royal College of Physicians. For a time he served on the visiting medical staff of the Victoria Hospital for Children, and was subsequently elected consulting physician. He began practice in partnership with the late M. du Pasquier apothecary to the Royal Household which proved the stepping-stone to his subsequent career as a Court physician. On the death of his partner Dr. Laking succeeded him as apothecary-in-ordinary to Queen Victoria, and held the same office to the Royal Household, the Prince of Wales (afterwards King Edward VII.), and H.R.H. the Duke of Edinburgh, as well as being physician-in-ordinary to T.R.H. the Duke and Duchess of Connaught and to T.R.H. Prince and Princess Christian of Schleswig-Holstein. When King Edward came to the throne Sir Francis Laking, who had been knighted by Queen Victoria in 1893, continued to hold the confidence of his sovereign and retained his post, and he attended the King during his illness in 1902, in conjunction with the other distinguished medical men, Lord Lister, Sir Thomas Barlow, Sir Frederick Treves, and Sir Thomas Smith, who shared with him the care of the nation's anxiety. For this service he was created a baronet in 1902. He remained in constant attendance on the King, and with Sir James Reid was with him through his last illness and was present at his death-bed, continuing to be physician-in-ordinary to Queen Alexandra subsequently. In 1903 he was promoted to the rank of Knight Grand Cross of the Victorian Order, and in the same year received the Grand Cordons of the Portuguese Order of the Immaculate Conception and of the Crown of Italy, to which was added in 1904 that of the Royal Order of the Dannebrog. He became in that year also a Commander of the Legion of Honour, and was in the following year promoted to the rank of a Grand Officer of the Legion. Other decorations conferred on him were the First-class Gold Order of Merit of Turkey, the Grand Cordons of the Polar Star of Sweden and of St. Olaf of Norway, and the Knight Commandership of the Order of the Saviour, of Greece. In 1910 he was created a K.C.B. On the accession of King George Sir Francis Laking was continued in his office of physician-in-ordinary and surgeon-apothecary to His Majesty and surgeon-apothecary to the Household. He had thus the remarkable distinction of being the ordinary medical attendant of three successive sovereigns. His contributions to medical literature were not numerous, but he was the author of a paper on Indican in the Urine which appeared in the St. George's Hospital Reports.

Sir Francis Laking married in 1873 Emma, daughter of Mr. Joseph Mansell, and in 1905 Eleanor Mary Angerstein, daughter of the late Mr. James Hackworth, of Dunedin. He is succeeded in the baronetcy by his son, Mr. Guy Laking, M.V.O., who is a distinguished antiquary, and the Keeper of the King's Armoury.

PHILIP HENRY PYE-SMITH, M.D. LOND., HON. M.D. DUB., F.R.C.P. LOND., F.R.S.,

CONSULTING PHYSICIAN TO GUY'S HOSPITAL.

BY the death of Dr. Philip Henry Pye-Smith, which took place on May 23rd, at 26, Hyde Park-square, London, after a long illness, the medical profession has lost a distinguished member and Guy's Hospital one of the band of scientific physicians who in the later years of the nineteenth century followed in the footsteps of Bright and Addison.

Born in 1840, he was the son of Mr. Ebenezer Pye-Smith, F.R.C.S., and grandson of the Rev. John Pye-Smith, D.D., F.R.S. His early student life was passed at Mill Hill School, and later he studied medicine at Guy's Hospital, subsequently visiting the Paris and other continental medical schools. Having taken the Arts degree of the University of London, he proceeded to the M.D. degree of that University in 1864, taking the gold medals in medicine and surgery, and in the following year was appointed lecturer in comparative anatomy at Guy's Hospital Medical School. He afterwards successively held the posts of lecturer in practical physiology, demonstrator of cutaneous diseases, and lecturer in clinical medicine till 1899, when he retired from the hospital staff. He was appointed assistant physician to Guy's Hospital in 1872, was promoted to full physician in 1884, and was elected consulting physician in 1899. In 1870 he was elected a Fellow of the Royal College of Physicians of London, and on many occasions between the years 1875 and 1888 was an examiner for the College. From 1888 to 1890 he was a member of the Council, and in 1893 he delivered the *Harveian Oration*. In 1894, 1895, and 1899 he served as Censor, and from 1902 to 1908 he was the representative of the College on the Senate of the University of London.

PHILIP HENRY PYE-SMITH.

In 1899 Dr. Pye-Smith was appointed by the British Government joint representative with Sir Heron Maxwell at the International Congress on Tuberculosis in Berlin, and the conclusions,[1] which he appended to the joint report in the form of a memorandum to a Parliamentary paper, are well worth reading as showing the point that had been reached in our knowledge of the causes and conditions of tuberculosis a decade and a half ago. He concluded by saying that "The prospect of improved success in the treatment of tuberculosis in general, and of consumption in particular, by the advance of pathology and the progress of surgery and medicine is a hopeful one, almost as hopeful as that of limiting the spread of the disease by preventive measures."

Dr. Pye-Smith, who was a former Vice-Chancellor of the University of London, was an honorary Fellow of the College of Physicians of Philadelphia and of the Royal Academy of Medicine in Ireland, and a governor of Shrewsbury and St. Paul's Schools. His literary work included a Syllabus of Lectures on Physiology with Tables and Diagrams (1885), an Address to the Department of Anatomy and Physiology at the British Association (1879), the Address in Medicine at the British Medical Association (1900), the Lumleian Lectures on Etiology (1895), and an Introduction to the Study of Diseases of the Skin (1893). He was also joint author with the late Dr. Fagge of an excellent "Text-book of the Principles and Practice of Medicine," the fourth edition of which was published in 1901. "Fagge and Pye-Smith" is now less well known to the younger generation of practitioners, but in its day it deservedly ranked very high, especially as a text-book of medicine for students reading for the higher examinations. Dr. Pye-Smith was the author also of the article on Harvey in the "Encyclopædia Britannica," on Pneumonia in Allbutt's "System of Medicine," and among his other contributions were: An Analysis of 680 Cases of Rheumatism and Allied Diseases; Xanthelasma; Idiopathic Anæmia, with 100 Cases; and on Prognosis (Guy's Hospital Reports, 1874–1887); Observations on Division of the Cervical Sympathetic, in the *Journal of Physiology*, Vol. VIII.; Anæmia Idiopathica Perniciosa, in *Virchow's Archiv* (1875); and Venesection, in the *Medico-Chirurgical Transactions* (1891).

A colleague writes:—"Philip Henry Pye-Smith, although arrived at a good age, has yet, as it might seem, gone from us all too soon, for he was possessed of that clear complexion and open countenance that had withstood well the ravages of time, and his last lingering illness must have come suddenly and unexpectedly to many of his friends. As a teacher his mind was well stored with information; it was firmly based upon experience and observation gained at home and in continental schools, and his method of teaching was precise and dogmatic. Thus he became a successful teacher at the bedside, and he carried through several editions the text-book on medicine written by his colleague, the late Dr. Hilton Fagge, and first published not long before that lamented physician's death. He added moreover considerably to his reputation as a physician by bestowing his attention upon diseases of the skin, of which specialty he took charge for some years as an assistant physician at Guy's Hospital. To this study as well as to general medicine he made many important contributions, and in it his interest never flagged. But although he has thus left his mark upon the medicine of his day, his bent and recreation seemed perhaps more to lie amid scientific subjects of more general interest, and his friends and associates were learned men of that ilk—Huxley, Michael Foster, and Gull, for example, in their day—and this was so more or less throughout his life. He was fond of old authors and old books, and would often quote from them. He was a good speaker, and could always be trusted on an important occasion to say the right thing and to say it well, and being a man of affairs he was one whom his friends might have hoped, had his health not given way, would at some time have been called upon to fill the presidential chair of the Royal College of Physicians. He was always courteous, always genial, a kindly host given to a somewhat old-time hospitality where he was to be seen at his best, and perhaps most endearing of all he was a most unselfish and generous man, ever ready to help a friend or younger colleague in the struggle upwards towards success."

---

[1] THE LANCET, vol. ii., 1899, p. 177 et seq.

THE NATIONAL INSURANCE ACT.

THE SOCIETY OF APOTHECARIES AND UNQUALIFIED PRACTICE.

THE following resolution has been passed by the Court of Assistants of the Society of Apothecaries of London:—

> Resolved that this Court regrets that in Paragraph 44 (2) of the regulations dated Jan. 10th, 1914, made by the National Health Insurance Joint Committee, acting jointly with the Insurance Commissioners, and the Memorandum issued in connexion therewith, provision is made whereby insured persons making their own arrangements for medical treatment under Section 15 (3) of the National Insurance Act, are allowed to obtain treatment from unqualified persons. Further, that this Court strongly objects to public money being paid for the encouragement of unqualified medical practice, and begs to draw the attention of the General Medical Council to the matter.

LONDON PANEL COMMITTEE.

The Panel Committee for the county of London have decided that duly qualified medical practitioners and representatives of the medical press shall be admitted to all meetings of the committee, provided that the committee, by resolution, may temporarily exclude such persons whenever such exclusion is advisable. The meetings of the committee are held in the Board Room at the offices of the Metropolitan Asylums Board, Victoria Embankment, E.C., on the fourth Tuesday in each month, at 3 P.M.

A FRIENDLY SOCIETY AND THE ACT.

At the forty-fifth annual meeting of the National Deposit Friendly Society at Sheffield the president, in moving the adoption of the report, spoke of the position of the society as "very satisfactory." Dealing with the position of the society with regard to the working of the Act, he said if they compared the amounts paid out in each branch of the State section with the estimates made by the Government actuary it would be found that the accounts came out on lines completely satisfactory as far as their society was concerned. Statements had been made reflecting upon some of the Approved Societies to the effect that they had gone entirely beyond the actuaries' estimates, and that they were in a hopeless and insolvent position. That was by no means the experience of their society. No doubt the increase in sick pay went on in both the State and deposit sections. He did not attribute it all to malingering, but it was nevertheless no use shutting their eyes to the fact that there had been considerable malingering. Later in his speech the chairman observed that "there was no doubt some degree of laxity and looseness on the part of doctors which required to be carefully watched"; and with regard to the general working of the Act, including no doubt the control of the medical men engaged upon it, it was suggested by him that "the Government would find that the best way was to entrust large and reliable Friendly Societies with the work on proper lines subsidised by the State."

ELGIN AND NAIRN INSURANCE COMMITTEE.

At a recent meeting of the Elgin and Nairn Insurance Committee a protest was raised on behalf of the medical men on the panel against the manner in which they were being subjected to loss owing to the failure of the societies to trace removals. The clerk, in a statement of payments made by the Commissioners in respect of the various benefits administered by the committee, had intimated that the distribution in respect of medical benefit to the panel would amount to 95 per cent. of the funds due and that the full amount could not be paid. The protest was then made by Dr. J. Taylor, who pointed out that the fact that the full amount due could not be paid amounted to an admission of insolvency. This was partly due to the failure of the Approved Societies in connexion with their index slips, the result of which was that medical men expecting a substantial cheque for the heaviest working quarter received instead lists of patients who had been struck off their lists and who were not to be paid for. These were people for whom no index slips had been returned by the societies. He had himself been attending a woman who had lived in the same house for ten years and yet who had been crossed off as unidentified by the clerk of the committee because no index slip had been returned for her. Another patient had been taken off his list whom he had recently operated on in a hospital after attending him about 100 times. Cards were sent out and returned by the post-office undelivered and the patients were struck off. This had happened in the case of his own chauffeur, who had moved to an address 40 yards away from his former one. There were scores of such untraced persons who to his knowledge were still in the town. The chairman characterised the statement made by Dr. Taylor as a moderate one, and Dr. Atkinson added that the medical profession had carried out its side of the bargain, and that the medical men were not responsible for the index slips, which were none of their business. Dr. Taylor further extracted a reply from the clerk to the effect that insured persons even when they had been struck off a list were entitled to medical treatment if they became ill. The matter was dropped without any conclusion being arrived at, but the subject will no doubt be discussed again in other districts. Medical men who accept the remuneration offered by Insurance Committees do so because the payments on behalf of persons who do not consult them compensate them for attendance upon the sick at a rate of pay which would otherwise be unremunerative. Those, therefore, who are taken off their lists because they have not been traced represent a dead loss. If they remain well no payment is made in respect of them; if they become ill attendance upon then at insurance rates is expected.

Hull Insurance Committee.

At a recent meeting of the Hull Insurance Commiteee it was reported that as the result of a conference between members of the Medical Benefit Subcommittee and the Insurance Commissioners payment by way of advance was recommended to medical men on the panel at the rate of 1*s.* 6*d.* for each person on their lists on Jan. 12th, and to druggists of 75 per cent. of their accounts as assessed for the two months ending March 12th, provided that the total amount of such payments did not exceed 95 per cent. of the amount estimated to be available on the provisional credit advised by the Commissioners.

Fife Panel Doctors.

At a meeting of the Fife County Insurance Committee held at Kirkcaldy a statistical report was submitted showing that 8000 insured persons on the medical practitioners' lists had not been paid for by the committee. The clerk was instructed to press the Commissioners for payment.

University College, London.—The title of emeritus professor of clinical surgery has been conferred upon Sir Rickman J. Godlee, President of the Royal College of Surgeons of England, and Mr. Bilton Pollard.

King Edward VII.'s Hospital, Cardiff.—At a joint meeting of the chairmen of the various committees of this hospital, held this week, it was decided to accept the resignations of the three house surgeons at present in residence. Differences had arisen, we are informed, owing to a recent increase of £40 per annum in the salary of the house physician without similar recognition of the house surgeons, who hold a similar status in the hospital.

Hospital for Nervous Diseases, Belfast.—At the annual meeting of the supporters of this hospital held on May 19th the report showed that during the year 33 patients had been treated in the intern department, while in the out-patient department a larger number of cases had been seen than formerly, involving 3830 attendances. Dr. John Thompson has been appointed physician in place of the late Dr. John MacCormac, and Dr. John Rusk assistant physician. Financially, there is a deficit of £573 14*s.*

Medical News.

University of Cambridge.—The following medical degrees have been conferred:—

M.D.—W. L. Murphy, St. John's; and C. H. S. Taylor, Caius.
M.B., *B.C.*—G. Moore, Clare.
M.B.—A. G. G. Thompson, Pembroke.

W. Morley Fletcher, M.D., Trinity, has been approved for the degree of Sc.D. The first and second examinations for medical and surgical degrees will begin on Monday, June 15th, the third examination, Part I., on June 16th, and Part II. on June 17th. The examination for the degree of M.C. will begin on June 18th.

Society of Apothecaries of London.—At examinations held recently the following candidates passed in the subjects indicated:—

Surgery.—W. Bailey Thomson (Sections I. and II.), Aberdeen; A. R. Jennings (Section I.), St. Bartholomew's Hospital; and W. Smith (Sections I. and II.), Durham.
Medicine.—W. Bailey Thomson (Section I.), Aberdeen; M. P. Des Santos (Section II.), Louvain; and G. Mes (Sections I. and II.), Amsterdam.
Forensic Medicine.—W. Bailey Thomson, Aberdeen; L. Baumgarten, Berne and London Hospital; G. Mes, Amsterdam; H. Morrison, St. Mary's Hospital; and B. C. Piercy, Leeds.
Midwifery.—W. Andrew, King's College Hospital; W. Brown, King's College Hospital and Oxford; and R. J. Hearn, Guy's Hospital and Cambridge.

The Diploma of the Society was granted to the following candidates, entitling them to practise medicine, surgery, and midwifery:—

B. C. Piercy and W. Smith.

Sir William Osler, Regius professor of medicine in the University of Oxford, will open the new Pathological Laboratory of the Royal Mineral Water Hospital, Bath, on Thursday, June 4th, at 4 o'clock.

St. Thomas's Hospital: Annual Prize Distribution.—The prizes will be distributed to the successful students of this hospital by Sir T. Clifford Allbutt, K.C.B., Regius professor of physic in the University of Cambridge, on Tuesday, June 30th.

Royal Sanitary Institute.—The following medical practitioners have this month been elected members of the institute: Dr. Sydney James Clegg (Newcastle-on-Tyne), Dr. Josephine Letitia Denny Fairfield (Hampstead), and Dr. Alexander L. McQuarrie (British Columbia).

Portsmouth Radium Fund.—The Portsmouth guardians, having obtained the necessary consent of the Local Government Board, have contributed £100 to the Portsmouth *Evening News* Radium Fund. This now amounts to £2134 7*s.* 9*d.*

Kingseat Asylum Extension.—A scheme for the extension of Kingseat Asylum, Aberdeen, has been passed by the Aberdeen District Lunacy Board. This scheme comprises a combined hospital villa for both sexes, at an estimated cost of £12,250, or £139 per bed, this cost being exclusive of furnishings or architect's fees.

A "Royal" Infirmary for East Lancashire.—The King has granted permission to the Blackburn and East Lancashire Infirmary to be known as the Blackburn and East Lancashire Royal Infirmary. The endowment fund investments are now £95,920, which gives a yearly income of £2872. The patients admitted last year numbered 7666.

Medical Sickness and Accident Society.—A meeting of the executive committee of this society was held at 429, Strand, W.C., on May 15th, Dr. F. J. Allan being in the chair. The accounts showed satisfactory progress both in the matter of new claims and new proposals. The new tables were reported as being duly registered, and proposals are already coming in under them.

Presentation to a Medical Man.—The Paignton branch of the Great Western Railway employees of the St. John Ambulance Association at the annual distribution of certificates and medallions held recently at Exeter, presented Mr. Robert Dunstan, M.R.C.S. Eng., L.S.A., with a handsome walking stick in appreciation of his services as honorary instructor.

NORTHERN ASSOCIATION OF MEDICAL WOMEN.—A meeting of this association was held at the Medical Institution, Liverpool, on May 23rd. Delegates were present from Manchester, Leeds, Sheffield, and Preston. After a discussion on the National Care of Maternity the following resolution was passed unanimously:—

> That this meeting is of opinion that it is necessary for the welfare of the working women of this country that efficient pre-maternity and maternity care should be provided, including any necessary institutional treatment; and that for the proper coördination of existing organisations for ante-natal and post-natal care the administration of the maternity benefits should be handed over to the public health authorities.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

Workmen's Compensation.

A HIGHLY important announcement that the Government is to set up a Committee to inquire into the Workmen's Compensation Act in all its aspects, and also into its relationship to the National Insurance Act, was made by Mr. ELLIS GRIFFITH, the Under Secretary of State for the Home Department, in the House of Commons on the evening of Wednesday, May 20th.

This announcement was made in reply to a debate on a motion brought forward by Mr. TYSON WILSON to the effect "that in the opinion of this House a Committee should be appointed to consider and report upon the anomalies that have been created in the administration of the Workmen's Compensation Act." In the course of the discussion the subject of medical referees was referred to.

Mr. ELLIS GRIFFITH, in the course of his reply, said that the point which the Labour Members had put was that there ought to be full-time medical referees under the Workmen's Compensation Act. All honourable members would agree in theory that if it was at all practicable that ought to be so. They were anxious to get men who would be full-time medical referees because they would be able to give an absolutely impartial opinion as between employer and employed. At present these medical referees were appointed for each county court district. The first thing that would have to be done if a change were adopted would be to get these areas extended. It would be impossible to get the very best men unless they were attracted by a larger salary than was afforded by a small district. Honourable members knew how careful the Home Office had been in sending out circulars that the medical referee should not be interested in the case, and that he ought to go to it with an impartial and unbiased mind.

Mr. HODGE: Lord Gladstone when he was Home Secretary promised, as an experiment in some of the larger districts, to employ full-time medical referees. It has never been done.

Mr. ELLIS GRIFFITH admitted that that promise had never been fulfilled. He did not see why it should not be possible to do it in a very large district. These points, however, were of relatively less importance than the announcement which he was going to make. He was prepared to accept the motion. The Government thought that a Committee should be appointed to consider not only the administration of the Act but also its alteration. Honourable Members all knew that a new factor had come into existence with the National Insurance Act, and just as Labour members wanted a State paid service of medical referees, so there had been a suggestion on foot that there should be a State insurance of employers against compensation risks of all kinds. That was to say, that instead of insuring in private companies for one class of cases and by their National Insurance contributions for another class of cases there should be some organisation whereby employers could pay once for all and protect themselves against disablement, illness, and all these other matters. The proposal of the Government was that they were going to appoint a Committee to inquire not only into existing anomalies, but also into the relationship between the Workmen's Compensation Act and the National Insurance Act, with the view, if possible, of bringing these two matters into more harmonious relationship.

The Whitsuntide Recess.

Parliament has adjourned for the Whitsuntide recess. The House of Commons is taking a fortnight's holiday, but the House of Lords does not reassemble until June 15th.

HOUSE OF COMMONS.

WEDNESDAY, MAY 20TH.

National Insurance Grants to Ireland.

Mr. CASSEL asked the Chancellor of the Exchequer what proportion of the grants of £1,250,000 for the year 1914–15, and of £2,000,000 for the year 1915–16, for National Health Insurance, tuberculosis nursing and pathological laboratories it was estimated would be attributable to Ireland.—Mr. LLOYD GEORGE wrote in reply: The figures may be stated provisionally as follows:—

	1914–15.		1915–16.
National Insurance	£52,000	...	£65,000
Tuberculosis nursing and pathological laboratories	£22,500	...	£67,500
	£74,500		£132,500

Medical and Surgical Appliances.

Lord NINIAN CRICHTON-STUART asked the Chancellor of the Exchequer whether there were any industries or avocations in which there was particular danger of particular kinds of accidents happening, or diseases being contracted, for which the National Health Insurance Committees were allowed to supply any particular kinds of medical instruments or necessities.—Mr. HOWARD (on behalf of Mr. LLOYD GEORGE) answered: The medical and surgical appliances which Insurance Committees are empowered to supply as part of medical benefit are those specified in the second schedule to the Regulations. These are available in suitable cases for the treatment of diseases or accidents, whether arising as a result of the insured person's employment or otherwise.

Miners' Itch and Industrial Diseases.

Mr. WEDGWOOD asked the Home Secretary whether his attention had been called to the Milroy lectures, delivered by Dr. Shufflebotham before the Royal College of Physicians, dealing with miners' diseases, and whether the Home Office contemplated adding miners' itch to those industrial diseases which were covered by the Workmen's Compensation Act.—Mr. McKENNA replied: I have seen a report of these lectures but have otherwise no information in regard to this ailment. It is not mentioned in the report of the Committee on Compensation for Industrial Diseases, and no representations have been made to me on the subject. If, as I gather from the report of the lectures, the ailment cannot be regarded as specific to the employment in the sense indicated by the committee in their report, I could not add it to the schedule in the Workmen's Compensation Act, but any cases of disablement caused by this ailment will be covered by the National Insurance Act.

Medical Inspectors under the Mental Deficiency Act.

Mr. SNOWDEN asked the Home Secretary whether he was aware that the Board of Control for the administration of the Mental Deficiency Act recently advertised for male and female inspectors who must be registered medical persons, and that the salaries offered were £400 for men and £350 for women, and, if so, would he explain why this difference of payment was made, seeing that the Board stated that there was no difference in the importance of the work of the men and women inspectors; whether the first woman candidate offered the post refused it on account of this difference in salary; whether the second candidate accepted it and then withdrew for the same reason; whether the post was still unfilled; and whether it had hitherto been the practice of Government departments to pay medical officers the same salaries, whether men or women; and, if so, why this practice had been departed from in this case.—Mr. McKENNA answered: The salaries offered were £400, rising to £600, and £350 rising to £550. They were fixed by the Treasury at the rates at which it was believed suitable candidates could be obtained. At that time the report of the Royal Commission on the Civil Services had not been published, but the proposed salaries appear to comply with the recommendation of the Commission that where the conditions of employment are approximately the same the rates of pay should approximate to equality. The first two candidates to whom the post of female inspector was offered declined it on the ground of difference of salary, not because they thought it too small. The post has not yet been filled, but the matter is not at present urgent. There is no rule or practice requiring the salaries of men and women medical officers in the Government service to be the same.

Mr. SNOWDEN: Is it not a fact that in practice the remuneration of women medical officers is the same as men medical officers?—Mr. McKENNA: I am informed not, but I will inquire further into the point.

Mr. SNOWDEN: Are we to infer from the reply just given that the Treasury consider that the services of women will not be equal in value to the services of the men, and is that the reason there is for this difference of salary? The Report of the Royal Commission to which the right honourable gentleman refers recommended equal pay for equal work.—Mr. McKENNA: The Treasury rule was stated by me. Rates were fixed by the Treasury at which it was believed suitable candidates could be obtained. That, I believe, is the practice of the Treasury. With regard to the second point, the work is approximately the same and the rates are approximately the same, but it cannot be said that the work is identical.

Mr. **SNOWDEN**: Seeing it is impossible to get women doctors at these rates of pay, will they now offer the women the same salary as the men?—Mr. **MCKENNA**: I am not sure what appointments have been made.

Mr. **MACCALLUM SCOTT**: Is my right honourable friend aware that a great many distinguished women economists are opposed to the doctrine of equal pay for equal work, and think that it would result disastrously to the interests of women?—Mr. **MCKENNA**: I agree with what my honourable friend says. For my own part, I should be ready to give equal pay for equal work, but I am not convinced the work is equal.

Midwives (Scotland) Bill.

Mr. **BARNES** asked the Prime Minister whether, in view of the passing through all its stages by the House of Lords of a Bill for the training and registration of midwives in Scotland, and in view of the need of such a Bill becoming law, he would favourably consider the question of giving facilities either for the Bill in question or for that standing in the name of the Member for the Blackfriars division of Glasgow.—Mr. **ASQUITH** said in reply: The Government are favourably disposed to the principles of the Bill and will consider whether facilities can be given for its progress.

The Nursing Home at Sierra Leone.

Mr. **MACCALLUM SCOTT** asked the Colonial Secretary whether the Manchester Chamber of Commerce had appealed to the Governor of Sierra Leone requesting that Europeans entering the nursing home might continue to enjoy the services of their own medical attendant, whether native or European; and could he say what reply had been sent to this request.—Mr. **L. HARCOURT** replied: I do not know what reply has finally been returned by the Governor of Sierra Leone to the letter from the Manchester Chamber of Commerce to which my honourable friend refers, but I have decided that the native medical practitioner to whose case the Chamber of Commerce specially referred shall continue to be allowed the same facilities for attending his patients in the nursing home that he has hitherto enjoyed, subject to the privilege being liable to be withdrawn at any time for good cause shown.

Sale of Food and Drugs Bill.

Sir **PHILIP SASSOON** moved for leave to introduce a Bill "to consolidate with amendments the Food and Drugs Act, 1875 to 1899, the Margarine Act, 1887, and the Butter and Margarine Act, 1907." He said that the object of the Bill was to consolidate into one consistent and comprehensive whole all the existing statute law governing the subject with which it dealt. The Bill also proposed certain amendments of the existing law. At present the powers of officers under the Food and Drugs Acts to purchase and to take samples of articles of food or drugs for the purpose of analysis were restricted to articles or drugs which were, or actually had been, exposed for sale. The present Bill gave power to take samples for analysis at any time after the process of manufacture or preparation for consumption was completed. Further, the powers now possessed by the Local Government Board of fixing by regulations the standards of purity of, and use of preservatives in certain articles were extended to all articles affected by the Bill. An even more important change was a proposal to set up a committee of 15 persons of a representative character to advise the Board in the passing of these regulations. The existing provisions relating to the defence of warranty had also been revised with the intention of making it more difficult for the seller of an impure or adulterated article to escape the proper consequences of his act. Additional innovations dealt with the compulsory registration of vendors of milk and butter, the infliction of imprisonment for repeated offences, exemption of officers from the necessity of entering into recognisances, and the granting of analysts' certificates. These changes, he believed, would be for the public benefit.

Leave having been granted Sir **PHILIP SASSOON** brought in the Bill, which was read a first time.

Preservatives in Cream.

Colonel **IVOR PHILIPPS** asked the President of the Local Government Board whether his attention had been called to the risk and loss to which respectable and honest retail traders were at present exposed owing to the uncertainty as to the law regarding the sale of preserved cream; and whether he proposed to take immediate steps to relieve traders from the constant danger to which the present law exposed them.—Mr. **HERBERT SAMUEL** wrote in reply: My attention has been drawn to this matter. The evidence at present available as to the influence on health of the addition of small quantities of preservatives to cream is to some extent contradictory. I have decided, therefore, to nominate a small expert committee to investigate afresh the question which I recognise to be of great and pressing importance to the trade concerned. Pending the completion of this investigation, which should not be prolonged, I would venture to express the opinion that it is inadvisable that local authorities should institute proceedings except in cases where the amount of boric acid in the cream exceeds the amount declared on the label or where the amount so declared is clearly excessive.

Miners' Nystagmus.

Mr. **WEDGWOOD** asked the Home Secretary whether his attention had been called to the evidence given by Dr. Shufflebotham in his Milroy lectures before the Royal College of Physicians that miners' nystagmus was principally due to the bad illumination of mines; whether the Home Office concurred in his views on this subject; and whether any steps could be taken to remedy the evil in connexion with the National Insurance Act or otherwise.—Mr. **MCKENNA** answered: I have seen a report of the lectures referred to. The researches made in recent years appear to point strongly to the conclusion that the working in insufficient light is the main, if not the sole cause of miners' nystagmus, and the point was kept in view when it was decided to impose photometric tests for all types of safety lamps approved under the Coal Mines Act, 1911. I am advised that as a result of these tests and the increasing use of electric lamps the illumination below ground is improving, and I trust that as this improvement continues it will have a substantial effect in reducing the number of cases of nystagmus. Miners' nystagmus is one of the diseases scheduled under the Workmen's Compensation Act.

Operations in Prison.

Mr. **WEDGWOOD** asked the Home Secretary to state under what law or regulation the consent of a prisoner had to be obtained before an operation could be performed by the prison or other doctors.—Mr. **MCKENNA** answered: There is no express provision of the law and no regulation requiring the prisoner's consent, but it is the invariable practice to obtain the prisoner's consent before a surgical operation is performed in prison.

Asylums Officers Bill.

Viscount **WOLMER** asked the Prime Minister whether his attention had been called to the recent unrest among asylum attendants in different parts of the country, particularly in Lancashire; and whether he would afford facilities this session for the passage of the Asylums Officers (Employment, Pensions, and Superannuation) Bill, which had already been approved by the Select Committee appointed to consider it in 1911.—Mr. **ASQUITH** replied: I am informed that there is no widespread unrest, though some dissatisfaction does undoubtedly exist. As regards the latter part of the question the Government are favourable to the principles of the Bill, and will consider whether the business of the House will admit facilities for its progress.

MONDAY, MAY 25TH.

A Complaint before the General Medical Council.

Mr. **ANEURIN WILLIAMS** asked the Home Secretary whether he was aware that about 1200 householders in or about Annfield Plain, county Durham, were members of a medical association who had made with a certain medical man in their neighbourhood an arrangement satisfactory to themselves and to the said medical man; whether the said medical man was threatened with being struck off the Medical Register because he was working for an association which it was alleged had canvassed; whether the alleged canvassing was denied by the association in question; whether the case would be heard before the General Medical Council in London on Wednesday this week; whether the charge against this association and their doctor was being supported by certain other doctors; whether in the event of the view put forward by these other doctors being accepted the doctor of the association would be struck off the medical list without enjoying any right of appeal; whether in these circumstances, and in view of the importance of the matter to the working classes, the Home Secretary would take steps to see that the matter was not decided without a full and impartial inquiry into all the facts of the case.—Mr. **MCKENNA** answered: I have received this morning a letter on the subject from a correspondent in Durham, but I have no other information. Assuming the facts to be as stated by my honourable friend, I do not think *primâ facie* that I have any authority to take action.

Mr. **ANEURIN WILLIAMS**: Will the right honourable gentleman inform me whether there is any power to get an impartial decision on this matter, or whether the powers of the General Medical Council are absolute in a matter which evidently concerns themselves?—Mr. **MCKENNA**: I should think that if the facts are as stated by my honourable friend the remedy can only be obtained by a fresh statute.

An Experiment on an Animal.

Mr. **CHANCELLOR** asked the Home Secretary whether, as stated in the King's Bench Divisional Court on Monday last, the Home Office had expressed entire satisfaction with the conduct of Dr. Yorke in exposing for several days in an open field a donkey covered with sores due to experiments made upon it in the laboratory, and only destroying it after complaint had been made to the police in consequence of the swarm of flies observed from the other side of the hedge to be flying about and settling upon the animal, and what steps he proposed to take to prevent other animals being subjected to similar treatment.—Mr. McKenna replied: The statement reported to have been made in court that the Home Office had expressed itself as entirely satisfied with Dr. Yorke's conduct was incorrect. I expressed no such view. Careful inquiry was made by me at the time; I saw no ground for differing from the conclusion of the justices, who found that the allegations as to the condition of the animal which are repeated in the question were not substantiated, and that the animal was not in fact caused unnecessary pain; but I formed the opinion that Dr. Yorke should himself have visited the animal from time to time, and should have satisfied himself by personal inspection that it was being properly cared for, and I have so informed him.

Appointments.

Successful applicants for vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward to The Lancet *Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week, such information for gratuitous publication.*

Bramwell, Hugh Ransom, M.B. Edin., M.R.C.S., has been appointed Chief Clinical Assistant in the X Ray Department at the West London Hospital.

Burt, W., M.R.C.S., L.R.C.P. Lond., has been appointed House Physician at the Royal Free Hospital.

Carlill, Hildred B., M.D. Cantab., M.R.C.P. Lond., has been appointed Assistant Physician to the West End Hospital for Diseases of the Nervous System, Welbeck-street, W.

Pitts, Arthur T., M.R.C.S., L.R.C.P. Lond., L.D.S., has been appointed Dental Surgeon to the Hospital for Diseases of the Throat, Golden-square.

Prentice, H. Ridley, M.B., B.S. Lond., M.R.C.P. Lond., has been appointed Physician to Out-patients at the West End Hospital for Diseases of the Nervous System.

Ranken, David, M.S. Lond., B.S. Durh., F.R.C.S. Eng., has been appointed Assistant Surgeon to the Hospital for Sick Children Newcastle-upon-Tyne.

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index).

Aberdeen University.—Lectureship in Public Health. Salary £400 per annum.

Auckland Rural District Council.—Medical Officer of Health. Salary at rate of £500 per annum.

Barrow-in-Furness, North Lonsdale Hospital.—House Surgeon. Salary £150 per annum, with residence, board, and laundry.

Bedford County Hospital.—Assistant House Surgeon. Salary £80 per annum, with board, lodging, and laundry.

Belgrave Hospital for Children, Clapham-road, S.W.—House Surgeon for six months. Salary at rate of £75 per annum, with board, residence, and washing.

Birkenhead Borough Hospital.—Senior House Surgeon. Salary £120 per annum, with board and laundry.

Birmingham and Midland Eye Hospital.—Locum Tenens Junior House Surgeon. Salary 4 guineas weekly, with board and lodging.

Birmingham, Central Tuberculosis Dispensary.—Assistant Medical Officer. Salary £350 per annum.

Birmingham, City Fever Hospital, Little Bromwich.—Assistant Medical Officer. Salary £160 per annum, with board and residence.

Birmingham General Dispensary.—Resident Medical Officer, unmarried. Salary £220 per annum, with apartments, fire, lights, and attendance. Also Locum Tenens Resident Surgeon. Salary £5 5s. per week, with apartments.

Birmingham Union, Dudley-road Infirmary.—Resident Assistant Medical Officer. Salary £150 per annum, with apartments, rations, laundry, and attendance.

Birmingham, Yardley-road Sanatorium.—Assistant Medical Officer. Salary £250 per annum, with board and residence.

Boston Rural District Council.—Medical Officer of Health. Salary £110 per annum.

Bournemouth County Borough Education Committee.—Assistant School Medical Officer. Salary £300 per annum.

Bradford City Hospital, Leeds-road.—Assistant Resident Medical Officer. Salary £200 per annum, with board and residence.

Bradford Royal Infirmary.—House Surgeon, unmarried. Salary £100 per annum, with board, residence, and washing.

Brighton, Royal Sussex County Hospital.—Assistant House Surgeon, unmarried, for three months. Salary £30, with apartments, board, and laundry.

Bristol Royal Infirmary.—House Surgeon for Throat, Nose, and Ear Department. Salary at rate of £100 per annum, with board, lodging, and laundry.

Burnley, Victoria Hospital.—Two House Surgeons. Salary £135 per annum, with residence, board, and washing.

Bury Infirmary.—Junior House Surgeon. Salary £100 per annum, with board, residence, and washing.

Cairo.—Resident Physician for Mena House Hotel, Pyramids, near Cairo.

Canterbury, Kent and Canterbury Hospital.—House Surgeon and Junior House Surgeon, unmarried. Salaries £100 and £80 per annum respectively, with board, lodging, and washing.

Cardiff, Glan Ely Tuberculosis Hospital.—Resident Medical Officer. Salary £200 per annum, with quarters and maintenance.

Cardiff, King Edward VII.'s Hospital.—House Surgeon for the Ophthalmic and Ear, Nose and Throat Departments. Salary £100 per annum, with board, residence, and laundry. Also Two House Surgeons for six months. Salary at rate of £80 per annum, with board, residence, and laundry.

Central London Ophthalmic Hospital, Judd-street, W.C.—Assistant Surgeon.

Central London Throat and Ear Hospital, Gray's Inn-road, W.C.—Registrar.

Chesterfield and North Derbyshire Hospital.—House Physician. Salary £90 per annum, with board, apartments, and laundry.

City of London Hospital for Diseases of the Chest, Victoria Park, E.—Clinical Assistant in Out-patient Department.

City of London Lying-in Hospital, City-road.—Pathologist and Registrar.

Cumberland County Council.—Three Assistant County Medical Officers. Salary £350.

Devonport, Royal Albert Hospital.—House Surgeon, unmarried. Salary £150 per annum, with board and laundry.

Durham County Hospital.—House Surgeon. Salary £120 per annum, with board and lodging.

East London Hospital for Children and Dispensary for Women Shadwell, E.—Medical Officer to Casualty Department for six months. Salary at rate of £100 per annum, with luncheon and tea. Also House Physician. Salary at rate of £75 per annum, with board, residence, and laundry.

Eccles and Patricroft Hospital.—House Surgeon. Salary £70 per annum, with board, washing, and lodging.

Egypt, Public Health Department.—Medical Officer, unmarried. Salary at rate of £600 per annum.

Essex Education Committee.—Medical Inspector. Salary £300 per annum.

Evelina Hospital for Sick Children, Southwark, S.E.—House Surgeon for five months. Salary at rate of £75 per annum, with board, residence, and washing.

Fareham, Hants County Asylum.—Third Assistant Medical Officer, unmarried. Salary £250 per annum, with apartments, board, washing, and attendance.

French Hospital, 172, Shaftesbury-avenue, W.C.—Second Resident Medical Officer, unmarried. Salary £60 per annum, with full board and laundry.

Halifax Royal Infirmary.—Second House Surgeon and Third House Surgeon, unmarried. Salary £120 and £100 per annum respectively, with residence, board, and washing.

Hampshire County Council.—Two Assistant County Medical Officers of Health. Salary £300 per annum. Also Tuberculosis Officer. Salary £400 per annum.

Hemel Hempstead, West Herts Hospital.—Resident Medical Officer. Salary £120 per annum, with rooms, board, and washing.

Hospital for Sick Children, Great Ormond-street, London, W.C.—House Surgeon, unmarried, for six months. Salary £30, with board, residence, &c.

Hospital for Women, Soho-square, W.—Resident Medical Officer for six months. Salary at rate of £80 per annum.

Huddersfield, County Borough of.—Assistant Medical Officer of Health (female). Salary £250 per annum.

Hull Royal Infirmary.—Honorary Ophthalmic Surgeon.

Kingston, Canada, Queen's University, Medical Faculty.—Two Assistant Professors. Salary in each case £300 per annum.

King's Lynn, West Norfolk and King's Lynn Hospital.—House Surgeon. Salary £150 per annum.

Leeds Public Dispensary.—Junior Resident Medical Officer. Salary £130 per annum, with board, residence, and laundry.

London Fever Hospital, Liverpool-road, N.—Assistant Resident Medical Officer. Salary £150 per annum, with residence and board.

London Homœopathic Hospital, Great Ormond-street and Queen-square, Bloomsbury, W.C.—Physician to Hospital. Also Physician for Diseases of Children. Also Assistant Pathologist (Part-time). Salary £50 per annum.

London Lock Hospital.—House Surgeon to Female Hospital, Harrow-road, W. Salary £100 per annum, with board, residence, and washing.

Macclesfield General Infirmary.—House Surgeon. Salary £125 per annum, with residence, board, and laundry.

Maidstone, Kent County Asylum.—Fourth Assistant Medical Officer, unmarried. Salary £250 per annum, with quarters, board, attendance, washing, &c.

Manchester Ear Hospital, Grosvenor-square, All Saints.—Assistant Anæsthetist. Salary £15 15s. per annum.

Manchester, Hulme Dispensary, Dale-street, Stretford-road.—House Surgeon. Salary £180 per annum, with apartments, attendance, &c.

Manchester, Monsall Fever Hospital.—Fourth Medical Assistant. Salary £130 per annum, with board, lodging, and washing.

Manchester Northern Hospital for Women and Children, Park-place, Cheetham Hill-road.—House Surgeon. Salary £120 per annum, with apartments and board.

Manchester Royal Infirmary.—Medical Officer for Out-patients and Accidents to the Central Branch for six months. Salary at rate of £100 per annum, with board and residence.

Manchester, Township of South Manchester Hospitals, West Didsbury.—Junior Resident Medical Officer. Salary £120 per annum, with rations, apartments, and attendance.

Middlesbrough, North Ormesby Hospital.—Assistant House Surgeon. Salary at rate of £100 per annum first six months and £110 per annum afterwards, with board, apartments, washing, and attendance.

Middlesex County Council, Committee for the Care of the Mentally Defective.—Medical Officer. Salary £500 per annum.

National Hospital for Diseases of the Heart, Westmoreland-street, W.—Resident Medical Officer for six months. Salary at rate of £80 per annum, with board, residence, and washing.

Newark-upon-Trent Hospital.—Resident Medical Officer, unmarried. Salary £120 per annum, with board, lodging, and laundry.

Newcastle-upon-Tyne, University of Durham College of Medicine.—Demonstrator of Anatomy. Salary £200 per annum.

New Zealand, University of Otago.—Professor of Anatomy. Salary £800 per annum.

Norwich, Jenny Lind Hospital for Sick Children.—Female Resident Medical Officer for six months. Salary £50 per annum, with board, apartments, and laundry.

Nottingham, Bagthorpe Institution and Infirmary.—Assistant Resident Medical Officer, unmarried, for six months. Salary at rate of £165 per annum, with apartments, &c.

Nottingham General Hospital.—Assistant House Physician for six months. Salary at rate of £100 per annum, with board, residence, and laundry. Also Locum Tenens for 13 weeks. Salary £4 4s. per week, with board, residence, and laundry.

Notts County Council.—Assistant Tuberculosis Officer. Salary £300 per annum.

Paddington Green Children's Hospital, London, W.—House Surgeon for six months. Salary at rate of £80 per annum, with board, residence, and washing.

Paddington Infirmary and Workhouse.—Second Assistant Medical Officer. Salary at rate of £140 per annum, with board, lodging, and washing.

Plaistow Fever Hospital, London, E.—Second Assistant Medi Officer, unmarried. Salary £100 per annum, with rooms and found.

Portsmouth Workhouse Infirmary, Workhouse, and Childre Home.—Second Assistant Resident Medical Officer, unmarrie Salary £140 per annum, with apartments, rations, &c.

Preston, County Asylum, Whittingham, Lancs.—Junior Assista Medical Officer, unmarried. Salary £250 per annum, with boar apartments, &c.

Queen's Hospital for Children, Hackney-road, Bethnal Green, —House Surgeon and House Physician for six months. Salary rate of £80 per annum each, with board, residence, and washing.

Rochdale Infirmary and Dispensary.—Junior House Surgeo unmarried. Salary £110 per annum, with board, residence, an laundry.

Rotherham Hospital.—Senior and Junior House Surgeons. Salarie £150 and £100 respectively, with board, lodging, and washing.

Royal Dental Hospital of London, Leicester-square.—Assistan Dental Surgeon.

Royal Hospital for Diseases of the Chest, City-road, E.C.— Medical Registrar. Salary 100 guineas per annum. Also Addi tional Medical Officer to X Ray Department. Salary 25 guineas pe annum.

St. Albans, Herts County Asylum, Hill End.—Second Assistan Medical Officer, unmarried. Salary £225 per annum, with board, lodging, and washing.

St. Mark's Hospital for Cancer, Fistula, and other Diseases of the Rectum, City-road, E.C.—House Surgeon. Salary £100 per annum, with board, lodging, and washing.

Salford Royal Hospital.—Junior House Surgeon and Casualty House Surgeon. Salary at rate of £80 per annum each, with board and residence. Also Honorary Physician and Honorary Assistant Surgeon.

Salford Union Infirmary.—Senior Assistant Medical Officer and Assistant Medical Officer, unmarried. Salaries £200 and £150 per annum respectively, with apartments, attendance, and rations.

Salisbury Infirmary.—Assistant House Surgeon, unmarried. Salary £75 per annum, with apartments, board, lodging, and washing.

Sheffield, Jessop Hospital for Women.—Assistant House Surgeon, unmarried. Salary £80 per annum, with board, residence, and laundry.

Sheffield Royal Infirmary.—Ophthalmic House Surgeon for six months. Salary £80 per annum, with board and residence.

Sheffield Union Hospital, Firvale.—Resident Assistant Medical Officer, unmarried. Salary £120 per annum, with apartments, rations, &c.

Shrewsbury, Salop Infirmary.—House Physician. Salary at rate of £90 per annum, with board and apartments.

Southport County Borough Education Committee.—Medical Gentleman to operate upon cases of Enlarged Tonsils and Adenoids occurring amongst Children attending the Elementary Schools in the Borough. Salary £1 1s. per case.

Southwark Union Infirmary, East Dulwich-grove, S.E.—Second Assistant Medical Officer and Third Assistant Medical Officer. Salary £170 and £160 per annum respectively, with board, lodging, and washing.

Sunderland Royal Infirmary.—Junior House Surgeon. Salary £100 per annum, with board, residence, and laundry.

Swansea General and Eye Hospital.—Two House Surgeons. Salary £125 per annum, with board, washing, and attendance.

University of London, King's College.—Demonstrator of Physiology. Salary £120 per annum.

West Ham and Eastern General Hospital.—Junior House Physician and Junior House Surgeon. Salary at rate of £75 per annum, with board, residence, and washing.

Western Ophthalmic Hospital, Marylebone-road, W.—Honorary Anæsthetist. Salary £25 per annum.

West London Hospital, Hammersmith-road, W.—Two Assistant Anæsthetists.

Westminster Hospital.—Assistant House Physician and Assistant House Surgeon. Board provided in each case.

Wigan, Royal Albert Edward Infirmary and Dispensary.—Senior House Surgeon. Salary £170 per annum, with board, apartments, and washing. Also Junior House Surgeon. Salary £150 per annum, with board, apartments, and washing.

Wolverhampton Education Committee.—Assistant School Medical Officer. Salary at rate of £300 per annum.

Wolverhampton and Midland Counties Eye Infirmary.—House Surgeon. Salary £120 per annum, with apartments, board, and laundry.

York Dispensary.—Resident Medical Officer, unmarried. Salary £140 per annum, with board, lodging, and attendance.

Births, Marriages, and Deaths.

BIRTHS.

Lathbury.—On May 11th, at Chipperfield, King's Langley, the wife of Captain E. B. Lathbury, R.A.M.C., of a daughter.

MARRIAGES.

Wroughton—Stuart.—On April 2nd, at Howick, Natal, John Henry Wroughton, M.R.C.S., L.R.C.P., to Ethel Susan, daughter of G. B. N. Stuart, late D.I., R.I.C., Kingstown, Dublin.

DEATHS.

Busteed.—On April 27th, at "Tregare," 37, Hawke-road, Upper Norwood, Brigade-Surgeon William John Busteed, M.D., late Indian Army, aged 78.

Thorburn.—On April 26th, at Canton, China, by accident, John Melland Thorburn, aged 25, eldest son of William Thorburn, F.R.C.S., of 2, St. Peter's-square, Manchester.

N.B.—A fee of 5s. is charged for the insertion of Notices of Births, Marriages, and Deaths.

Notes, Short Comments, and Answers to Correspondents.

THE ETHICS OF EXPERIMENT ON HUMAN BEINGS.

THE following advertisement appeared recently in a lay newspaper: "Young man, strong, offers himself to any doctor for experimental purposes." Such an offer opens up the question as to whether experiments can rightly be made under these conditions, and whether ethical justice would sanction for either party an agreement of this character. In the case of the volunteer subject the question arises as to what extent natural right may allow him to permit injury to be voluntarily inflicted upon him for any other purpose than his own personal benefit, or as an act of self-devotion to the immediate necessity of some other person, as, for instance, in the case of transfusion of blood. Self-experimentation within well-defined limits may under certain circumstances be legitimate, and, as is well known, several investigators have practised it with a specific end in view. Section of the superficial radial nerve at the wrist, for instance, has been done, and has, we suppose, added to the sum total of knowledge. More daring have been certain inoculations from which some experimenters have observed the effects on themselves and others, and some of these investigations have unfortunately been fatal. The risk undertaken in his own person, however, by a competent scientific investigator seeking the solution to some definitely formulated problem to which a chain of previous research has led up, or by one of those associated with him in his work, who is actuated not by personal gain but purely by a scientific enthusiasm and devotion to duty (as was the case of those who voluntarily allowed themselves to be bitten by infected mosquitoes to settle the question whether these insects were or were not the transmitters of the disease, and for which they refused all pecuniary reward), stands on a very different footing from a mere gambling risk for the sake of gain and presumably without any special scientific interest or enthusiasm. But besides the ethical question there is a practical one for the experimenter who should accept such an offer as that advertised. There are, we know, degrees of danger in personal experiments, and there are, no doubt, many observations which could be carried out with little or no risk to the individual. But to what extent would an ordinary jury support the experimenter if the "subject" chose to bring an action for alleged damage, which might be wholly independent of the original investigation? There remains even yet a vague mass of opinion which still regards with suspicion any person who is suggested as "practising upon" anybody. For long this sentiment, which after all has its basis in strong common-sense, militated against the hospitals; and there is little doubt that a jury would require strong proof of innocence on the part of the experimenter, even in the face of the supposed written agreement between the parties concerned. The distinction between *post hoc* and *propter hoc* would be difficult to establish convincingly. Common-sense would be against both parties, but whilst some sympathy might be shown to the scientist, this would possibly be counterbalanced by the feeling that he was taking advantage of a weaker brother, though such weakness were shown only by the nature of the undertaking he had made himself responsible for. The law is jealous of the sanctity of the person, the *corpus*, and it is questionable whether any responsible scientific investigator would be willing to enter into an agreement fraught with such possibilities.

THE EXCRETION OF PHENOL.

IN discussing a recent case of carbolic acid poisoning in the pages of the *Dublin Journal of Medical Science* for May, 1914, Dr. Walter G. Smith takes occasion to review the mode of excretion of this substance and the tests applicable for its recognition. Like other aromatic bodies it has a tendency to combine with the sulphate radicle and with glycuronic acid, and to be excreted in the urine in one or other combination. The salt resulting from the former affinity is potassium phenyl-sulphate, isomeric with a sulphocarbolate, and as the phenyl-sulphate salts of barium are soluble in water it follows that they give no precipitate with barium chloride; hence it has sometimes been erroneously stated that in carbolic acid poisoning the sulphates disappear from the urine. The phenyl-sulphates are less toxic than carbolic acid, and the sulphate radicle thus serves as a protective body. Hence the administration of soluble sulphates is indicated in cases of poisoning, and experiments on animals prove them to have remarkable antidotal power. A comparatively small proportion of the phenol is excreted in combination with glycuronic acid, the resulting salt having some reducing power, while minute amounts also appear as pyrocatechin and hydroquinone, the colour-changes characteristic of the urine in these cases of poisoning being due to the presence of these substances. Beside the familiar violet reaction with liquor ferri perchloridi, the three main tests for phenol are the formation of a white precipitate of tribromphenol on addition of bromine water (Landolt's test); a rose-red colour with Millon's reaction, common to many hydroxyl derivatives of benzene (Plugge's test); and a blue colour on warming with ammonium hydrate, and adding bromine water (Berthelot's test) due to formation of indophenol.

A CASE OF BEE-STING.

To the Editor of THE LANCET.

SIR,—I should be glad if some of your readers could give me some information on the following matter. A few days ago I was called to see a man who had been stung on the forearm just over one of the superficial veins by a bee. I saw him less than half an hour after he had been stung, and found him covered from head to foot with a scarlatiniform rash which he said itched intolerably. The patient described the irritation as being like "pins and needles being stuck into him." The site of the sting had already been treated with weak ammonia. The temperature was normal, pulse full and bounding, rate 90 per minute, the tongue very dry and of a brownish colour. The patient complained of great thirst. I gave him some weak lead lotion for external application and an alkaline mixture. Three hours later I saw him again. The irritation had almost entirely abated, the tongue was moister and cleaner, and the thirst much diminished. The rash had practically disappeared. The patient had vomited about an hour after I saw him first. The pulse was now 76. At 4 o'clock next morning he was feeling sufficiently well to ride round the motor cycle racecourse and spend the rest of the morning attending to his machine. I saw him about midday and he said he felt all right except that he "thought he had a high temperature." His temperature, however, was normal and he had no further symptoms. He is accustomed to handling bees, and has often been stung before. I should be glad to know what the cause of these sudden acute and transitory symptoms is. According to Quain's Dictionary, 1895 edition, symptoms of this sort are not uncommon but appear to last longer than in this case. No information is given as to the cause. Perhaps one of your readers who is a bee expert can give me some information.

I am, Sir, yours faithfully,
LAWRENCE PICK.

Ballaugh, Isle of Man, May 22nd, 1914.

APRIL AT HOME AND ABROAD.

A CORRESPONDENT in British Columbia sends us the following note on the weather conditions in Western Canada during last month: "Perhaps you will print this, although it may be too late for your monthly report of the weather at home and abroad, for the Empire is world-wide, and so are the interests and readers of THE LANCET. In British Columbia the April weather was anticyclonic. Kamloops, in the interior, had temperatures varying between 78° and 25° F. Vancouver, on the lower mainland, had an average temperature of 50°, 155 hours of bright sunshine, and 3·50 inches of rain. Victoria, at the south end of Vancouver Island, had an average temperature of 51° (varying between 64° and 35°), 178 hours of bright sunshine (no day totally clouded), and 1·04 inches of rain; so the month's weather here was pleasant."

THE DANGEROUS PISTOL.

T. H. Spencer, a boy employed as a van-guard, was tried at the Old Bailey recently for the manslaughter of a girl 15 years of age and acquitted of that charge. It was proved that in pulling a pistol out of his pocket in the street he discharged it, killing the child, who at the time was walking away from him. In these circumstances it was hardly to be expected that the lad would be convicted of felony, but the case should serve as a warning to others like him, and should impress on the public mind the dangerous nature of toys of this class. The weapon was one not subject to the Pistols Act, and so could be sold without the formalities required by that not over stringent statute. The evasion practised by traders in this instance is a simple one, and may indeed be said to be invited by a definition of a "pistol," which limits it for the purposes of the Act to one with a barrel 9 inches in length. Anyone who recalls the weapon once more or less familiar to schoolboys as a "saloon pistol" will realise that an extra [illegible] inch in the barrel does not make such a firearm materially less easy for a boy to carry or conceal, and leaves it, as Mr. Justice Rowlatt defined it, a "confoundedly deadly weapon." It has been stated that the Home Secretary contemplates introducing legislation upon the subject of pistols, and it is to hoped that any new Act upon the subject will restrict and regulate the carrying or possessing of any such weapons without regard to the interests of traders or manufacturers.

CARBOLIC ACID INJECTIONS IN TETANUS.

To the Editor of THE LANCET.

SIR,—In the interesting description of a case of tetanus treated with injections of carbolic acid published in your last issue, Mr. Graham Reynolds omitted to state at what intervals the injections were given. I should be very grateful if he would supply this information, as it appears to me a treatment well worth a trial.

I am, Sir, yours faithfully,

Shoreham, Sussex, May 27th, 1914. F. CARDEN BRODIE.

◆

R. B.—Our correspondent inquires "Whether, and if so on what ground, an Approved Society can refuse to pay sickness benefit to a member incapacitated from earning his living by an accident having no connexion with his work?" In two instances cited by our correspondent workmen have been refused sickness benefit after being injured by motor-cars when out at night for their own purposes. Presumably in these cases the benefit has been refused by the societies in accordance with Section II. of the Act, because the societies believe that the men are entitled to damages at common law from the persons responsible for their injuries, and that they are unreasonably neglecting to take proceedings to enforce their claims. Our correspondent is referred to the section mentioned.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

Medical Diary for the ensuing Week.

SOCIETIES.

NORTH-EAST LONDON CLINICAL SOCIETY, Prince of Wales's Hospital, Tottenham, N.

THURSDAY.—4.15 P.M., *Election of Officers for 1914–15.* Clinical Meeting.

WEST LONDON MEDICO-CHIRURGICAL SOCIETY, West London Hospital, Hammersmith-road, W.

FRIDAY.—8 P.M., Members are *invited to show Cases.* 8.30 P.M., Paper:—Dr. J. F. H. Dally: Electro-Cardiography and its Clinical Application (illustrated).

LECTURES, ADDRESSES, DEMONSTRATIONS, &c.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC, 22, Chenies-street, W.C.

TUESDAY.—4 P.M., Dr. G. A. Sutherland: Clinique (Medical). 5.15 P.M., Lecture:—Dr. C. O. Hawthorne: Some Visual Fields in Intra-cranial Disease.

WEDNESDAY.—4 P.M., Mr. J. M. G. Swainso : Clinique (Surgical). 5.15 P.M., Lecture:—Dr. W. Hill: Prevalent Misconceptions Concerning the Œsophagus *in Health and Disease.*

THURSDAY.—4 P.M., Mr. A. H. Todd: Clinique (Surgical). 5.15 P.M., Lecture:—Mr. A. McNab: Recent Advances in the Treatment of Glaucoma.

FRIDAY.—4 P.M., Mr. G. H. Whale: Clinique (Ear, Nose, and Throat).

POST-GRADUATE COLLEGE, West London Hospital, Hammersmith-road, W.

TUESDAY.—10 A.M., Dr. Robinson: Gynæcological Operations. Dr. Owen: Demonstration of Cases in Wards. 12 noon, Mr. T. Gray: Demonstration of Fractures, &c. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Baldwin: Operations. Dr. Davis: Diseases of the Throat, Nose, and Ear. Dr. Pernet: Diseases of the Skin. 5 P.M., Lecture:—Mr. B. Harman: Concomitant Squint.

WEDNESDAY.—10 A.M., Dr. Saunders: Diseases of Children. Dr. Davis: Operations of the Throat, Nose, and Ear. 11 A.M., Mr. Souttar: *Demonstration of Minor Operations.* 12 noon, Lecture:—Mr. Souttar: Abdominal Diagnosis. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Pardoe: Operations. Dr. Simson: Diseases of Women and Diseases of the Eye. 5 P.M., *Lecture*:—Mr. B. Harman: Paralytic Squint.

THURSDAY.—9 A.M., Dr. Bernstein: Bacterial Therapy Department. 10 A.M., Dr. Simson: Gynæcological Demonstration. 12 noon, Lecture:—Dr. G. Stewart: Neurological Cases. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. D. Armour: Operations. Mr. B. Harman: *Diseases of the Eye.* 5 P.M., Lecture:—Mr. B. Harman: Congenital Cataract.

FRIDAY.—10 A.M., Dr. Robinson: Gynæcological Operations. 10.30 A.M., Surgical Registrar: Demonstration of Cases in Wards. 12.15 P.M., Lecture:—*Dr.* Bernstein: Applied Pathology. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Baldwin: Operations. Dr. Davis: Diseases of the Throat, Nose, and Ear. Dr. Pernet: Diseases of the Skin. 5 P.M., Lecture:—Mr. B. Harman: Senile Cataract.

SATURDAY.—10 A.M., Dr. Saunders: *Diseases of Children. Dr. Davis*: Operations of the Throat, Nose, and Ear. Mr. B. Harman: Diseases of the Eye. 12 noon, Lecture:—Mr. Souttar: Surgical Anatomy of the Abdomen. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Pardoe: Operations.

LONDON SCHOOL OF CLINICAL MEDICINE, Dreadnought *Hospital, Greenwich.*

TUESDAY.—Out-patient Demonstrations:—10 A.M., Dr. C. E. Zundel: Medical. Mr. Cole: Surgical. 12 noon, Dr. H. MacCormac: Skin.——2 P.M., Mr. L. McGavin: Operations. 2.15 P.M., Mr. R. Carling: Surgery. 3.15 P.M., Dr. G. Rankin: Medicine. 4.15 P.M., Sir Malcolm Morris: Skin.

WEDNESDAY.—Out-patient Demonstrations: 10 A.M., Dr. H. R. Carlill: Medical. Mr. Cecil Rowntree: Surgical. 11 A.M., Mr. R. E. Bickerton: Eye.——2 P.M., Mr. L. V. Cargill *or Mr. Choyce*: Operations. 2.15 P.M., Dr. F. Taylor: Medicine. 3.15 P.M., Mr. Cargill: Eye Clinique. 4.30 P.M., Mr. C. C. Choyce: Surgery. 4.30 P.M., Special Lecture:—Mr. C. C. Choyce: Some Tumours of Bone.

THURSDAY.—Out-patient Demonstrations:—10 A.M., Dr. H. R. Prentice: Medical. Mr. H. Curtis: Surgical. 12 noon, Mr. G. N. Biggs: Throat, Nose, and Ear.——2 P.M., Mr. R. Carling or Mr. W. Turner: Operations. Dr. A. Davies: Pathological Demonstration. 3.15 P.M., Dr. R. Wells: Medicine. 4.30 P.M., Special Lecture:—Prof. R. T. Hewlett: Infective Endocarditis, its Causation and Results.

FRIDAY.—Out-patient Demonstrations:—10 A.M., Dr. C. E. Zundel: Medical. Mr. Cole: *Surgical. 12 noon, Dr. H. MacCormac*: Skin.——2 P.M., Mr. L. McGavin: Operations. 2.15 P.M., Sir John Rose Bradford: Medicine. 3.15 P.M., Mr. L. McGavin: Surgery.

SATURDAY.—Out-patient Demonstrations: 10 A.M., Dr. H. R. Prentice: Medical. Mr. Cecil Rowntree: Surgical. 11 A.M., Mr. R. E. Bickerton: Eye.——10 A.M., Col. Barry: Radiography.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.

MONDAY.—*Clinics:—10.30* A.M., *Surgical Out-patient* (Mr. E. Gillespie). 2.30 P.M., Medical Out-patient (Dr. T. R. Whipham); Gynæcological (Dr. Banister). 3 P.M., Medical In-patients (Dr. R. M. Leslie).

TUESDAY.—2.30 P.M., Operations. Clinics:—Medical Out-patient (Dr. A. G. Auld); Surgical (Mr. Howell Evans); Nose, Throat, and Ear (Mr. H. D. Gillies). X Ray and Electrical Methods (Dr. Metcalfe). 3.30 P.M., Medical In-patient (Dr. A. J. Whiting).

WEDNESDAY.—Clinics:—2 P.M., Throat Operations (Mr. Gillies). 2.30 P.M., Children's Out-patient (Dr. T. R. Whipham); Skin (Dr. G. N. Meachen); Eye (Mr. Dorell).

THURSDAY.—2.30 P.M., Gynæcological Operations *(Dr. A. E. Giles). Clinics*:- *Medical Out-patient (Dr. A. J. Whiting)*; Surgical (Mr. Carson); X Rays and Electrical Methods *(Dr. Metcalfe).*

FRIDAY.—2.30 P.M., Operations. Clinics:—Medical Out-patient (Dr. A. G. Auld): Surgical (Mr. E. Gillespie); Eye (Mr. R. P. Brooks). 3 P.M., Medical In-patient (Dr. G. P. Chappel).

ROYAL HOSPITAL FOR DISEASES *OF* THE CHEST, Medical School, City-road, E.C.

MONDAY.—1.30 P.M., Department for the Prevention of Consumption. 2 P.M., Cardiac Department, *Dr. Stott; Out-patient* Department, Dr. Phear, Dr. S. Thompson. 3 P.M., Wards, Dr. Phear.

TUESDAY.—9 A.M., Laryngological Department, Mr. Mant. 1.30 P.M., *Department for the Prevention* of Consumption. 2 P.M., Out-patient Department, Dr. M. Leslie, Dr. B. King; *Operations,* Mr. A. Evans. 3 P.M., Wards, Dr. White. 4 P.M., Wards, Dr. M. Leslie

WEDNESDAY.—2 P.M, Wards, Dr. A. Davies; *Out-patient* Department, Dr. Drysdale, Dr. Kellie. 4 P.M., Wards, Dr. Drysdale. 4.30 P.M., Roentgen Ray Department, Dr. Jordan.

THURSDAY.—9.30 A.M., Dental Department, Mr. G. Thomson. 10 A.M., Cardiac Department, Dr. Stott. 1.30 P.M., Department for the *Prevention of Consumption.* 2 P.M., Out-patient Department, Dr. Phear, Dr. S. Thompson. 4.30 P.M. Laryngological Department, Mr. Mant.

FRIDAY.—1.30 P.M., Department for the Prevention *of* Consumption. 2 P.M., Wards, *Dr. Calvert;* Out-patient Department, Dr. M. Leslie, Dr. B. King. 5 P.M., *Lecture-Demonstration*:—Mr. Mant: The Larynx in Relation to Tuberculosis.

SATURDAY.—10 A.M., Out-patient Department, Dr. Drysdale, Dr. Kellie. 11.30 A.M., Roentgen Ray Department, Dr. Jordan.

LONDON HOSPITAL MEDICAL COLLEGE (UNIVERSITY *OF* LONDON), Clinical Theatre, London Hospital, Mile End-road, E.

Course of Lectures on Tuberculosis for *Post-Graduates* and *Senior Students*:—

TUESDAY.—4 P.M., Dr. H. L. Tidy: *Relation of Tuberculosis to* Other Conditions, including Pregnancy.

WEDNESDAY.—2 P.M., Dr. W. J. Hadley: *Diagnosis.* 4 P.M., Dr. P. Kidd: Prognosis.

THURSDAY.—11 A.M., Dr. J. H. *Sequeira*: Cutaneous Tuberculosis. 4 P.M., Dr. F. J. Smith: Medico-Legal Aspects.

FRIDAY.—2 P.M., Dr. W. J. Hadley: Pleurisy. 4 P.M., Dr. C. Wall: Environment.

GUY'S HOSPITAL MEDICAL *SCHOOL*, London Bridge, S.E.

Course of Lectures on Industrial Medicine:—

FRIDAY.—Lecture V.:—Dr. F. Shufflebotham: Anthrax.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton, S.W.

WEDNESDAY.—4.30 P.M., Lecture:—Dr. Inman: The Technique of the Complement-fixation Test Applied to Tuberculosis.

CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, Victoria Park, E.

Course of Demonstrations for Post-Graduates:—

FRIDAY.—4 P.M., Dr. G. Lyon: Demonstration *of Cases under Treatment.*

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen-square, Bloomsbury, W.C.

TUESDAY.—3.30 P.M., Clinical Lecture:—Dr. K. Wilson: Tics.

FRIDAY.—3.30 P.M., *Clinical Lecture*:—Dr. K. Wilson: Torticollis.

THE THROAT HOSPITAL, Golden-square, W.

MONDAY.—5.15 P.M., Special *Demonstration of Selected Case.*

THURSDAY.—5.15 P.M., Clinical Lecture.

NDON LOCK HOSPITAL, 91, Dean-street, Soho, W.

pecial Course of Instruction in Venereal Diseases, for Post-Graduates and Students, with Practical Demonstrations of the Various Methods of Treatment:—

MONDAY.—Clinics:—1 P.M., Mr. Ryall; 6 P.M., Mr. Gibbs.

TUESDAY.—Clinics:—2 P.M., Mr. Lane; 6 P.M., Mr. Paterson.

WEDNESDAY.—Clinic:—6 P.M., Mr. Shillitoe. 5 P.M., Lecture:— Dr. Phillips: Visceral Syphilis.

SATURDAY.—Clinic:—2 P.M., Mr. McDonagh.

YAL INSTITUTION OF GREAT BRITAIN, Albemarle-street, iccadilly, W.

FRIDAY.—9 P.M., Prof. W. H. Bragg: X Rays and Crystalline Structure.

or further particulars of the above Lectures, &c., see Advertisement Pages.

A DIARY OF CONGRESSES.

e following Congresses, Conferences, and Exhibitions are announced.

n 1914:—

May 1st–Nov. 1st (Lyons).—International Town Hygiene Exhibition.

,, 15th–Oct. 15th (Berne).—Swiss National Exhibition.

May–October (London, Shepherd's Bush).—Anglo-American Exposition.

June 1st–5th (Berlin).—Third Congress of the International Urological Society.

,, 8th–10th (Berne).—Seventh International Dairy Congress.

,, 9th–12th (Birmingham).—National Council of Nurses' Annual Conference and Nursing Exhibition.

,, 15th–18th (Portsmouth).—International Abolitionist Conference (Prostitution).

,, 18th–20th (Newcastle-upon-Tyne).—Fifth Annual Conference of the British Hospitals Association.

,, 18th–24th (London, Church House, Westminster).—International Conference on the Blind.

June–July (Groningen).—University of Groningen 300th Anniversary Celebration.

July 2nd and 3rd (Liverpool).—National Conference on Infant Mortality.

,, 6th–11th (Blackpool).—Twenty-ninth Congress of the Royal Sanitary Institute.

,, 7th–10th (St. John, N.B.).—Canadian Medical Association.

,, 8th–10th (Oxford).—Ophthalmological Congress.

,, 15th–20th (Edinburgh).—Congress of the Royal Institute of Public Health.

,, 21st–23rd (Chester).—British Pharmaceutical Conference.

,, 27th–31st (London).—Fifth Annual Session of the Clinical Congress of Surgeons of North America.

,, 28th–31st (Aberdeen).—Eighty-second Annual Meeting of the British Medical Association.

Aug. 3rd–8th (London).—Sixth International Dental Congress.

,, 10th–15th (St. Petersburg).—Twelfth International Congress of Ophthalmology.

Sept. 7th–12th (Berne).—International Congress for Neurology, Psychiatry, and Psychology.

,, 10th–12th (Fort William and Port Arthur, Ontario).—Fourth Annual Congress of the Canadian Public Health Association.

,, 21st–26th (Victoria, B.C.).—Dominion Exhibition.

,, 21st–26th (Vienna).—Third International Congress on Diseases of Occupation.

,, 30th–Oct. 4th (Brussels). Fourteenth French (de langue française) Congress of Medicine.

Oct. 31st–Nov. 2nd (Berlin).—First Congress of the International Society for Sexual Research.

Nov. 15th–21st (London).—Health Week. (Under the direction of the Health Week Committee appointed by the Royal Sanitary Institute.)

(St. Petersburg).—Third Mendeléeff Congress of Pure and Applied Chemistry and Physics.

n 1915:—

May 31st–June 5th (London, South Kensington).—Sixth International Congress of Social Work and Service.

Sept. 8th (begins) (Manchester).—Meeting of the British Association.

EDITORIAL NOTICES.

IT is most important that communications relating to the itorial business of THE LANCET should be addressed *lusively* "TO THE EDITOR," and not in any case to any itleman who may be supposed to be connected with the itorial staff. It is urgently necessary that attention should given to this notice.

is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this office.

tures, original articles, and reports should be written on one side of the paper only, AND WHEN ACCOMPANIED BY BLOCKS IT IS REQUESTED THAT THE NAME OF THE AUTHOR, AND IF POSSIBLE OF THE ARTICLE, SHOULD BE WRITTEN ON THE BLOCKS TO FACILITATE IDENTIFICATION.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers—not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale, and advertising departments of THE LANCET *should be addressed "To the Manager."*

We cannot undertake to return MSS. not used.

MANAGER'S NOTICES.

TO SUBSCRIBERS.

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423, Strand, London, W.C., are dealt with by them? Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and *not* to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will ensure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

THE COLONIAL AND FOREIGN EDITION (printed on thin paper) is published in time to catch the weekly Friday mails to all parts of the world.

The rates of subscriptions, post free from THE LANCET Offices, have been reduced, and are now as follows:—

FOR THE UNITED KINGDOM.				TO THE COLONIES AND ABROAD.			
One Year	£1	1	0	One Year	£1	5	0
Six Months	0	12	6	Six Months	0	14	0
Three Months	0	6	6	Three Months	0	7	0

(The rate for the United Kingdom will apply also to Medical Subordinates in India whose rates of pay, including allowances, is less than Rs.50 per month.)

Subscriptions (which may commence at any time) are payable in advance. Cheques and Post Office Orders (crossed "London County and Westminster Bank, Covent Garden Branch") should be made payable to the Manager, Mr. CHARLES GOOD, THE LANCET Offices, 423, Strand, London, W.C.

TO COLONIAL AND FOREIGN SUBSCRIBERS.

SUBSCRIBERS ABROAD ARE PARTICULARLY REQUESTED TO NOTE THE RATES OF SUBSCRIPTIONS GIVEN ABOVE.

The Manager will be pleased to forward copies direct from the Offices to places abroad at the above rates, whatever be the weight of any of the copies so supplied.

SOLE AGENTS FOR AMERICA—MESSRS. WILLIAM WOOD AND CO., 51, Fifth Avenue, New York, U.S.A.

The Oliver-Sharpey Lectures

ON

SOME EFFECTS WHICH FOLLOW UPON CHANGES IN THE REACTION OF THE BLOOD.

Delivered before the Royal College of Physicians of London on March 31st and April 2nd, 1914,

BY F. GOWLAND HOPKINS, M.A. CANTAB., M.B., D.Sc. LOND., F.R.C.P. LOND., F.R.S.,

READER IN CHEMICAL PHYSIOLOGY IN THE UNIVERSITY OF CAMBRIDGE.

LECTURE I.

Delivered on March 31st.

MR. PRESIDENT AND GENTLEMEN,—I wish first to express my thanks to the College for entrusting these lectures to me. No worker in any branch of physiology could fail to find satisfaction in having his name associated, however temporarily, with those names which give a title to the lectures. Several of my predecessors have been able to claim personal knowledge of Dr. William Sharpey. The privilege of making this claim is not mine, and it is likely to belong to very few of my successors. Personal memories of one who died 34 years ago when nearly an octogenarian cannot now be in the possession of very many. But to-day we are all yet in touch with the great traditions of the physiological school of University College, London, as it existed during the middle third of the last century. A later generation, however, may perhaps need more reminder of the name of William Sharpey, for his reputation is due to great personal qualities rather than to a prolific pen. We may rejoice, therefore, that the piety of his friends has linked his name with commemorative lectures and a scholarship.

Only those who have read the gossip of the time will realise what courage Sharpey needed when he began his work in Gower-street. He came from Edinburgh knowing full well that his London appointment had been bitterly opposed in influential circles, and that he had to overcome strong prejudices. His crimes were only those of being comparatively young and of lacking the personal acquaintance of certain great people in London medical circles. THE LANCET, which voiced the opposition, spoke of him as the "unknown man from the North." But, like many another man from the north, he came south provided, not only with courage, but with such qualifications as make success certain. Those who opposed his appointment while he was unknown ranked themselves amongst his admirers when he had displayed his qualities. Knowing the circumstances it is very interesting to read his first introductory lecture to the students of University College delivered on Monday, Oct. 3rd, 1836. It was full, first of all, of what may be termed scientific commonsense; but it sounded the keynote of a method of teaching which, if cautious, could never be other than inspiring. The lecturer at this time professed, you will remember, anatomy and physiology conjointly. Dealing with the former subject he voiced a remarkably modern view concerning the bearings of comparative anatomy, the significance of vestigial relics, and the like. His mind was clearly even then prepared for the acceptance of evolutionary doctrine. An eloquent passage which closed his address to the London meeting of the British Medical Association 26 years later—in 1862—showed that, in spite of characteristic caution he greatly welcomed the opportunity for intellectual expansion which Darwin had by then provided. When, in his first London lecture, he turned to the subject of physiology he claimed that its foundations lay in anatomy and especially in histology. But he was no apostle of mere descriptive methods. He was all for experiment, and urged of physiology that "the great aim of the science is to arrive at the general laws to which individual phenomena are subordinate."

ANALYSIS OF THE BLOOD.

A general end to which many individual phenomena in the body seem subordinate is the maintenance of a normal mean in the composition of the blood. While we have long realised that the essential dynamic changes of metabolism occur within the tissue cell we have come, during the past ten years, to appreciate more fully than ever how important to the cell are the minutest details in the composition of the fluids which bathe it. We have arrived, too, at a better understanding of the extraordinary nice adjustment of the properties of the blood to its functions as a medium of transport.

Our ability to study equilibrium in the blood has increased very greatly during the past few years by the introduction of micro-analytical methods of research. We may now add to our quantitative studies of the morphological elements, and of the subtle bodies concerned in immunity phenomena, accurate determinations of the blood gases. We may also estimate a considerable number of ordinary metabolites as they circulate, even when we are limited to such amounts of blood as may be obtained by pricking the finger. These methods have already yielded some most pregnant facts, and their availability, together with the certainty that similar methods will be found for still other blood constituents, is opening up new ground for research.

Reference to methods of analysis calling for minute quantities of blood seems especially justifiable in these lectures because they so extend our power of making "observations and experiments on man himself." But if the claim be made that determinations can be carried out on blood obtained from a finger prick we most assuredly cannot ignore the important work of the distinguished founder of these lectures—work which formed the subject-matter of the first lecture of the series. It will, of course, be remembered that Dr. Oliver was able to follow the actual variations in lymph flow which are the result of digestion, exercise, &c., by determining the corresponding variations in the cellular elements, and in the specific gravity, of the blood obtained from the finger before and after compression. These researches show that no accuracy can be hoped for in determinations of the non-diffusible elements in the blood as obtained from the finger unless the variations of lymph flow are properly allowed for. But it does not quite follow that the criticism applies when diffusible constituents are in question. The point seemed easy to test by estimating sugar and chlorides by the very accurate processes described by Ivar Bang, comparing these constituents in the blood obtained respectively before and after compression of the finger by Dr. Oliver's method. My colleague, Mr. S. W. Cole, who has attained to great skill in the use of the above micro-analytical methods, kindly undertook to investigate the point. As the result of a large number of estimations upon three individuals he was unable to find any measurable difference in the chlorides. Equilibrium between blood and lymph is, in respect of the chlorides, apparently too complete for any differences to appear. In connexion with sugar the results were somewhat different. As a rule the figures obtained before and after compression of the finger agreed closely, but in certain cases there was a marked difference. The variations could not be very closely related to the taking of food or exercise, but the highest differences observed occurred when the samples were taken above two hours after a full meal. The results seem to indicate that it is well in all cases when it is proposed to make estimations upon blood from the finger to preserve standard conditions in connexion with the withdrawal.

THE CHEMICAL REACTION OF THE BLOOD.

But I am specially concerned with one particular quality of the blood—namely, its chemical reaction. Variations in this can now be studied with great accuracy by the use of the very small amounts of blood we have been considering. It is an old subject of study which has entered upon a new phase; new because accuracy of method is now available in connexion with it; but also because the progress of physical chemistry has now given definiteness to what was previously a somewhat vague conception. We were long content to speak of the blood as an alkaline fluid because it turns red litmus blue or affects certain other coloured indicators in a particular sense. We were content to determine the degree of alkalinity by observing how much standard acid must be added before this or that indicator ceased to be affected. That the information so obtained is indefinite becomes at once clear from the fact that the end-point is different with different indicators. We needed a clearer definition of the terms "neutrality," "alkalinity," and "acidity," and a measure of "reaction" which is independent of such variable factors. To-day we can both define and measure "chemical reaction" satisfactorily in terms of the hydrogen ion concentration.

The qualities which all acid solutions have in common—qualities from which our fundamental conception of "acidity" emerges—are due to the existence of free hydrogen (H) ions in the solution; similarly, the qualities which are common to all bases, and from which we get our general idea of "alkalinity," are due to the existence of hydroxyl (OH) ions in solution. A determination of the concentration of one or other of these ions yields an absolute measure of the potency of a solution to produce those particular chemical effects which are correlated with acidity or alkalinity. This is by no means necessarily true of a determination by titration. Two solutions may have been proved in other ways to be, say, of equal alkalinity, yet one may call for the addition of much more acid than the other before neutrality is established.

Determination of Hydrogen Ion Concentration.

The concentration of H or OH ions in blood can now be measured with considerable accuracy and with conveniently small quantities of material. The direct determination is more easy in the case of the H ion, but fortunately this determination by itself gives simultaneously an indirect measure of the OH ion concentration. In neutral solutions the two kinds of ion are present in exactly equal concentration, and the following equation holds for all aqueous solutions:

$$C_H \times C_{OH} = \text{Constant} = 10^{-14{\cdot}14};$$

that is to say, the product of the concentrations of H and OH ions is always constant and is equal to the dissociation constant of pure water. If, therefore, we determine either concentration we can, since the constant is known, always calculate the other. It has, indeed, proved convenient to express the reaction of any solution, be it acid or alkaline, in terms of the hydrogen ion concentration, a course which the relations just referred to clearly make possible. The value is stated with reference to the "normal" hydrogen solution (1 gramme per litre). We have usually to do with concentrations which are but a small fraction of this, and at Sörensen's suggestion it is now customary to state them in the form of the common logarithm, which expresses their normality value, the minus sign of the logarithm being omitted. Expressed in this way the hydrogen ion concentration (P_H) of decinormal hydrochloric acid becomes 1·04, that of a neutral solution 7·07, and that of a decinormal sodium hydrate solution 13·06. If these three figures be borne in mind they form, as it were, a scale to which we can refer other values. One soon becomes accustomed to this newer method of expressing quantitatively the chemical reaction of fluids. The chief thing to bear in mind is that an increase in these negative exponential values means decrease in acidity, or, when the value of 7·07 is passed, increase in alkalinity.

The fundamental method of determining the hydrogen ion concentration in a fluid is that of measuring the potential set up when a hydrogen electrode is in contact with the fluid which is being studied. Another efficient and interesting method will be mentioned later. It is impossible for me to discuss the details of the first-mentioned method; I would only point out that in the case of blood it is only quite recently that the technique has been developed to the point of accuracy. It is essential before we can know the real condition of the circulating blood that estimation should be made upon samples exposed to a normal tension of carbonic acid, since this, of course, is an important factor in determining the existing reaction. Owing to the work of Hasselbalch such estimations can now be carried out with ease, but I think the last word has not been said in connexion with possible improvements.

Titration and the "Buffer" Action of Salts.

The many determinations that have now been made point to the fact that the hydrogen ion exponent (P_H) of blood is of the order of 7·36—that is to say, the reaction of the blood is very slight indeed upon the alkaline side of neutrality. Yet when blood is titrated it requires so much acid to neutralise it that we should be led to speak of a decided alkalinity. Titrated, for instance, with standard sulphuric acid and with the use of lackmoid as an indicator, the whole blood shows a neutralising power equal to that of a solution containing 370–400 milligrammes[1] of sodium hydrate per 100 c.c., which is nearly equal to that of a decinormal solution of soda. The blood certainly does not behave as though it possessed such an alkalinity. An approximate understanding of this apparent paradox is no new thing. It has, of course, been long understood that it is the presence in particular of carbonates and phosphates which explains it; but it remained for the development of physical chemistry to give a clearer explanation and to demonstrate exactly why the blood while a nearly neutral fluid is one to which considerable quantities of acid or base may be added without appreciable change in its reaction. The work of Höber, and especially that of Lawrence J. Henderson,[2] has been largely instrumental in making the matter clear to biologists. The fact that the effective reaction of a fluid depends upon the concentration of H and OH ions lies at the bottom of the explanation, as well as the circumstance that weak bases and weak acids such as carbonic acid and phosphoric acid exhibit a very low degree of ionisation. If we add acid in successive quantities to water or to a solution of stable salt such as sodium chloride, the acidity rises, of course, nearly in proportion to the acid added; but a solution of such salts as phosphates, acidates, borates, &c., or one containing such substances as aminoacids, though neutral to start with, will change in acidity only slowly as extraneous acid is added. Such substances are known as "buffers," their presence stableises a solution in respect of changes in hydrogen ion concentration. The following figures from a paper by Hasselbalch and Lundsgaard show the effect of phosphates in preventing a rise of acidity with increasing tensions of carbonic acid.

---

[1] Landau: Archiv für Experimentelle Pathologie und Pharmakologie, lii., 271 (1905). Rzentkowski: ibid., lv., 47 (1906)

Solution.	C_H at— 0 mm. CO_2.	50 mm. CO_2.	Percentage rise in C_H.
N/10 KCl.	$2·04 \times 10^{-7}$	$15·20 \times 10^{-7}$	791
Na_2HPO_4 + NaH_2PO_4	$1·78 \times 10^{-7}$	$2·45 \times 10^{-7}$	33

It is seen that a rise of 50 mm. in the tension of carbonic acid increases the hydrogen ion concentration in a potassium chloride solution by 791 per cent., whereas in a solution of equal parts of monopotassium and dipotassium phosphates the rise is only 38 per cent. These buffer salts stableise against change on either side of the neutral point; thus Henderson points out that in the case of a simple solution of $NaHCO_3$, NaH_2PO_4, and Na_2HPO_4 subjected to a constant tension of carbonic acid, there is such stability in respect of hydrogen ions that, in order to change its reaction from one of 0·0000002 normal acid to one of 0·0000002 normal alkali, it is necessary to add a decinormal solution of NaHO in amount nearly equal to the volume of the solution. The stability of blood in this respect is still greater than that of a solution of its salts; its proteins also act as buffers, since they form compounds of low ionising power with both acids and bases.

Now, titration with indicators which change colour when a known hydrogen ion concentration is reached gives an empirical measure of the range of this buffer action, and I wish to emphasise the point that we thus measure an important independent variable in the blood. Titration values are by no means without significance. We may use in illustration of this an analogy derived from electrical phenomena. Actual acidity may be taken as corresponding with electrical potential; the neutralising power of a solution due to the buffer action of its salts will then correspond with the capacity of, say, a condenser. To raise two uncharged condensers to the same potential requires quantities of electricity which are proportional to their capacity; to raise two neutral solutions to the same acidity will require quantities of acid which are proportional to their buffer action. To produce any given change in potential more electricity is required in the case of the condenser of greater capacity, and to produce a given change in hydrogen ion concentration more acid is required in the case of the solution with the more efficient buffers. The existing potential is, of course, no measure of the capacity. Blood corpuscles, for instance, show a distinctly higher hydrogen ion concentration, an appreciably greater effective acidity than the plasma, yet on titration they are found to neutralise much more acid than the plasma can. They would, but for the above considerations, be called more alkaline. Their acid potential is higher than that of the plasma, but so also is their acid capacity. It is clear that we want information as to both these variables in the case of any sample of the whole blood; one sample, while displaying the same actual acidity as that of another, may be nearer the limits of its power to take up more acid.

RESPIRATORY MECHANISMS AND BLOOD REACTION.

We need not look far for proof of the physiological importance of the factors which enable the blood to maintain nice adjustment in its chemical reaction, in spite of the wide fluctuations in acid production which occur in metabolism. The extraordinary sensitiveness of the respiratory centre to any change in the reaction arrests us. In 1905 Haldane and Priestley advanced the simple and fruitful view, based upon enlightened experimental work, that under normal circumstances the tension of carbonic acid in the blood is the sole factor which regulates the activity of the centre, and so determines the rate of ventilation through the lungs. Subsequent investigations by Haldane and his colleagues, and by Winterstein, Hasselbalch, and others have led to the generally accepted conclusion that carbonic acid exercises its action, not as a specific hormone, but in virtue of its acidity, and that other acids have a similar action. It is changes in the hydrogen ion concentration of the blood that determine changes in the activity of the centre. Its sensitiveness to such changes is truly extraordinary. The Oxford studies of lung ventilation, as it is related to alveolar CO_2 tension, coupled with Hasselbalch's studies of the blood, have led Dr. Haldane to claim that the activity of the centre is increased by 50 per cent. as the result of an increase of $0·005 \times 10^{-7}$ in the hydrogen ion concentration of the circulation. This would mean an increase of acidity about equal to that produced by adding two millionths of a milligramme of hydrochloric acid to 100 c.c. of water—a quantity outside the range of physical measurement. A swing of like order towards the alkaline side will produce apnœa. Imagine what fine adjustments in the blood must occur during the wide fluctuations of metabolism to prevent the constant occurrence of dyspnœa or apnœa. Haldane has bidden us take note of this marvellous display of teleological adjustment as a warning against mechanistic views concerning the animal. It would seem, indeed, that there can be no conditions involving measurable change in the chemical reaction of the blood; except in association with extreme dyspnœa even infinitesimal variations would seem to be incompatible with life.

The subject suggested by the title of my lectures would then appear to have a very limited range. But it is not impossible, to judge from some work of the Copenhagen School, that Dr. Haldane has somewhat exaggerated the delicacy of our respiratory centres. Krogh and Lindhard[3] find, for instance, that the Oxford physiologists have in certain cases over-estimated carbonic acid in the alveolar area.

---

[2] Ergebnisse der Physiologie, 1909.

[3] Journal of Physiology, vol. xlvii., p. 431 (1914).

This would lead them also to over-estimate the increase in lung ventilation produced by a given increase of acidity in the blood. It is only fair to say that Dr. Haldane has not yet had the opportunity of replying to this criticism. Granting it has no weight, there is another variable to consider, one which has always been emphasised by the Danish workers. If the sensitiveness of the respiratory centre varies, then the reaction of the blood may also vary without producing proportionate dyspnœa. Haldane and his colleagues seem indisposed to admit that the centre can undergo changes of excitability, but apart from the positive evidence in favour of a variability, it would seem extraordinary if the nerve cells of the centre were wholly immune from inherent change. If, as the result of disease, or for other reasons, a change in the normal hydrogen ion concentration of the blood were gradually established, one might expect that the centre would adjust to it. An alteration in the sensitiveness of the centre might thus be either the cause or effect of an altered blood reaction. I am, however, making at the moment no other claim than this: that the proved sensitiveness of the normal centre should not deter us from examining the reaction of the blood in cases where no marked dyspnœa exists.

Adjustments in Relation to Diet.

In any case this sensitiveness is extraordinarily great, and the exact adjustment of the various factors concerned in the maintenance of a normal mean reaction in the blood is clearly a phenomenon of the greatest physiological importance. Hasselbalch[4] has made a very careful study of the adjustments which happen when the diet is varied. As the result of different dietaries considerable variations occur in the relation between available bases and the acids produced in metabolism. If the hydrogen ion concentration of the blood be measured *in the presence of equal tensions of CO_2*, then it will be found greater upon a flesh dietary than upon an alkaline or vegetable dietary, but if at the same time the alveolar tension of CO_2 (which measures the blood tension) be examined, it is found to be lower on the flesh dietary than upon the vegetable. If now the blood reaction be measured in each case in the presence of that tension of CO_2, which is found to be produced by the dietary concerned, it will be found identical in each case. Any increase or decrease in the acidity which is due to acids other than carbonic acid is compensated by a diminution or increase in the latter. The respiratory centre is here playing its part in regulating the action of the blood, but the kidney also plays its part. The hydrogen ion concentration of the urine is consistently higher upon the flesh diet and lower upon the vegetable diet. The lung controls the H ions due to CO_2; the kidney controls those due to other acids. The two agencies combined help to maintain a mean normal reaction in the blood with that extreme nicety which we have been discussing. The kidney indeed, as Haldane points out, must be as sensitive to change in reaction as is the respiratory centre itself. The existence of buffers in the blood first of all keeps any possibility of change within small limits; the respiratory centre approximately adjusts any changes of a sudden sort; while the kidney is perhaps the main regulator of reaction. It may well be that other physiological mechanisms are as sensitive to the reaction of the blood as are the kidney and the respiratory centre. We know, indeed, from the work of Mathison[5] that another nerve centre, the response of which happens to be easy to observe, is sensitive to the reaction of the blood. The vasomotor centre responds at once by increased activity when the hydrogen ion concentration increases, and if it be less sensitive than the respiratory centre, there is no doubt that its response to increased acidity is of physiological importance. The response of other mechanisms may be less easy to observe in the intact animal.

OXYHÆMOGLOBIN AND VARIATIONS IN BLOOD REACTION.

But we have not yet finished with relations between the chemical reaction of the blood and the processes of respiration. They are displayed further on lines quite different from those hitherto considered. As you are all doubtless aware, the stability of oxyhæmoglobin is affected in a most significant manner by minute variations of reaction. In 1904 appeared a very important paper by Bohr, Hasselbalch, and Krogh[6] in which it was shown that on exposure to a given tension of oxygen blood takes up progressively less of that gas as the amount of CO_2 simultaneously present increases. The effect of CO_2 is to diminish the stability of oxyhæmoglobin, or, to put it more precisely in Barcroft's phrase, its presence lessens the "effective concentration of oxygen." In order, for instance, to produce a given degree of saturation of hæmoglobin in the presence of 40 mm. CO_2 pressure the concentration of oxygen must be about twice the value which would be needed in the absence of CO_2.

The Danish workers were fully alive to the significance of their discovery in connexion with tissue respiration, but the extremely important work of Barcroft and his colleagues, supplemented by that of Haldane and Douglas, has given quantitative precision to our knowledge of the phenomenon, and has made clear its great practical importance as well as that of other facts closely related to it. In the first place it has become clear that the carbonic acid acts not specifically but *quâ* acid. The effect once more is due to an increase in H ion concentration. The curve which relates variations in the percentage saturation of hæmoglobin with the changes in the oxygen tension to which it is exposed is displaced by changes in the effective acidity of the blood. It is not modified in form, but is displaced by increase of acidity in such a way that any given oxygen tension corresponds to a lower percentage saturation, the displacement being proportionate throughout the curve. With a reduction in the H ion concentration the displacement is in the opposite sense. This sensitiveness of oxyhæmoglobin to hydrogen ions plays a great part in connexion with its function as a carrier of oxygen to the tissues. The high CO_2 tension in the tissues directly increases to a very marked degree the "capillary pressure head" (as Barcroft calls it) of the oxygen which is available for determining the delivery of oxygen to the cells.

Indications Afforded by Oxyhæmoglobin Dissociation Curve.

In the hands of Barcroft and his co-workers the use of oxyhæmoglobin dissociation curves has given an extremely convenient method for detecting variations in the reaction of the blood of individuals under this or that condition. It determines extraordinarily small variations and only needs standardising to give an absolute measure. Suppose an individual has suffered some change of conditions and we wish to know if they have affected the chemical reaction of his blood. If, then, using 1 c.c. or so of blood one or two points on a curve are determined in the presence of the individual's normal alveolar CO_2 tension, we can learn whether or not other acids have been added to his blood. If the same determinations are made in the presence of an amount of CO_2 equal to the alveolar tension under the special existing conditions we can tell whether the blood has or has not actually changed in reaction.

[6] Skandinavisches Archiv für Physiologie, 16, 330, 1904.

Variations in the dissociation curve have proved to be of such practical importance that Barcroft has felt the necessity of introducing a new nomenclature in connexion with them. When the curve is normal it is proposed to speak of the blood as *mesectic*. When the curve is so displaced that more than a normal amount of oxygen is taken up at any given tension the blood is *pleonectic*. In cases when the absorption is proportionately subnormal the blood is *meionectic*. The effect of various conditions on the dissociation curve has been fully studied. Severe exercise, for instance, produces meionexy even though the carbonic acid tension of the blood is reduced. This is because lactic acid circulates in quantity more than sufficient to compensate for the diminished carbonic acid. The body gains by the increased hydrogen ion concentration in the blood, alike from the stimulation of the respiratory centre and the accelerated unloading of oxygen in the capillaries. Living at high altitudes induces a low degree of meionexy, which is sufficient, however, to be detected by close examination of the dissociation curves, and to correspond with an increase in H ions necessary to induce the increased activity of the respiratory centre. The acid which, in this case, just overcompensates for the diminution in carbonic acid seems, oddly enough, not to be lactic acid (Ryffel). A high degree of meionexy, however, due to increase of lactic acid in the blood, results from exercise at high altitudes. Barcroft calculates from data obtained on Monte Rosa that a rapid climb of 1000 feet starting from an altitude of 9000 feet reduced a normal hydrogen experiment of 7·29 to one of 7·09. This represents a very marked change in the chemical reaction of the blood.

In general it may be said that, other things being equal, so long as the blood remains mesectic an individual feels normal, even though the condition is maintained by the circulation of abnormal acids. If the blood becomes meionectic or pleonectic he feels unwell. But meionexy is not the efficient cause of mountain sickness. On the whole its establishment at high altitudes is possibly physiologically advantageous. Mountain sickness is probably due to a want of oxygen in the brain itself (Barcroft) which is established in spite of, rather than as a result of, the diminished alkalinity of the blood. The blood dissociation curve as an index of blood reaction has already become the subject of clinical studies. As you may be aware, Ryffel and Poulton, using Barcroft's methods, have shown that in cases of uræmia there may be marked meionexy due to excess of acid in the blood. The abnormal acid would seem not to be lactic acid. A very important research inspired and carried out on the clinical side by T. Lewis, and in the laboratory by Barcroft and others, has shown that clinical cases exist in which dyspnœa is a prominent symptom but from which an equivalent cyanosis is absent. The fundamental factor in these cases seems to be a renal deficiency which results in an increase in the proportion of acids to bases in the blood. The symptoms are really an expression of the consequent meionexy.

I have dealt very briefly with the very pregnant facts concerning the effects of blood reaction upon the transport of oxygen, wishing only to adduce them in illustration of my general theme. Others better entitled to deal with them in detail may come to occupy my present position. The labours of Haldane and of Barcroft certainly find fitting reference in these lectures, for nothing could prove more completely how our knowledge may advance by means of "experiments upon man himself," nor is any physiological knowledge more likely to add to our understanding of disease. A full account of the work and a most interesting discussion of its bearings will be found in an admirable book just published by Barcroft. In 1862 William Sharpey spoke with satisfaction of the advances then being made "in the chemical examination of the tissues and fluids, especially of the blood." He would certainly have found still greater satisfaction in the progress of the present moment.

THE BLOOD REACTION IN CLINICAL DISEASE.

The effects of changes in the blood reaction upon the respiratory mechanisms, nervous and chemical alike, are, as we have seen, of the clearest kind. It must be confessed that no evidence of similar cogency has been yet obtained concerning their effects upon other bodily functions, at least in respect of variations which may occur spontaneously. The existence of the clinical condition described by Lewis and Barcroft is proof enough that an altered blood reaction may be responsible for symptoms in disease, and I am quite sure we ought not to be deterred from suspecting its existence in any particular case merely because marked dyspnœa is absent. The disease itself may depress the sensitiveness of the respiratory centre. But I propose to say a little concerning the observations that have already been made in connexion with clinical disease.

As you will understand, I am not directly concerned with the phenomenon of acidosis in a general sense, but for the present at least only with the actual reaction of the blood. Abnormal acids may, as we know, circulate in the blood in many pathological conditions, but because of the high efficiency of adjustment in the body, they may long do so without producing a change in the actual reaction. Such a change we should expect only when the mechanisms concerned in the adjustment are overtaxed, or when they become themselves abnormal. We need direct proof of a real change of reaction in order to be sure what events may be correlated with it. But published estimations of the actual hydrogen ion concentration in the blood of disease have, so far, been but few, and for the most part of too little accuracy for us to build much upon them. The electrical method, as I have said, has only recently become available for proper estimations in the blood, and absolute accuracy is still difficult to secure with it. Barcroft's method is, I believe, really more satisfactory at the present moment, and one is glad to know that more than one observer in this country is making use of it upon clinical material.

Observations in Various Conditions.

The only published observations of a considerable variety of conditions are those of Michaelis and Davidoff, who use the electrical method. Most of the results they obtained lie near to normal values, but they represent apparently single observations mostly made upon only one case of each disease. In diabetic coma they found a definite diminution of effective alkalinity. This finding we have, of course, long been led to expect, though the occurrence of any change of blood reaction in this condition has been denied. Some of the denials have been based upon results got by unreliable methods, and the question cannot be considered as settled. Kennaway, Pembrey, and Poulton[7] have lately pointed out that the alveolar tension of carbonic acid is the best guide to prognosis and treatment in diabetes. A value below 25 mm. is, according to these authors, of grave significance, and one below 20 mm. indicates that coma is imminent. One would think that these low values are associated with the establishment of a definite rise in the hydrogen ion. Dr. E. P. Poulton is engaged upon investigations which deal with the blood dissociation curve in diabetes. Evidence so obtained will, I have no doubt, settle the question for us.

In conditions such as those of cyclical vomiting, the vomiting of pregnancy, eclampsia, and the like, in which a possible intrusion of acidosis as a causal factor is suspected, we want clearly to know whether an actual change in the blood reaction has occurred before we can be clear as to the exact relations which exist. Michaelis and Davidoff give no data respecting these conditions. They found nearly normal values in chronic nephritis, though we have no information as to the type of the disease or of the stage at which it was studied. The older literature teems with observations showing a diminished titration alkalinity in uræmic conditions, and, as I have already mentioned, Poulton and Ryffel have discovered a real increase in the hydrogen ion concentration. The case of cancer is interesting, as while so many have found diminished alkalinity in malignant disease, the investigations of Benjamin Moore, described in 1907, pointed to a small but measurable increase of alkalinity as measured by titration. To these changes the author attached a causal significance. Michaelis and Davidoff found in carcinoma a normal hydrogen ion concentration, but it is clear that much more research will be required to establish the facts. The case of cancer blood may prove to be specially difficult to investigate from the point of view of hydrogen ion concentration. About a year ago I was engaged upon a study of the effect of certain diets upon cancer, and Barcroft examined the blood of some of my carcinoma-bearing rats. To all appearance there was a marked diminution of alkalinity, but Barcroft's scientific acumen prevented him from making a wrong conclusion on these lines. He found that the blood, owing to the existing anæmia and probably to the existence of newly formed corpuscles, showed a tendency to rapid self-reduction, and this accounted for the apparently meionectic dissociation curve. With any blood exhibiting within itself considerable metabolic change like this, an estimation of the ionic reaction may be difficult by any process. Michaelis and Davidoff found an appreciable diminution in the hydrogen ion concentration in cases with fever. This is a point of interest. It can be shown theoretically that a fluid such as blood should become more alkaline with a rise of temperature, and if, as seems to be the case, no complete adjustment due to increased acid production occurs in fever, we have good reason to believe that a more alkaline condition of the blood in fever plays its part in determining the increased metabolism. Oxidation processes are known to be increased in velocity by an increase in solution of the hydroxyl ion.

ACUTE PANCREATITIS:

A CLINICAL STUDY OF SEVEN CASES; FIVE TREATED BY OPERATION SUCCESSFULLY.

BY ARTHUR E. BARKER, F.R.C.S. ENG.,
SURGEON TO UNIVERSITY COLLEGE HOSPITAL AND CONSULTING SURGEON TO THE QUEEN ALEXANDRA MILITARY HOSPITAL, MILLBANK, S.W.

No apology is needed for recording even a single case of acute pancreatitis completely arrested by immediate operation on definite lines, but the one now first described is the second which I have recently seen and treated in the same way with recovery. And had it not been for the experience gained in the previous case[1] I hardly think the action taken in the last would have been so definite. Besides my own two cases, I am permitted by my colleagues Dr. Batty Shaw, Mr. R. Johnson, Mr. W. Trotter, and Mr. H. M. Davies to refer to further cases, five in number, which have been under treatment in University College Hospital since my first—three being equally successfully treated by operation, one fatal after operation, and one not operated on.

I am particularly obliged for this permission as a group of cases occurring close together as to time and treated by men closely associated is of special value. For few surgeons can claim to have had any very large experience of the disease in question as a field for operation, and fewer still to have had much success in dealing with it. This is a matter of some note in view of the countless abdominal catastrophes which we have all to treat nowadays. It may be best explained by the great difficulty in diagnosing pancreatic affections owing to the variety of clinical features they present in their several forms and the suddenness of the attacks. Here and there we read of individual cases met with in the course of abdominal explorations for obscure conditions, and some of these have recovered. But we are still in need of a clear clinical picture of the symptoms of acute pancreatitis and of definite guiding principles in operating for it. This may be seen from the classical and exhaustive monograph on the pancreas published in 1898 by Körte.[2] In this he reviews the whole literature of the subject up to that date, and states that as to any characteristic symptoms and signs of acute pancreatitis no advance had been made since Claessen in 1842 had expressed the opinion that "there were none." Only deep-seated pain in the epigastrium and possibly a swelling above the umbilicus, if present, were of value from a diagnostic point of view.

Since 1898 much more attention has been given hese *affections*, especially as Körte had shown uccessful operation in one case that they were able by surgical interference. Their causation, bid anatomy, and clinical history in uncom- ated cases have since been more accurately died and recorded, and some advance in our eral knowledge of them has been made. Never- less, the obscurity which hangs over these den attacks is very great, and definite charac- istic diagnostic signs are still wanting.

---

[1] Vide THE LANCET, 1910, vol. ii., p. 1264.

[2] Körte: Die Chirurgischen Krankheiten des Pankreas, Deutsche Chirurgie, 1898.

hat there are several different forms of the ease is now well known to all morbid anatomists. t whether these (most probably, if not positively, directly or indirectly infective) differ simply in virulence or duration of infection with the ne organism, or whether they depend upon culation with totally different bacteria alone combined, displaced secretions such as bile, or succus entericus from the duodenum we do not ow in spite of much study, both pathological d experimental. We do know that there is a ronic pancreatitis lasting a long time without mediately threatening life and presenting few, if y, marked symptoms until the organ is gravely mpromised by interstitial fibrosis; also that ere is an acute inflammation of the organ sociated with the escape of much blood into its bstance and around it (= acute hæmorrhagic ncreatitis); that there is a more localised suppu- *tive form* producing one or more distinct scesses in the organ; and, finally, that there is *fulminating form* in which, if the patient survive e severe shock of the onset, a very extensive and pid sloughing of the organ and surrounding ssues gives a peculiar character to the process.

What relations these several varieties have to e another is not yet clear, and space forbids me to eculate about them here or to allude to the rious views held in regard to them. But it is ry desirable to keep them in mind when we have uch general abdominal work to do, and in perating to note every morbid change *in vivo* in nd around the pancreas which may help to explain em. Now that the patients suffering from these ffections have begun to be saved by surgery, much nat is obscure about the earlier morbid changes in nd around the organ ought to be cleared up while he patient is living in a way impossible on the ost-mortem table when the disease has much later roved fatal. Moreover, there is a practical value n acknowledging the above-mentioned varieties. surgeon even suspecting that he has before im a case of acute pancreatitis will, when e has explored it, be able without loss of aluable time and a minimum of cutting and nanipulation to modify his procedure to suit the articular variety. For no stereotyped practice ppears to be suitable for all. It is one thing, for nstance, to deal with a limited acute inflammation f the head or tail of the pancreas which has eached the omental sac and can be approached nd drained through a median incision into this; it s quite another thing to attack a destructive rocess *early* which lies *behind* the peritoneum, is preading in the retroperitoneal and mesenteric issues, and has either already resulted in sloughing here or may be expected to do so ultimately, as we shall see. In the latter case an anterior incision and draining of the omental sac will *not* be adequate and a lateral one in the flank should be made to give access to the retroperitoneal area around the pancreas by burrowing behind the serous membrane, as was done in the first and last of these cases recorded below, and was suggested by Körte long ago. Had this been done in my earlier case (No. 2), at the outset the inflammatory process might have been arrested sooner and perhaps the second operation avoided. At all events, the serious adhesions which followed the second transperitoneal operation and which caused bad intestinal obstruction ten months later might have been prevented. This third operation, though very trying, was happily successful.

From these two cases in which it has fallen to my lot to operate for acute pancreatitis successfully I received the impression that possibly in some of its earlier stages the inflammation may be benefited, at all events for a time, by drainage of the omental sac. But where there has been much extravasation of blood or pancreatic juice at the onset, subsequent so-called "fat necrosis" and sloughing are sure to follow, and will require sooner or later to be drained, and this is most easily and safely done from behind by a tube introduced through the retroperitoneal tissues. In my earliest case (No. 2) simple drainage of the bursa omentalis was all that was done *at first* and with much temporary benefit, all the symptoms having subsided by the ninth day, when the stitches were removed from the healed abdominal median wound. Then after this deceptive pause the trouble recurred, and at the end of four days a swelling was found in the splenic region and reached by a transperitoneal incision in the left flank. This revealed advanced *subperitoneal* fat necrosis, as well as a large collection of blood-stained fluid in the peritoneum near the spleen. Drainage of both areas was followed by recovery, and the patient remains well. It seems obvious that had retroperitoneal drainage been provided in the first operation the second might have been unnecessary, and the intestinal adhesions requiring a third might have been prevented.

It seems also clear that it takes some time after the initial lesion for a necrotic process to develop an abscess (in this case nine or ten days), and that the drainage of the omental sac, though immediately beneficial, was not adequate to arrest it. But in the other two cases, Nos. 3 and 4, successfully operated on by my colleagues, the collection had actually burst into the omental sac and drainage of this cavity was sufficient, sloughs and pus coming away in large amount. Sloughs and altered blood clot also came away ultimately in my last case (No. 1) through the retroperitoneal opening in the flank, *but much later*, and I assume that the disintegrating process had only just started when I operated. As a matter of fact, the retroperitoneal drainage was interrupted by the premature shortening of the tube, which we thought was indicated by a temporary general and local improvement of conditions, and it was only when a fresh and larger one was reinserted right up to boggy tissue behind the pancreas in the middle of the fifth week that the products of disintegration came away freely with sloughs and altered blood clots and with rapid and permanent improvement. Still, the first tube as long as it worked was beneficial. Had it been left unshortened the process might have been cut much shorter. But feeling one's way on almost untrodden ground such as this is no easy matter. My idea in putting in a retroperitoneal drain at once was to anticipate changes which had been seen to follow even where the omental sac had little or nothing in it, and to minimise the spread of the process in the retroperitoneal tissue as far as possible, as free drainage even of serum will do in other conditions.

It is worth emphasising once more that in my own two cases the destructive process in the subserous fat followed its chemical splitting up by the pancreatic juices at some considerable interval of time: as far as I can judge by symptoms and temperature chart at about the end of the second week. In Case 3 extensive sloughing was found four weeks after the onset. In Case 4 a grumous collection of broken-down blood clot 57 hours after the onset, which was very clearly indicated as to time. Fig. 1 (Case 5) shows the appearance of the pancreas five days after a well-defined onset; so far no sloughing is to be seen. Fig. 2 (Case 6) shows the condition 24 to 30 hours after the onset, beginning at 2 P.M. the previous day. Intense congestion and some fat necrosis are the only changes seen. It seems probable also from what was seen in my own two cases that every lobule of fat affected in this way does not necessarily lead up to suppuration. Many outlying lobules of whitened fat were seen in the omentum far from the pancreas. They gave rise to no sign during convalescence which could indicate that they had become the foci of inflammation. Probably they were absorbed in course of time. It may be that outlying lobules escape bacterial invasion, and that this is necessary for the sloughing usually associated with pancreatitis. But that the fat-splitting plays a part in this sloughing, and that this is more marked close around the organ where the bacteria would be more numerous appears more than likely.

An interesting observation bearing on this point was made by Körte (*loc. cit.*) in operating for acute cholecystitis. Here he noticed a "typical fat necrosis" with much peritoneal irritation, but without any ascertainable disease of the pancreas. A year later, in operating on the same patient for an impacted stone in the common duct, he found that all trace of fat necrosis had disappeared. It seems possible, however, that at the first operation a mild pancreatitis may have been overlooked. This would have accounted for the peritoneal irritation which is described as very marked. We have still much to learn both as to the nature and exact mode of production of fat necrosis in and around the pancreas, in the mesentery and omentum. But as a practical point, when it is recognised on exploring the abdomen in an acute case, it is the most valuable guide that we possess as to the nature of the ailment. In my own two cases it led almost at once to the right conclusion and to the right steps in treatment. When attention was first drawn to "fat necrosis" by Balser[3] in 1879–82 it was wrongly interpreted. Langerhans appears to have been the first to point out that the change in the fat cells was due to the fat-splitting effect of the pancreatic secretion, after which the fatty acids combine with calcium to produce the white material which is so characteristic and which leads to the destruction of the cells.

Later Hildebrandt proved experimentally that either an engorgement of the organ with its own secretion or with blood, or the escape of its own secretion into the peritoneum will produce typical fat necrosis in the pancreas itself, in the mesentery or omentum. If this be so there may be several ways in which the change may be produced. Injury as in some recorded cases; anything which arrests the passage of the pancreatic juices into the common bile-duct, whether it be a gall-stone or pancreatic concretion; inflammatory swelling due to infection in its duct, or, as suggested at the last International Medical Congress by Dr. Archibald, of Montreal,[4] a spasmodic contraction of the muscle around the outlet of the common duct into the duodenum due to irritating material in the latter may cause retention and ultimate extravasation of the fat-splitting pancreatic secretion; and those first changes noticed in early cases. Bacterial infection will do the rest, and in due time lead to extensive sloughing.

If this broad conception of the process be correct immediate and prolonged retroperitoneal drainage of the fat around the organ would appear to be the rational treatment. At all events this was the conception in my mind in the first of the cases in the list given below, and the result of the drainage was success in arresting the process, although the drainage was interrupted for some days. In another seventh similar case operated on during my absence last Easter in one of my beds by Mr. H. M. Davies success followed the same *retroperitoneal* drainage through the right flank. The details will be published later.

The following notes are abstracted from the more voluminous clinical reports of the cases, but contain all the essential facts and observations made at the time.

CASE 1.—On Nov. 12th, 1913, I was hurriedly called by Dr. A. Binning, of Hatfield, to see a patient who had been suddenly seized with very severe abdominal symptoms the previous evening; and I may say at once that it was to Dr. Binning's promptness in recognising the gravity of the condition as much as to anything done by operation that the patient owes his life.

The patient had been in the army and had served abroad. Health always excellent until recently. Physique splendid but inclined to stoutness. Family history good. At 12 years of age had typhoid; was ill 13 weeks. Had fever for four days in Malta in 1904 but none since. Has had colicky pains at times, relieved by wearing a belt. Earlier in 1913 had a severe attack of abdominal pain and shivering, which caused him to roll on the floor; this passed off the same night. No syphilis or gonorrhœa. Lived very generously, drinking about 4 pints of beer and occasional spirits daily and eating much. Before the present attack he had for 12 months no energy and frequently vomited greenish fluid in the morning. Smoked cigarettes by preference.

The present attack began on Nov. 8th. The patient had felt tired and drowsy all the afternoon and evening; no pain. Had had usual four pints of ale and one glass of port. Nov. 9th: Better, but tired and drowsy as before; vomited phlegm at 7 P.M., and again at 10 P.M., when there was a sharp pain across the abdomen "as if something had given way," and which kept getting worse until the operation. Nov. 10th: Had had no sleep and could not stand up for the pain; felt sick all day but did not vomit. Nov. 11th: Saw Dr. Binning and was sent to bed. Bowels acted after calomel. Nov. 12th: Was much worse in the morning; pulse 116. I saw the patient at 2 o'clock.

The appearance of the patient indicated a very grave intra-abdominal catastrophe. The pain was exceedingly severe and vomiting had taken place. Pulse feeble, 120, temperature 100·2° F. Face wore a look of great distress and was pale and cyanosed. The abdomen distended, and this was increasing. It was soft below, harder above the navel, where the pain was most intense. Tenderness was extreme above and on each side of the umbilicus, but most over the head of the pancreas. Tumour could not be made out on account of rigidity. No specially distended coils. No particular tenderness or dulness over the appendix. Flanks clear on percussion. The vomited matter was bilious and contained no blood. My diagnosis was provisionally perforated gastric or duodenal ulcer, but pancreatitis was considered.

[4] E. Archibald: Transactions of International Medical Congress, Section VII., Surgery, p. 21.

Operation on Nov. 12th at 8 P.M., assisted by Dr. Binning. Median incision above the navel showed much intraperitoneal turbid fluid as in my earlier case No. 2 and in No. 4. This lay mostly in the upper abdomen over the right kidney. The stomach was carefully examined anteriorly and through the omental sac, opened for the purpose. It was quite sound. The omental sac contained no fluid. Great congestion and general shagginess of the peritoneum over the head of the pancreas was very striking. The organ was swollen to the size of a large fist at its right end, and showed fresh exudation of lymph. When the depression to the right of the duodenum was sponged dry the peritoneum was seen to be bulged forwards with chalk-white subperitoneal fat in which were a few hæmorrhages. This white material extended on the right of the spinal column from the head of the pancreas upwards to the liver border. It had not broken through its serous covering. Its appearance was so characteristic taken with the swollen pancreas as at once to clear up the nature of the disorder. It was obviously very acute pancreatitis in a fairly early stage.

The problem now was what to do. It was no use to drain the sac of the omentum, as was done in my earlier case, as it was empty and there were no signs of the process advancing into it. On the other hand, it seemed risky to incise the swollen area and allow the inflammatory products to escape into the peritoneal cavity and drain through this, in view of the serious adhesions from similar drainage which nearly cost my earlier patient her life. I therefore made a two-inch incision below the last rib on the right side and deepened it down to the subperitoneal fat. With my left hand within the abdomen between the duodenum and the kidney I got the direction and then tunnelled with the right forefinger through the fat behind the peritoneum up to the head of the pancreas. This was not so difficult as expected. A long large drainage-tube was introduced along this track to the head of the organ to provide for the escape of serum in the first place and the products of the inflammation as they were formed. As an extra possible drain for the pancreas the gall-bladder was drawn into the upper angle of the abdominal wound and stitched there. It showed no signs of disease, contained no calculi, and could be emptied by gentle pressure into the duodenum, showing there was no obstruction of the cystic or common duct. When opened it was found to contain perfectly normal bile (*vide* note of Nov. 27th for contrast), which was drained by a rubber tube into a bottle outside the dressings. The median wound was then stitched up in layers. The intestines had been seen to be a little distended and hyperæmic, but not paralysed; there was much turbid fluid to be mopped away in the upper part of the abdominal cavity.

The patient's condition during the operation was generally good, as reported by Dr. Dudley Buxton, who gave the anæsthetic (chloroform plus oxygen). Pulse at the end 120. The next day the condition was improved; pulse 110 to 116. During the first week the chief features of the case were reduction of pulse-rate and temperature, profuse sweating, sleeplessness, restlessness, and tendency to wandering at night; cyanosis still notable at times. There was also an attack of foul diarrhœa on the fourth day. In the second week general improvement; pulse 88 to 93; but temperature 97° to 101°. Profuse sweating continued for first four weeks. After the diarrhœa on fourth day there was always constipation and flatulence, only relieved by enemata. At no time was fat detected in the motions, though looked for carefully. The stitches in the *anterior* wound were removed on the twelfth day (Nov. 23rd); perfect primary union. Gall-bladder in upper angle draining well.

Third week much general improvement; food taken well. The gall-bladder yielded abundance of pure clear bile. The tube in the flank drained so little and the progress generally seemed so favourable that it had been shortened by degrees to about two inches. On Nov. 27th (sixteenth day) temperature rose to 101° for the whole day, and at this time Dr. Binning noticed a deposit in the bile bottle, which was proved by microscopic examination to be pus. It amounted to about an inch deep in a six-ounce bottle. This pus came away in the bile freely for about a week from the 27th, the temperature at the same time falling steadily to normal on the 31st. On Dec. 3rd the temperature rose once to 102°, then dropped to absolute normal for 4th, 5th, and 6th, on the 7th it again began to oscillate about 100° to 101°, and on the 10th it once touched 102°. This fairly regular oscillation lasted for the next two weeks each day and then fell permanently to normal with the re-establishment of free drainage from the track in the flank which had become partly closed.

During the week of highest temperature (Dec. 9th to 16th) the patient had two nervous explosions of a very startling kind with a day of very good condition in between them. They had been preceded by the disappearance of the pus in the bile, which had been abundant for 12 days, and by the fall in temperature mentioned above. On some of the previous days severe headache had been complained of and vomiting had occurred, but on the 8th, 9th, and 10th he was noted as having had "very comfortable" days without headache or sickness. Then on Dec. 11th, at 5 P.M., he had the first of these strange attacks, which I can only suppose were of the same nature as the "tetany" seen sometimes with pyloric obstruction and in cases of severe diarrhœa in children, and described by Dr. F. J. Poynton and others. The nurse's notes, which were admirable all through the case, may be given in abstract as checked by Dr. Binning. "At 5 P.M. patient felt very faint; complained of not being able to see or breathe properly; pulse quick and small. 5.30, suddenly became rigid for a few seconds and unable to speak; remained so for nearly 30 minutes; convulsed at intervals." At 6.30 saline rectal injections were attempted, but excited the patient, who then commenced to scream and get violent; tried to vomit. Violent and convulsed off and on until 7.10, when he was seen by Dr. Binning, who described this condition to me at once over the house telephone, and suggested putting the patient under chloroform, to which I agreed. This was done at 7.30 with immediate effect. At 8 o'clock he was again awake, quite sensible and quiet; temperature 101°, pulse 114. He was soon inclined to sleep and had a quiet night; passed 8 oz. of clear normal urine. A sample about this time sent to University College Hospital for analysis. Dr. F. H. Thiele reported that the Cammidge test gave a positive result. The following day and night were very comfortable, the sweating was gone, urine free, normal.

On the 13th a similar attack to that on the 11th occurred, but less severe. He was "wandering" frequently during the evening, but slept well the following night and seemed to have no recollection of the attack. I saw the patient the next day, and feeling that the shortening of the tube in the flank might have contributed to the fever, &c., as very little discharge came from it now, I enlarged it with my finger as far as I could reach. At a depth which must have been close to the duodenum the finger came upon a quantity of pulpy material behind the peritoneum. Into this I pushed a longer and larger drain-tube. This was all done under light chloroform anæsthesia. The fomentations were continued as before.

From this on there was no further serious trouble. Very free discharge was soon established through the tube, and several sloughs, large and small, came away during the next 12 days, which on examination were believed to be bits of the pancreas. Small portions of broken-down old blood clots were frequently noted, and also from the 22nd to 29th that "small white spots" were present in the discharge, which during that time was very offensive and varying in amount. After the reinsertion of the tube on Dec. 14th the temperature varied between 98° and 101°, and on the 24th it touched 102°. After this, as the discharge from the flank became free and offensive, the temperature fell to 99°, and a couple of days later to normal. After Dec. 25th the retroperitoneal discharge became less and less in amount and in foulness, and the tube could be gradually shortened. The last slough came away on Jan. 5th. After this convalescence was rapid and the patient was able to go to the seaside at the beginning of February. The relation of the appearance of much pus in the bile, and the tetany, to defective drainage from behind seems clear, especially as these symptoms disappeared and convalescence was rapid when the tube had been effectively reinserted and acted well.

CASE 2.—Mrs. A, aged 40, was admitted into University College Hospital on Feb. 21st, 1910. Two days earlier severe griping pain set in above the navel. She vomited and trembled with pain, but there was no definite *rigor*. The pain was paroxysmal. Bowels confined *since Feb.* 13th, no flatus; no result from two enemata on 21st. Past history: Six years ago a similar attack after birth of first child, accompanied by vomiting and constipation. Describes another lasting 48 hours soon after the birth of the last child six months ago; no jaundice. Present state: Well nourished; no facies suggesting acute peritonitis. Temperature 101·4° F.; pulse 124. Abdomen soft and not distended. Pain in epigastrium, left hypochondrium, and left lumbar region. No dulness in flanks; liver dulness normal. No blood, sugar, or albumin in urine. No shock, but patient looked very ill. Diagnosis doubtful; exploration necessary.

Operation on Feb. 21st at 9 P.M. Median incision below umbilicus. There was a considerable amount of thin, slightly turbid fluid in the general peritoneal cavity. The small intestine wherever seen was markedly injected, slightly dilated, but not paralysed. Search throughout its length for anything abnormal was negative except for a few flakes of lymph above. The colon was then drawn down and spots of "fat necrosis" were seen in the omentum, which at once suggested to me the true nature of the case as one of acute pancreatitis. The omental sac was opened between the stomach and colon. There was no fluid in it, but more patches of fat necrosis were seen, in greater number as the pancreas was approached. The organ itself was hardened especially about its head, but there was no evidence of breaking-down tissue or hæmorrhagic change around it. Nothing more than drainage of the omental sac was done. The wound was closed after a piece of omentum containing fat necrosis had been excised for examination. The change in the fat lobules was typical and showed up grass-green with Benda's stain. (Contrast Fig. 1 from Case 5.)

The patient rapidly improved and the stitches were removed on the tenth day; primary union. On March 3rd (eleventh day after operation, thirteenth after onset) severe pain set in "from nipples to navel." There was tenderness over the whole abdomen, but most at the tip of the right ninth costal cartilage. Pulse 124; temperature 98°. At 10 A.M. morphia was given, but pain continued all day. Vomiting began at 4 P.M. up to 2 oz. in three acts. March 4th: Temperature 100° in the morning and 101° in evening. Vomited in all 12 oz. Seemed better in spite of pain; abdomen not distended any more. Pain had shifted to tip of left tenth costal cartilage.

On March 5th the pain and tenderness had increased; temperature 101°. In the evening under chloroform a swelling was now felt in the left hypochondrium, and I made an incision commencing 2 inches to the left of the umbilicus and running backwards and upwards for some 4 to 5 inches. Fat necrosis was at once recognised in the subperitoneal tissues, and portions were removed for analysis. The peritoneum was then opened far back, and about 6 oz. of blood-stained fluid mixed with pus escaped. This was followed by very free venous bleeding, which ceased on the introduction of a large drain-tube. The mass felt before the operation was now found to be the enlarged body of the pancreas. The spleen was not enlarged. For the next five days there was steady improvement, with much discharge. Temperature generally about 100°. There was a return of pain in the right hypochondrium on March 10th, with rise of temperature to 102° and vomiting; no rigor. This severe pain continued over a palpable mass below the navel; no jaundice. The pain then subsided and steady convalescence followed.

The patient was discharged well on March 31st, 1910. She remained well until the following October, when she was re-admitted for bad intestinal obstruction by band and volvulus in the left flank. This I released by a third operation through the old scar in the flank. She has been well ever since. On this occasion I examined the conditions in and around the pancreas and found nothing abnormal remained from the former attack. Had retroperitoneal drainage been carried out somewhat earlier it seems probable that the peritoneal adhesions requiring this third operation would not have been produced. The notable improvement for 11 days which followed the drainage of the omental sac was deceptive. Around the pancreas the disintegrating process was steadily advancing and could only be approached from behind.

CASE 3.—The patient, a widow aged 42, was admitted into University College Hospital on April 3rd, 1911, complaining of "pain in the stomach soon after food for the last four weeks." It was stated to go through to the back and be relieved by vomiting. It sometimes occurred immediately, sometimes two or three hours after food. The vomit at first was dark, then in last few days greenish. She described a similar attack in previous August; was subject to "biliousness." On admission there were rigidity of abdominal wall and general tenderness, most severe in right epigastrium. Frequent vomiting occurred, and rectal feeding was adopted. On April 11th, under an anæsthetic, a mass of the size of a coconut was found in the umbilical region. It was distinct from the liver and well defined below; movement with respiration doubtful.

On April 12th Mr. H. Morriston Davies made a 3½ inch vertical incision through the upper part of the right rectus muscle half an inch to the right of the middle line. An elastic mass was found behind the stomach and transverse colon. Above, it reached to the liver, below to 3 inches below the navel, and on each side 3 inches from the latter. The small intestines were found adherent to the cystic mass below the colon, and on separating them an opening was made into it accidentally, dark grumous fluid escaping. The parts had been previously packed with gauze. More fluid followed by a large sloughy mass was squeezed out. It proved to be part of the pancreas. The upper part of the swelling was firmly adherent to the transverse colon and pressed upon the duodenum and bile ducts. Gall-bladder distended but healthy. The cavity was further opened between the stomach and colon, and about a pint more of the grumous fluid evacuated. Both openings above and below the colon were drained with large rubber tubes brought out of the abdominal wound, which was stitched up. Convalescence progressed steadily, some irritation of the skin from the discharge being the only check. On May 1st another large slough came through the upper opening. All well by May 18th and patient left for home on 19th. The temperature was never very high, 100·6° F. being the highest on April 20th; after this the average was 99°.

CASE 4.—The patient, a man aged 39, was admitted to University College Hospital on Sunday, August 6th, 1911, at 12 noon, for pain, vomiting, and absence of stools for 48 hours. Until recently had been in usual health and only returned from a week's holiday in the country the previous Monday. Violent pain in abdomen set in 48 hours ago sufficient to make him rest, but it passed off and he went to work. At midnight the pain returned intensely and he vomited at first food, then bile and slime. No sickness since noon on Saturday. But the pain had persisted always in the umbilical region without radiating. No flatus or stools since Friday in spite of enemata.

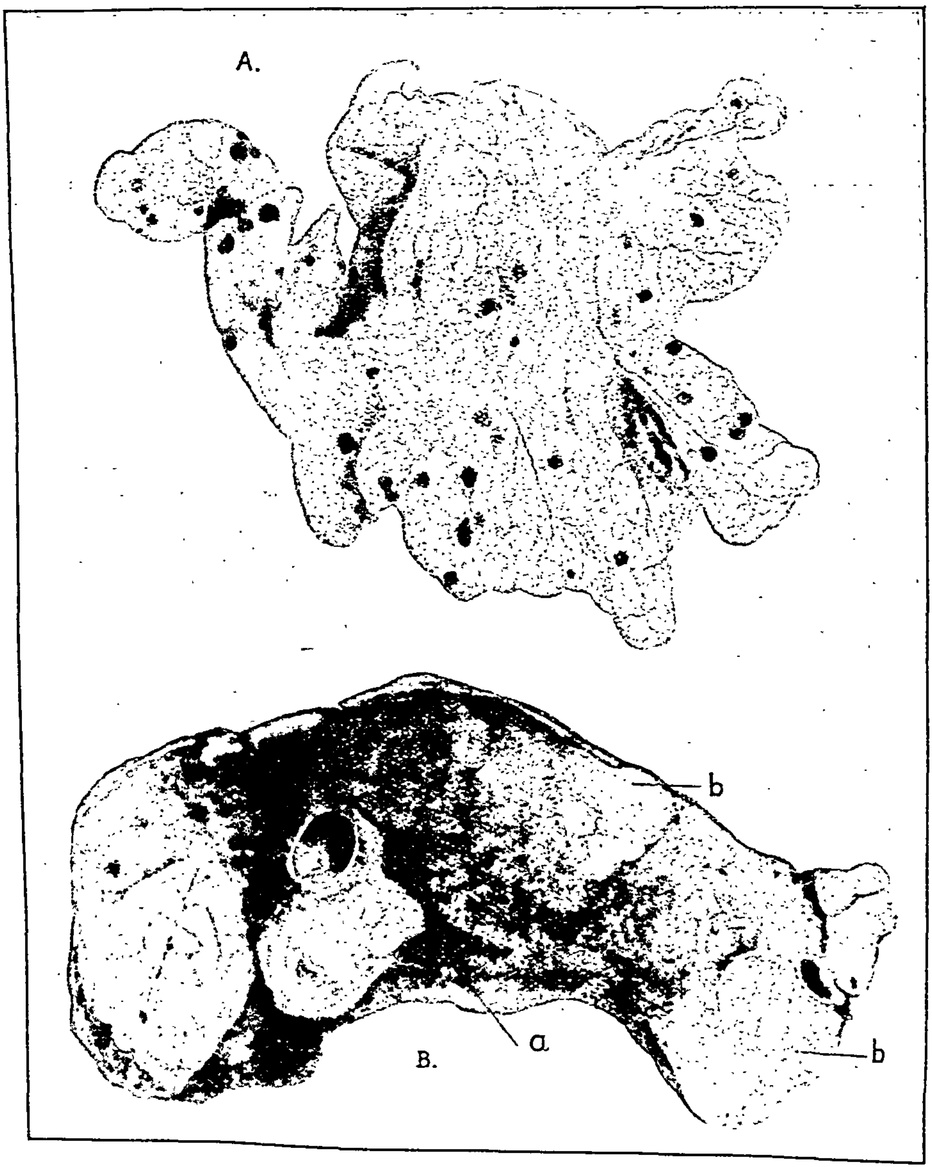
Previous history: Described a similar attack in July, 1906, with intense pain in the abdomen for two days with vomiting and constipation. He remained in bed then for 11 weeks with symptoms apparently of gastroenteritis. In 1907 he had a similar attack and was in bed for three weeks. In 1908 a third attack like it; in bed one week. Since then quite well on careful dieting. Never jaundiced; never lived abroad. Influenza 20 years ago.

Present state: Looked ill and anxious and complained of pain in abdomen; resented being moved. Temperature 100° F.; pulse 108. The abdomen moved fairly to respiration; was distended generally; umbilical region specially prominent, more on left than right. No bulging in flanks, but slight shifting dulness; otherwise resonant. Liver dulness normal. There was tenderness, not very marked, below the navel more to left than right, but no hyperæsthesia of the skin. Owing to rigidity no definite tumour could be felt anywhere but the resistance suggested distended gut. No visible peristalsis. Organs sound; rectum empty. At 4 P.M. bowels still not moved; no vomiting. Temperature 99·4°; pulse 112. At 6 P.M. pain and distension more marked; pulse 120.

Operation by Mr. Wilfred Trotter on August 6th at 9 P.M. Median incision below navel. Much yellowish peritoneal fluid escaped; no obstruction of bowel; appendix normal. Small bowel in middle of its length distended and hyperæmic, but no peritonitis. Mesentery dotted with fat necrosis. Incision prolonged upwards; gastrocolic omentum bluish in colour, bulged forward by fluid in omental sac. On incision dark, blood-stained fluid welled out quite unlike that in the general cavity of the peritoneum. This was explained by the fact that the foramen of Winslow was closed by lymph. About 1 to 1½ pints of liquid escaped from the sac of the omentum, which was sponged dry. The pancreas was now seen to be greatly swollen, covered with lymph, and its central part very dark, much enlarged, and infiltrated with blood. No incision into the organ was made, reliance being placed on drainage of the omental sac. This was provided for by a rubber tube and gauze enveloped in oil silk going down to the pancreas. Wound stitched up round these.

Condition after operation fair; pulse 120; respiration 32; some cyanosis. At midnight shock was marked, but gave way to restoratives. August 7th: General improvement; temperature 98°; pulse 120; flatus passed; no vomit; urine normal, no sugar. From this on to August 27th steady convalescence; discharge less and less. The brownish particles seen in the pus of Case 1 are noted as present here too. There was no irritation of the skin from the secretions as in Case 3. The urine tested by Cammidge's method gave negative result. With the exception of some sickness due to error in diet on August 27th, there is nothing further to report before the patient left hospital on Sept. 9th quite well. During convalescence there was a tendency to constipation.

FIG. 1.



CASE 5.—Acute hæmorrhagic pancreatitis. A. Omentum showing fat necrosis stained green by Benda's copper method (the green stain comes out black in the illustration). B, Pancreas showing a, hæmorrhagic patch; b, b, fat necrosis unstained.

CASE 5.—The patient, a well-nourished man aged 52, was admitted into University College Hospital on June 17th, 1913, under Dr. Batty Shaw's care, with a history of "pains below the navel and reaching round the back, scanty urine and retching" for three days. Bowels not moved since the 15th. Temperature 99° F.; pulse 60; respiration 30. His habits appeared to have been regular; internal organs fairly healthy; occasional headaches; appetite good up to the 15th. Nothing notable in family history on past illnesses.

Present state: Pain and tenderness at umbilicus, mostly just below it; some rigidity in this region. Abdomen did not move with respiration; flanks bulging; no dyspnœa. Rectal examination negative. Washing out brought away practically no motion, but much membranous material suggesting colitis. Temperature 100·4°.

June 18th: Had been sick twice to 6 oz. At 3 P.M. vomited 16 oz. of dark brownish material. At 4 P.M feeling worse; marked hiccoughing frequently. Temperature 98·4°; pulse had risen to 120, and was weaker. Abdomen now *slightly distended; no marked increase in tenderness,* which was now most evident in the epigastrium. Intestinal obstruction diagnosed. Operation at 11 P.M. same day by Mr. Trotter; median incision. Patient died the next morning, a few hours after operation.

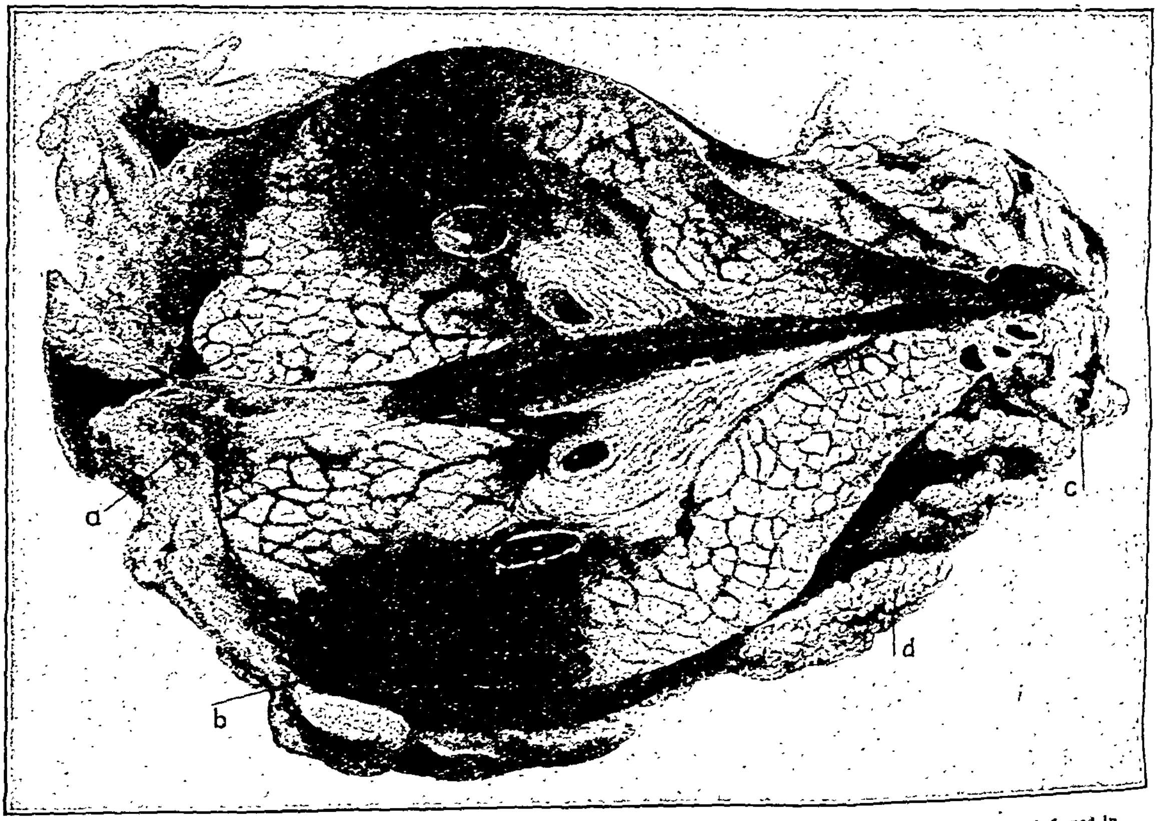
Post-mortem notes, by Pathologist, June 19th, 1913:—"Lungs: Both very œdematous and congested; extensive adhesions in pleuræ. Peritoneum: numbers of small nodules of *fat necrosis are present in the great omentum, root of* mesentery, fatty capsule of kidneys, and fat about the pancreas. Pancreas: greatly swollen, the head measuring 2 inches from before backwards; extensively hæmorrhagic and in places broken down and showing islands of fat necrosis. The duodenal end of the duct is distended with a number of small calculi; no pus present. (Fig. 1.) Liver: shows cloudy changes; gall-bladder, ducts, and bile papillæ are normal. Stomach and intestines: stomach lining shows scattered submucous hæmorrhages; these are also present in the upper part of the ileum, and some of them are ulcerated. The intestines contain brown fluid. Spleen soft, follicles enlarged. Kidneys normal."

CASE 6.—The patient, a *single man aged 65, was admitted* into University College Hospital on Feb. 22nd, 1914, for severe abdominal pain beginning at 2 P.M. on the day before and lasting ever since. The pain was not localised. Vomiting began soon after the onset and occurred 12 times before admission. Flatus but no motion passed last night. Had been in good health until the 21st. The attack came on after a good meal. When seen by Mr. Raymond Johnson cyanosis was very marked even in the fingers. The man appeared desperately ill and collapsed. Pulse 130, intermittent; respiration 38; temperature 97·1° F. Tongue dry. *Abdomen slightly* distended towards the left iliac region; did not move with respiration. Tenderness and rigidity were general. No definite tumour could be felt in the abdomen. *Nothing abnormal* could be detected in the chest.

In view of the general condition of the patient it was felt that any operation was out of the question. Mr. Johnson's diagnosis was acute pancreatitis. He thought nothing else would account for the condition of severe pain, extreme cyanosis, and collapse after sudden onset, so well, though no tumour was discoverable. The patient died a few hours after admission, and the post-mortem examination showed that he was right.

Pathologist's report:—Abdomen: "About half a pint of opaque, blood-stained fluid in the abdominal cavity; a few flakes of fibrinous exudation in places. Scattered areas of fat necrosis of small size in the omentum; larger areas in the retroperitoneal tissue below the pancreas, where also there is considerable extravasation into the areolar tissue. The pancreas is greatly swollen with much extravasation of blood on its surface and into the septa between its lobules. There are numerous white areas of fat necrosis on the surface of the organ. There is no sloughing or breaking down of the pancreatic tissue, except at one *spot*, which is somewhat softened and of a grey red colour. (Fig. 2.) Stomach: dilated; scattered petechiæ on its mucous membrane and swelling of its follicles. Spleen: small *and* diffluent. Liver: soft; no gall-stones; lining of gall-bladder and ducts normal. Kidneys soft; heart normal. Lungs both extremely congested."

FIG. 2.



CASE 6.—Acute hæmorrhagic pancreatitis. Mr. Johnson's case, Feb. 22nd, 1914 (not operated on). *a*, Wirsung's duct inflamed in middle portion. *b*, Head of pancreas much swollen and hæmorrhagic. *c*, *Fat necrosis stained green* by Benda's *copper method* (the green stain comes out black in the illustration). *d*, Unaltered fat tissue.

Looking at this group of cases and endeavouring to construct *from them* a clinical picture which may be of use in the future, one is first struck with the fact that in three the patients described similar attacks at long intervals *antecedent* to that for which they sought surgical help. In Case 2 there were *two*, one six years and one six months before the last; both after normal childbirth. In Case 3 there was one attack nine months previously. It was described as quite *similar* to the last.

not related to labour. In Case 4 the patient, a male, described three illnesses of the same kind, the first five years before (in bed 11 weeks), the second four years before (in bed for three weeks), and the third three years before (for which he remained in bed one week). In my own last case (No. 1) the attack for which I operated may have been his first. But there is a history of very severe abdominal pain and shivering earlier in 1913, causing him to roll on the floor, and lasting some hours, which may have been an illness of the same nature but not so deadly. If the present attack was the first, that and the fact that it was taken in hand early may account for the more limited area involved around the much swollen and inflamed pancreas. It may be recalled that the sac of the omentum was empty, but that there was extensive fat necrosis in the retroperitoneal tissues but no sloughing at the moment of operation. This took place later.

Another point noted as regards past history was that in two cases, Nos. 1 and 4, there was much gastric trouble for some time previous to the attacks; and in No. 2 the teeth were in very bad condition indeed, which, as we know, is usually associated with stomach derangement. In No. 3 the patient stated that she was subject to "frequent biliousness" before her attack.

In none of the cases was there anything in the history to suggest derangement of the biliary apparatus except doubtful jaundice in a previous attack in No. 2. Nor at the operations was anything wrong found in the gall-bladder. In No. 1 I opened it simply as a possible means of relief for the inflamed pancreas. The bile, which was drained through a tube into a bottle, was perfectly normal for 24 days. It was, however, of very great interest to note that at about the time when the exacerbation of symptoms followed by "fits" (tetany) came on (thirtieth day) the previously clear bile became turbid, and a considerable sediment of pus was found in the bottle for about a week. From the improvement which followed on this both in the general condition and the bile it seems clear that this pus found its way from the inflamed pancreas into its duct, then into the common duct, and thus into the gall-bladder. In Case 6 there was no time for actual destructive change in or around the organ. The patient was killed outright by the shock of the onset in a few hours, and before any surgical relief could be undertaken. Case 5, too, had not advanced to sloughing. Case 7 was precisely like No. 1, but not so severe.

The onset of the attack in all these cases was strikingly *sudden* except in No. 3, in which four weeks of "pain after food" elapsed before the condition was thought grave enough to call for admission into hospital. In the others, except for indefinite gastric disturbance, *sudden* severe pain in the epigastrium was the first and most prominent symptom. This was always described as very intense, and in my own last case (No. 1), where I had the opportunity of seeing the patient very early, the powerful man appeared to be suffering horribly and was pallid and markedly cyanosed. This cyanosis lasted some days after operation. In Mr. Johnson's case (No. 6) the suffering was very severe and accompanied by extreme cyanosis and collapse which rapidly ended in death.

The temperature in all cases was relatively low at the onset. In Case 6 it was 97·1° F., indicating severe shock from which the patient died before any operation was done. The pulse was rapid and gradually increasing while losing tension. Vomiting was usual at the onset in these cases, not so prominent a feature later. The material brought up was usually bilious with mucus. In no case was a tumour found in the region of the pancreas without an anæsthetic. In one case only was one discovered just before the operation when the anæsthetic had been given.

On opening the abdomen turbid peritoneal fluid was found in three cases at operation (and in one, Case 6, not operated on) in considerable amount. The intestines were injected and dilated in four out of the five cases operated on, but not paralysed. They had not the appearance of being actually inflamed, their lustre being unimpaired, and showing no lymph upon them. But lymph was found in three cases in the neighbourhood of the pancreas.

From the character of the discharges coming from the inflamed gland there was only evidence of hæmorrhage into or around it in three (Cases 1, 2, and 4). Perhaps the grumous fluid which came away with sloughs in No. 3 indicated broken-down clot, but it is hard to say, as the operation was performed four weeks after the onset; the attack was probably less acute than in the other instances. The omental sac was opened in all the six cases operated on, but only in three had the destructive process made its way into it.

Six of the cases here reported are the only instances of acute pancreatitis which have occurred in our hospital in the last five years. With my own private case there are six operated on by members of the staff; and it is encouraging to find that five have been saved. One was too far gone to admit of any operation, and one died the morning after an attempt had been made to arrest the destructive process by surgical interference. As the disease becomes better understood and is dealt with in its earlier stages better things may be expected.

I have dealt with this series as a purely clinical study in spite of the temptation to speculate at any length as to its pathology.

Harley-street, W.

THE annual general meeting of the National Society of Day Nurseries will be held at 35, Chesham-place, S.W., on Thursday, June 11th, at 4 P.M.

LIVINGSTONE COLLEGE: COMMEMORATION DAY.—Saturday, June 13th, Commemoration Day at Livingstone College, marks an important stage in the history of this missionary auxiliary, inasmuch as it is 21 years since the college was founded. From 3 to 3.20 in the afternoon there will be a reception by the Principal and Mrs. C. F. Harford, after which a meeting will be held in the grounds of the college under the presidency of the Bishop of Chelmsford. The speakers will include Dr. Ernest N. Cook, one of the staff of the Mengo Mission Hospital in Uganda. Dr. Loftus E. Wigram, the vice-principal, who is to succeed Dr. Harford as principal, will also take part in the proceedings. After the meeting an opportunity will be given for visitors to view the college. It will be remembered that an appeal was made last year for a sum of £10,000 to form a Livingstone Centenary Fund in order that the college might be placed on a sound financial footing. Only £640 have been received in answer to this appeal. It is hoped that before Dr. and Mrs. Harford leave the college in July next the mortgage on the property, amounting to £3500, may be cleared off. Applications for tickets should be made to the Principal, Livingstone College, Leyton, E., who will gladly receive any contributions towards liquidating the mortgage or towards the special endowment fund.

THE USE OF NEOSALVARSAN IN ACTIVE PULMONARY TUBERCULOSIS.

BY P. HORTON-SMITH HARTLEY, C.V.O., M.D. CANTAB., F.R.C.P. LOND.,

PHYSICIAN TO THE BROMPTON HOSPITAL; PHYSICIAN WITH CHARGE OF OUT-PATIENTS TO ST. BARTHOLOMEW'S HOSPITAL.

THE treatment of patients suffering from pulmonary tuberculosis in the acute and subacute stage, in which fever is present and the disease steadily progressing, is often a source of grave anxiety to the physician.

As the result of rest in bed for a longer or shorter period the temperature may gradually fall and finally reach normal, and such a condition may be permanent. But in many cases it is long before even absolute rest produces any effect, and in others it fails entirely. Antipyretics, such as cryogenin or maretin, may succeed in bringing down the temperature, but as a rule their effect is merely temporary, and when the administration of the drug is discontinued the temperature rises again. In other cases quinine may do good, or arsenic, given preferably as the sodium cacodylate by subcutaneous injection. But not infrequently such remedies fail, and a like result attends the inhalation of volatile antiseptics, the employment of intravenous injections of iodoform, or the use of such vaunted remedies as pneumosan or dioradin.

Under such circumstances tuberculin has sometimes been advised. It has not, however, been my good fortune to observe defervescence follow its use, and on other grounds its administration in acute cases does not appear advisable. Disappointing, too, has been the use of secondary vaccines prepared from the sputum, possibly because, as Dr. J. A. D. Radcliffe, of the King Edward VII. Sanatorium, and others have shown, the organisms isolated come as a rule merely from the mouth and bronchi, and are not in reality an index of a true secondary infection.

A certain number of acute cases, in which the disease is limited to one lung, are suitable for treatment by artificial pneumothorax, and if satisfactory compression is obtained the temperature falls and the patient gradually regains his health and strength to a greater or less degree. Such treatment, however, is lengthy, is not suitable for the majority of cases, and the process, moreover, is not entirely devoid of risk. Under such circumstances the following notes of certain cases treated with neosalvarsan may be of interest, for in them the use of the remedy was followed by a fall in the temperature and an improvement in the general condition of the patient.

The use of neosalvarsan suggested itself to me owing to the fact that some little time ago a patient was admitted into my wards at the Brompton Hospital suffering from extensive pulmonary tuberculosis of an active febrile type, both lungs being diseased, but the patient giving in addition a history of syphilis. On this account treatment with salvarsan was prescribed and with good results, the patient's condition being materially improved on his leaving the hospital. Shortly afterwards another patient was admitted under my care into St. Bartholomew's Hospital. She was exceedingly ill with extensive tuberculous disease in both lungs and with high fever, but without any history or evidence pointing to syphilis. So ill was she that it was believed that she would not live more than a few days. Remembering the improvement in the preceding case, I prescribed, though with some hesitation, owing to the patient's serious condition, an injection of neosalvarsan, and here again considerable improvement followed, and she was able some weeks later to be transferred to the infirmary.

Bearing the above facts in mind it appeared desirable to try more systematically the effect of neosalvarsan in the treatment of cases of acute and active pulmonary tuberculosis, in which other means had failed to bring the temperature to normal and to arrest the further progress of the disease. This I accordingly did with the help of my house physician, Dr. J. N. MacBean Ross, to whose care and skill in the treatment of these cases, as also for help in the preparation of these notes, I am much indebted.

The neosalvarsan was given by intravenous injection and for this purpose the ordinary method of procedure is best adopted. Strict antiseptic precautions must be enjoined and great care taken that the water (about 125 c.c.) in which the remedy is dissolved has been *freshly distilled.*

During the administration of the drug, as with other arsenical compounds, a watch should be kept upon the knee-jerks and the fields of vision, so that warning may be given of any possible toxic effects upon the nervous system. But none such have been observed in the 16 cases treated.

Of those reported in this paper Case 1 shows the effect of treatment in active pulmonary tuberculosis, in which, however, the patient gave a history of syphilis, and in which the Wassermann reaction was positive. The other three here detailed are cases of simple pulmonary tuberculosis of an advanced and active type.

CASE 1.—The patient, a male, aged 31 years, was admitted into the Brompton Hospital on August 18th, 1913, suffering from a severe cough of five months' duration, emaciation, night-sweats, and a very husky voice. He had been losing weight, and now weighed 9 st. 10 lb. The evening temperature varied between 99·2° and 101·6° F.; pulse, 88; and respirations, 20.

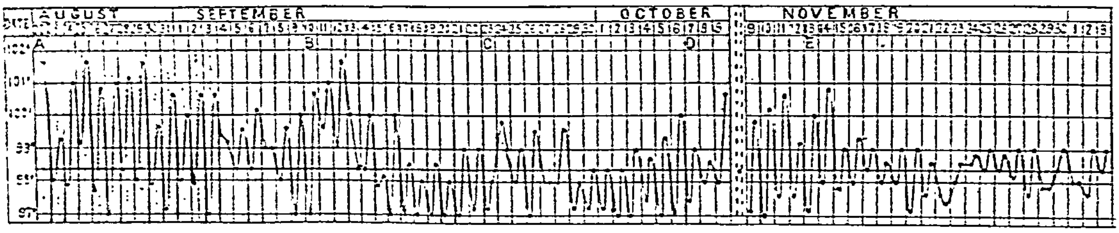
On examination signs of infiltration and excavation were detected at the right apex, and of infiltration at the left apex and at the apex of the right lower lobe. The larynx showed a general infiltration with some subglottic infiltration, the appearance suggesting the possibility of syphilis to my colleague, Dr. Dundas Grant, who kindly examined the case. The Wassermann reaction, when tested, proved markedly positive. The sputum, which was somewhat large in amount, was tested on several occasions for tubercle bacilli, and on Dec. 20th a few were discovered by the antiformin method.

The patient remained in bed, but as the temperature was still swinging (see Chart), neosalvarsan (0·9 gramme) was on Sept. 10th injected intravenously into the right arm. The patient had a feeling of malaise for some hours following the injection, but no vomiting, and there was no pain in the arm. Three days after the injection the temperature rapidly fell, and by Sept. 17th it reached normal. The cough was greatly improved, the patient felt much better, and he was gaining in weight. On the 23rd, as the temperature showed signs of rising again, a second injection of neosalvarsan (0·9 gramme) was given. This was followed by a feeling of nausea but no vomiting. The temperature steadied for a time, but soon again became irregular, in spite of "absolute rest." On Oct. 24th an intramuscular injection of salvarsan, 0·4 gramme, in the form of "joha" was given, but seemingly without much effect, the temperature continuing to rise to about 100° at night. Accordingly, on Nov. 13th a third intravenous injection of neosalvarsan (0·9 gramme) was given, although the Wassermann reaction had proved negative a week earlier. This injection was followed by a feeling of slight nausea and some headache, but the temperature shortly fell to 99°

d did not rise again above that height (see Chart).
Nov. 18th examination showed that the physical
ns in the chest had not materially changed as com-
red with those observed on admission. Nov. 22nd:
e cough was better, and the sputum less in amount. The
tient felt "very much better in himself." Dec. 5th: The
tient was allowed up for two hours. The temperature was
ll steady, but the cough was very troublesome. 19th: The
tient was allowed up for four hours, on the 25th for six
urs, and on the 30th for eight hours. On Jan. 1st, 1914,
e patient was allowed up all day. The temperature was
rmal and the cough slight. No other symptoms were com-
ained of. Pulse, 80; respiration, 20. The patient had
ined 9½ lb. since August 25th. The physical signs in
e chest were now much drier. The sputum, which during
e first week in November, 1913 (when first charted),
eraged 5 oz. a day, now only amounted to 2 oz. The
tient's voice was better but still hoarse, and some
pillomata were still visible in the interarytenoid space,
t smaller than they had been. On Jan. 5th the patient
ft the hospital to take up work as a park-keeper.

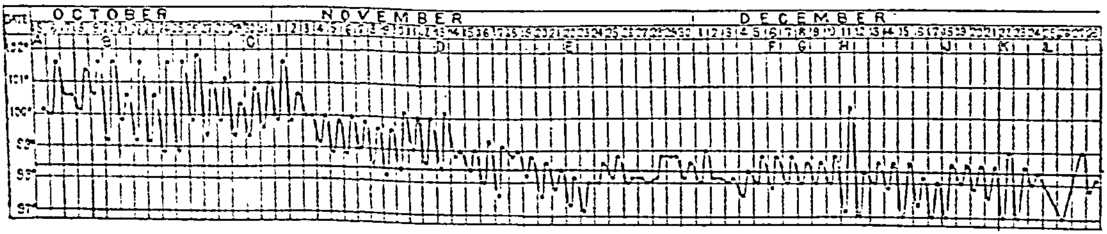
In this case the first and second intravenous
njections of neosalvarsan lowered the tempera-
ure and brought it for a short time to normal, but it soon rose again, and it was not until the third injection that final defervescence was effected. As the Wassermann reaction was now negative, the fever at this later period at any rate can hardly be attributed to the syphilitic infection.

FIG. 1.



Temperature chart of Case 1. A, Patient admitted on August 18th; B, first injection of neosalvarsan, 0·9 grm.; C, second injection of neosalvarsan, 0·9 grm.; D, patient placed upon absolute rest; E, third injection of neosalvarsan, 0·9 grm.

FIG. 2.



Temperature chart of Case 2. A, On admission; B, patient placed upon absolute rest; C, first injection of neosalvarsan, 0·9 grm.; D, second injection of neosalvarsan, 0·9 grm.; E, gradually taken off absolute rest; F, up for two hours; G, up for four hours; H, attack of indigestion and vomiting; J, up for six hours; K, up for eight hours; L, up all day.

CASE 2.—The patient, a male, aged 55 years, was admitted into Brompton Hospital on Oct. 15th, 1913, complaining of a cough of seven months' duration, considerable loss of weight, some night-sweating, and shortness of breath on the least exertion. The temperature was 100·2° F, rising to 101·6°; pulse, 80; and respirations, 20.

On examination the left lung was found to be infiltrated from apex to base, with signs of marked excavation in the upper lobe. The apex of the right lung and the apex of the right lower lobe were also infiltrated. Tubercle bacilli were present in the sputum. There was no history or evidence of syphilis.

The patient was placed upon absolute rest, but it appeared to have no effect, the temperature rising nightly to between 101° and 102° (see Chart). Oct. 30th: 0·9 gramme neosalvarsan was injected intravenously, this being followed by a feeling of general malaise but no other untoward symptom. The temperature remained raised for three days, but on Nov. 2nd it commenced to fall (see Chart). The patient now felt much better and stated that he felt "as if new blood had been put into him." The cough, which had formerly been exceedingly troublesome, was now greatly relieved. On auscultation the signs in the lungs were found to be somewhat drier.

On Nov. 13th, as the temperature, though lower, still touched 100° each night, a second injection of neosalvarsan (0·9 gramme) was given. The patient vomited two hours after the injection and the temperature rose to 100·2°. The following day he again vomited twice, but the temperature fell to 99° and did not rise again (see Chart). On the 17th the patient felt much better. 22nd: Temperature normal. The patient is being gradually taken off absolute rest. Dec. 6th: Up two hours. 8th: Up four hours. Cough and sputum less. Gaining weight. Signs in chest a little drier. 11th: Temperature rose to 100·5°, due to an attack of indigestion. 18th: Up six hours. 22nd: Up eight hours. 25th: Spent a very strenuous Christmas with no bad results. 30th: Up all day. On Jan. 9th, 1914, the patient left the hospital to go to a convalescent home. He had improved greatly in appearance as compared with his condition on admission, and felt much stronger. The cough was much diminished, and the sputum brought up during the past week amounted to 3½ oz. daily, as compared with 8 oz. at the commencement of November last. Tubercle bacilli could not now be found, even by the antiformin method. The physical signs in the chest had not altered much during his stay in the hospital, but were probably somewhat drier. He had gained 10½ lb. since admission.

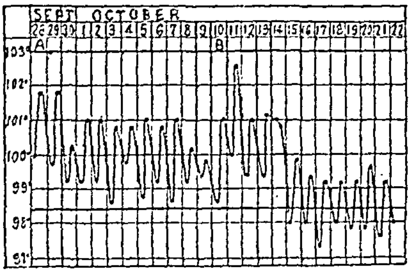
CASE 3.—The patient, a male, aged 42 years, was admitted into Brompton Hospital on Sept. 24th, 1913, suffering from cough of nine months' duration and pain on the left side of the chest. His temperature was remittent, never reaching the normal, and ranging to 101·8° F.; pulse, 100; and respirations, 24.

On examination the patient was found to be suffering from advanced phthisis, with extensive excavation in both upper lobes, also of the middle lobe, and of the upper third of both lower lobes. The remainder of both lower lobes showed evidence of infiltration. Tubercle bacilli were present in the sputum. There was no history or sign of syphilis.

The patient was placed upon absolute rest but apparently without any effect, the temperature still swinging to 101°

nightly, and not reaching normal in the morning (see Chart). Oct. 10th: 0·9 gramme neosalvarsan was injected intravenously. An hour later the patient had a rigor and vomited twice. 11th: The temperature rose to 102·6°. The patient vomited once. The temperature remained raised at its former level until Oct. 15th, on which day it came down, touching normal for the first time since admission, and afterwards did not rise above 99·5° (see Chart). 19th: The patient felt much better, and the chest was found to be drier on auscultation. On the 22nd the patient left the hospital at his own request. The temperature now ranged between 97·4° and 99·5°; pulse, 80; and respirations, 20. On Jan. 18th, 1914, his medical attendant wrote to say that the patient was doing well, and was quite able to come to the hospital at any time, but he could not be persuaded to present himself for examination.

FIG. 3.



Temperature chart of Case 3. A, Patient placed upon absolute rest; B, Injection of neosalvarsan, 0·9 grm.

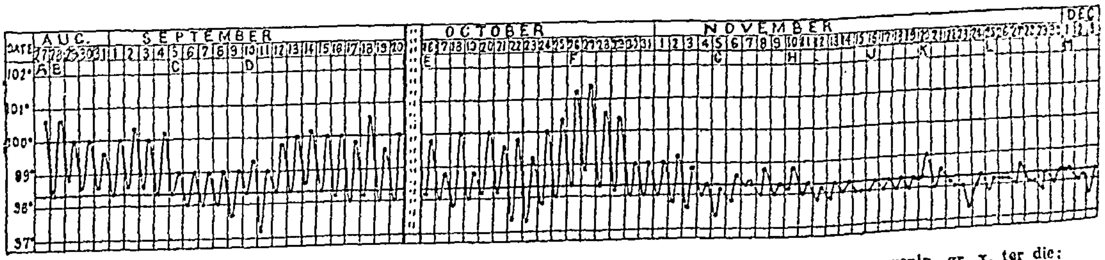
CASE 4.—The patient, a male, aged 22 years, was admitted into Brompton Hospital on August 27th, 1913, complaining of a cough of five months' duration, night-sweating, and considerable shortness of breath on exertion. The temperature was 100·6° F.; pulse, 88; and respirations, 24.

On examining the chest the patient was found to have extensive tuberculous disease affecting both lungs. The note was impaired over the right apex extending down to the second rib in front and to the midscapular region behind. Crepitations were heard over the impaired region in front. Over the left lung the note was impaired to the third rib in front, with signs of excavation and many moist sounds. Behind the note was impaired from above down to the level of the angle of the scapula, with signs of excavation in the supraspinous fossa, and also at the apex of the lower lobe. The patient's voice was husky, and there was considerable (tuberculous) infiltration over both arytenoid regions and in the aryepiglottic folds. Tubercle bacilli were present in the sputum. There was no history of syphilis or any sign pointing to this disease.

The patient was placed upon "absolute rest," but the temperature did not improve, rising at night to between 100° and 101°. On Sept. 5th cryogenin, in 10 grain doses, three times a day, was prescribed. This was continued until the 10th, and during its administration the temperature fell to normal (see Chart), but on its discontinuance the temperature rose again to its former height. From Sept. 21st to Oct. 16th fever was still present, the evening temperature varying between 99° and 101°, and from Oct. 16th onwards for the next ten days it still remained raised (see Chart). The physical signs in the chest had by now extended and moist sounds were heard over the whole of the left front and down to the base behind, the whole of the left lung being thus involved. Crepitations were also heard at the right apex posteriorly. The infiltration of the larynx, which had previously increased, was now somewhat less marked. On Oct. 26th neosalvarsan (0·9 gramme) was injected intravenously. This was followed by a feeling of general malaise for 36 hours, but there was no shivering or vomiting. For three days the temperature remained raised, but on the 30th it fell to 99° and soon to normal, after which it did not rise again (see Chart). Nov. 4th: The patient felt much better; the cough was less troublesome, and the sputum diminished in amount. No crepitations were heard at the right apex, but the physical signs were otherwise unchanged. Voice better; infiltration in larynx slightly diminished. 5th: Taken off absolute rest. 10th: Up two hours. 16th: Up four hours. A few moist sounds heard at the right apex. 20th: Up six hours. 25th: Up eight hours. Dec. 1st: Up all day. Pulse, 72; respirations, 20; temperature, 98·4°.

On Dec. 17th the patient was transferred to the Brompton Hospital Sanatorium at Frimley. His temperature was now normal, and he was up and about all day. He had gained 14½ lb. during his stay in the hospital. His cough did not trouble him, but he still brought up much phlegm, the amount for the past week being, however, 17½ oz. per diem, as compared with 22½ oz. for the week preceding the injection of neosalvarsan. The physical signs in the chest showed no further alteration, but shortly before leaving Dr. Dundas Grant noted that the infiltration of the larynx was less marked. The patient remained at Frimley from Dec. 17th to Jan. 28th, 1914, and on leaving was upon Grade II. of labour. He was unfortunate, however, in striking a spell of very cold and severe weather, which irritated his larynx and made his cough very troublesome. He therefore, at his own request, was allowed to return to his home in the country. The physical signs in the chest remained much as they had been noted in the middle of October, except that moist sounds were not now audible over the right apex posteriorly.

FIG. 4.



Temperature chart of Case 4. A, On admission; B, patient placed upon absolute rest; C, cryogenin, gr. x. ter die; D, cryogenin discontinued; E, patient still on absolute rest; F, injection of neosalvarsan, 0·9 grm.; G, patient taken off absolute rest; H, up for two hours; J, up for four hours; K, up for six hours; L, up for eight hours; M, up all day.

These cases show the marked effect upon the temperature which may sometimes be produced by the intravenous injection of neosalvarsan and the improvement which simultaneously results in the patient's general condition. The effect, as a rule, is not immediate, but shows itself after an interval of two or three days. The temperature then falls possibly to normal, where it may remain (Case 4). In other cases defervescence is not complete, and a second injection is required before it becomes normal (Case 2). In other cases a third injection may be required (Case 1). With the fall in temperature an improvement in the patient's general condition occurs which is sometimes very striking, and with this there is a lessening of the cough and a diminution in the amount of sputum. As regards physical signs these become somewhat drier, but otherwise no very marked alteration is usually observed.

Such striking results, however, as those seen in the above cases must not be expected in every instance. Of the 16 cases in which I have observed the effect of the drug, in one at least, that of a woman, aged 60, with extensive pulmonary tuberculosis, two injections of neosalvarsan were given seemingly without effect. In another the beneficial effect was only temporary, and after a time pyrexia returned, though milder in degree. In others improvement resulted and the temperature became normal, the fall being a gradual one in some cases, but it has been difficult always to decide how far the result was due to the drug and how far to the rest in bed and favourable surroundings to which phthisical patients may eventually respond even after a considerable period of pyrexia.

The drug, in short, is not a specific, but it would appear to have the power of influencing very favourably certain cases of active and febrile tuberculous disease of the lungs which have resisted other treatment, and it merits, therefore, a more extended trial. If administered with care and with due precautions it may be given apparently without risk even in very advanced and grave forms of the disease.

Devonshire-street, W.

TWO CASES OF SPRUE TREATED BY MOUTH STREPTOCOCCAL VACCINES AND EMETINE HYDROCHLORIDE HYPODERMICALLY.

BY LEONARD ROGERS, C.I.E., M.D. LOND.,
F.R.C.P. LOND., F.R.C.S. ENG.,
LIEUTENANT-COLONEL, INDIAN MEDICAL SERVICE; PROFESSOR OF PATHOLOGY AT THE MEDICAL COLLEGE, CALCUTTA.

IN the chapter on sprue in my work on dysenteries a series of 47 cases treated in the European General Hospital is analysed, and the conclusion arrived at that in only a very small proportion was even temporary benefit derived from prolonged treatment in a tropical climate, while in the great majority no improvement resulted from our present methods. I also mentioned that I had seen some good from small doses of ipecacuanha, and suggested a trial of emetine hydrochloride hypodermically. During the last few months I have had some opportunities of trying this treatment. In addition I administered a vaccine prepared from streptococci derived from the mouth ulcers, where they were found to be present in nearly pure culture. In the following two severe and chronic cases the results of this method of treatment have been so strikingly favourable as to appear to be worthy of record, as it may be a considerable time before I get any further opportunity of trying the same remedies.

CASE 1.—A Mahomedan woman, aged about 40, was sent over from Bombay to be under my treatment. The history of the case showed that in October, 1905, she had commenced passing a number of large light-coloured loose, frothy stools, said to be as many as 20 daily, and accompanied by obstinate dyspepsia. She was then a stout woman weighing 14 st., but her weight soon became reduced to 10 st. During the following year the diarrhœa was less, with only about five stools daily, but she was never free from it. In November, 1908, there was a recrudescence, with numerous loose stools, nausea, and flatulence. She stated that this condition had continued ever since, and that for the nine years before I saw her she had never been free from diarrhœa, although she had been treated by a number of medical men, both European and Indian, in Bombay and Calcutta. She lived in Bombay from June, 1911, to December, 1913, but was worse there than when in Calcutta. At that time she used occasionally to become giddy and even faint, having several times been found collapsed on the floor at night on her way back from the bathroom. During the 18 months she was in Bombay her gums were ulcerated and they bled freely, and she was told by a dentist that this condition could not be cured until all her teeth had been removed, which she declined to allow.

Present condition.—When I first saw the patient on Dec. 6th, 1913, she was passing about 12 large, loose, pale, sprue-like stools daily, accompanied by flatulent dyspepsia. I failed to find any amœbæ in the stools, but determined to try emetine injections for the reasons given in the opening paragraph of this paper. There was marked pyorrhœa alveolaris, so I made cultures, and obtained large numbers of streptococci, from which I made a vaccine.

Progress.—Half-grain doses of emetine hydrochloride were injected hypodermically every other day, and were soon increased to one-grain doses. After two or three injections, and before the vaccine had been commenced, the stools became much less frequent and of better consistency and colour. After eight injections the evacuations had become healthy and only one or two a day. In the meantime the streptococcal vaccine was begun, 50,000,000 soon increased to 100,000,000, being injected once a week. The discharge of pus from the gums rapidly decreased, and in a few weeks completely disappeared, and has remained absent for the last four months. No teeth were removed. Some superficial soreness and redness of the tongue subsequently appeared, from which a streptococcus was also cultivated. A vaccine made from this removed the unhealthy condition of the tongue within a few days.

I saw the patient on May 3rd last, and, except for slight redness of the tip of the tongue, she was quite well almost five months since the diarrhœa ceased, after having been continuously present for nine years before the new treatment was commenced. She has no dyspeptic symptoms, and can digest all ordinary food. She is now free from the giddiness, faintness, and neuralgia which she used to suffer from, and her general health has greatly improved. She has not been weighed regularly, but has put on some flesh and has gained much in strength. The only trouble with her bowels is a slight tendency to constipation, necessitating an occasional dose of castor oil.

CASE 2.—A woman, aged about 40, came under my care, in consultation with Dr. C. H. Elmes, in December, 1913, in an advanced stage of sprue of four years' duration. The previous history is a long one, but the principal points are given in the following chronological account:—1909: August to November, very severe diarrhœa on and off in Calcutta. Went to England and into a nursing home, and was later sent on a long sea voyage to Hong-Kong. 1910: January, in Peak Hospital, Hong-Kong, where the disease was diagnosed as sprue. Returned to Calcutta at the end of January and got much worse. Rapidly lost weight from 13½ st. to 10½ st. Returned to Hong-Kong in April, and remained in hospital there for six months, at the end of which she had lost another stone in weight during a severe relapse. Then went to England, and lost her diarrhœa on the voyage. 1911: Returned to Calcutta and again became affected with sprue. April to August, voyage to Japan and back. Returned stronger and heavier and free from sprue. Relapsed a week after return to Calcutta, but improved much during five weeks in the General Hospital. 1912: March to August, trip to Japan. No diarrhœa, and put on nearly a stone in weight. Returned to Calcutta in September and had another very severe relapse, lasting to February, 1913. 1913: In February left again for Japan. The diarrhœa at first stopped on the voyage, but later very severe relapse, with 10 to 14 stools daily, following a chill. The mouth was especially bad in this attack, and remained most painful for 10 months. She now went to Berlin for treatment and improved considerably. In August she went to London and again relapsed. From August to November she was under the care of specialists on tropical diseases in nursing homes and at her house, but got steadily worse, her weight now falling to 7 st. 5 lb., although a tall, heavily built woman whose former weight was 13½ st. In November left for India. The diarrhœa continued to be severe on the voyage, while she also suffered from chyluria, after the onset of which the diarrhœa became somewhat less. The feet had now become swollen, and her general condition was very unfavourable.

Present condition.—I first saw the patient on Dec. 17th,

1913. She was then in a very emaciated and weak condition, and passing several large, pale, typical sprue stools daily. Emetine hydrochloride was given in half-grain doses two or three times a week, and later increased to one-grain doses. She slowly improved during the next three weeks, but on Jan. 14th last she had a severe relapse with frequent copious stools. Her mouth had now become very painful, with numerous small shallow ulcers on the tongue and buccal mucous membrane, while the temperature rose every afternoon for about a week. She was very prostrated and too weak to stand or even sit up, while the pulse was fast and irregular. I now made cultures from the mouth ulcers, and obtained in some of the tubes a pure growth of a streptococcus. I therefore made a vaccine from it and commenced with 50,000,000, increased later to 100,000,000, once a week. After the second dose of the vaccine both the mouth and the bowel symptoms rapidly improved. Towards the end of January she was put on a milk diet by another physician during my temporary absence from Calcutta, beginning with 6 oz. and gradually increasing it to 120 oz. daily by the end of three weeks. The emetine injections were continued twice a week. The diarrhœa now stopped, the mouth lesions healed, the vaccine being continued once a week. Up to this time the patient was being carried from her bed to a couch for a few hours daily. She now rapidly improved, and on March 4th was able to be moved to Bangalore, a three days' railway journey, for the hot weather.

On March 20th the patient reported that she had had no sign of diarrhœa since Feb. 5th. The mouth was quite well. She had gained just over a stone in weight in four weeks, before which she had become reduced to 6 st. 9 lb., or to under half her original weight. She was now able to walk a quarter of a mile and do everything for herself. She was continuing the vaccine once every eight days and the emetine injections once in ten days. On April 9th she reported continued improvement. She could now digest eggs, semolina, and toast-and-butter. I last heard from her on April 28th, when she remained free from all signs of sprue and continued to gain weight steadily.

Although it is too early to draw final conclusions from the above two cases, yet, in view of the very unsatisfactory results of other forms of treatment in Calcutta (including that by yellow santonin), the rapid and great improvement in two successive severe and very chronic cases is not a little remarkable. In the first case the improvement certainly commenced as soon as the emetine injections were begun, and before the mouth streptococcal vaccine was administered. Nevertheless, I am inclined to attribute much of the ultimate success to the vaccine. In the second case a relapse occurred after improvement had followed the emetine injections, and it was not until the mouth condition had been improved by two doses of the streptococcal vaccine that rapid and continued improvement of the stools set in. I think the milk diet was also of undoubted service in this case, although it was not found to be necessary with the first patient. I do not look on emetine as in any way a specific in sprue, such as it undoubtedly is in amœbic dysentery and hepatitis, but I am inclined to regard it of some value in certain cases of the disease. We should bear in mind that "sprue" is a purely clinical term, and there may be more than one causative agent, just as in the case of "dysentery."

The success attending the use of a vaccine made from the streptococci which were found present in practically pure culture in the mouth lesions is very significant, and opens up the interesting and suggestive question as to whether this class of organism may not be the cause of the disease, at least in some cases. The rapidity with which the disappearance of mouth ulcers under the influence of the vaccine was in the second case followed by cessation of the diarrhœa certainly suggests a causal relationship between the organism and the disease, and affords some hope of the new treatment proving to be of a specific nature and thus an important advance in dealing with this intractable and distressing disease. Even in cases where no mouth lesions are present there may still be a streptococcal infection of the digestive tract, and possibly cultures may be obtainable from the stools which might prove of service in the form of a vaccine. At any rate, it appears to be advisable to put these two cases on record without delay, if only to stimulate research on the lines I have indicated.

Calcutta.

CONGENITAL DEFICIENCY OF THE RADIUS AND A HOMOLOGOUS CONDITION IN THE LEG.

BY JOHN FRASER, M.D., M.CH. EDIN., F.R.C.S. EDIN.,
ASSISTANT SURGEON, ROYAL HOSPITAL FOR SICK CHILDREN, EDINBURGH;
AND
H. H. ROBARTS, M.D., CH.B. EDIN., D.P.H. F.P.S. GLASG.,
FORMERLY RESIDENT MEDICAL OFFICER, ROYAL HOSPITAL FOR SICK CHILDREN, EDINBURGH.

CASES illustrative of these conditions have lately been brought to our notice, and their occurrence is sufficiently rare to warrant their publication.

Club-hand.

Case history.—The patient was a child aged 2 months. An interesting feature was noticed during the birth which may throw some light on the etiology of the condition. At birth the hand of the affected side was tucked into the axilla, the upper arm being close to the side and the elbow- and wrist-joints flexed. In this position the hand was deviated towards the radial side. The child throve well after birth. The errors in development and position of the hand and forearm were at once noticed; no other congenital error was discovered. With the progressive growth of the child the deformity of the hand and arm became more manifest.

Etiology.—Several theories have been mooted to explain the occurrence of the abnormality. Their discussion must be premised by an outline of the development of the extremities.

Development.—The extremities make their appearance as little rounded buds springing from the lateral aspect of the trunk at the junction of its dorsal and ventral aspects. The buds are visible at the end of the third or the beginning of the fourth week. As they grow out they become flattened, so as to present surfaces which lie parellel to the vertical antero-posterior plane of the trunk. The flattened bud at the end of the fifth week presents a constriction which subdivides the whole into a hand plate and an arm plate. At the circumference of the hand plate there is a thickened border—the digital pad. From this pad, by an irregular growth, the thumb and the fingers are formed. At first the upper and lower extremities are placed symmetrically, their future extensor aspect lying dorsal, and the flexor aspect ventral. At the commencement of the third month both extremities undergo a rotation in opposite directions, so that the elbow is brought to the back, while the knee is brought to the front. It therefore follows that the tibia corresponds to the radius, while the ulna corresponds to the fibula.

Gegenbauer's theory.[1]—Gegenbauer believes that the development of the arm is arranged on the plan of the primitive fin, as a stem and four independent rays. The first ray is composed of the radio-scaphoid, the trapezium, the first metacarpal bone, and two phalanges. The bony defect is the result of a suppression in order from above downwards of one or more rays.

---

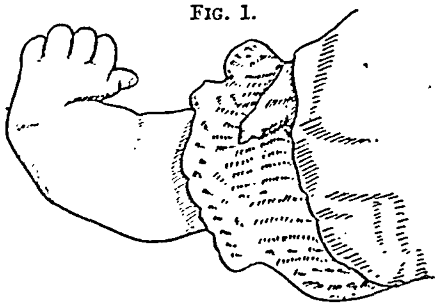
[1] Transactions of the American Orthopedic Association, vol. x., p. 174, 1897.

The mechanical theory.[2]—This theory ascribes the condition to pressure of the amnion and deficiency of fluid at the time of development of the arms. Now, the radius is the homologue of the tibia, and if one assumes that Gegenbauer's theory is correct, one would naturally expect that a deficient tibia would be more commonly met with than a deficient fibula. In actual fact the reverse is the case, and the fibula is more often deficient than the tibia. This apparent incompatibility has given popularity to the mechanical theory.

Authors' theory.—One of us (H. H. R.) has lately delivered two children suffering from this deformity, and in both instances it was noticed that the hand was firmly fixed in the axilla, with the upper arm close to the side, and the elbow flexed. The position of the hand in the axilla was such that it was deviated strongly towards the radial side. With the hand so fixed it is easy to appreciate the influence which the posture must have on the development of the deformity.

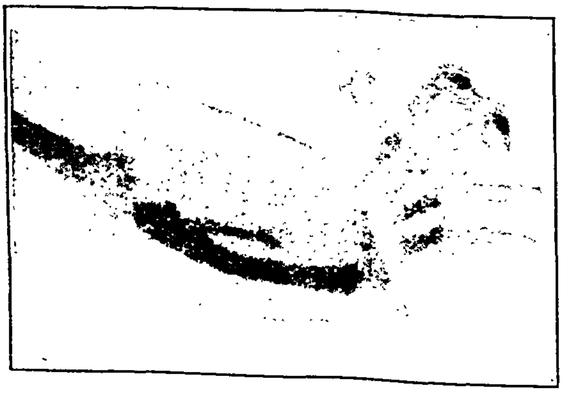
Pathology.—The radius was not completely absent; it was represented by a thin, rod-like portion of bone, about 1¼ inch long, occupying a position opposite the middle third of the ulna. The ulna was slightly bent, convex inwards. Its articulation with the humerus appeared to be healthy. There were four metacarpal bones, the metacarpal bone of the thumb being absent (see Figs. 1 and 2). The phalanges of the fingers and of the thumb were present. No ossification had appeared in any of the bones of the carpus nor in any of the epiphyses of the part. From an examination of the soft parts one concluded that the radial extensors and supinators were wanting, while the muscles of the thumb were either absent or deficient. There were no other congenital defects apparent.

FIG. 1.



Congenital deficiency of left radius.

FIG. 2.



Radiograph of the bones, showing a congenital deficiency of the radius and absence of the metacarpal bone of the thumb.

Treatment.—Numerous manœuvres have been adopted with a view to correcting this exceedingly debilitating condition. The resistant structures on the inner side of the arm have been divided, and the correction maintained by means of splints. The resistant structures may include the ulna.

Sayre and Park[3] excise one or more of the carpal bones and insert the end of the ulna into the cavity which is left. Bardenheuer recommends a splitting of the ulna into two halves, a radial and an ulnar. The carpal bones are wedged between the distal ends of the ulna, and fixed in such a position; ankylosis inevitably follows. McCurdy[4] divides the ulna at such a level that the free end of the upper fragment can be brought to the semilunar bone. In exposing the bone the soft parts are divided obliquely, the purpose being to allow the soft parts to be slid one on the other and so to be lengthened rather than divided. The semilunar bone and the end of the ulna are drilled and coapted with sutures. Antonelli supplies a new radius by splitting the thickened ulna almost from end to end. Muscles are interposed between the separated halves of the bone, and the lower end of the new radius is sutured to the end of the ulna and to the carpus with silver wire. Shortened structures are lengthened, and division is carefully avoided.

We propose an operation which we have adopted with complete success in the corresponding condition of the foot—congenital deficiency of the tibia. The procedure is fully described later; it consists in resection of a portion of the fibula, sufficient to overcome the deformity, and the implantation of a new radius, by introducing the fibula to fill up the deficiency.

Congenital Deficiency of the Tibia.

Case history.—The patient was a female infant who came under our care when 6 weeks old. There was found to be an obvious congenital error in the development of the bones of the right leg; the foot and the lower fourth of the leg were set inwards at right angles to the true axis of the limb. Palpation revealed the fact that the lower end of the tibia was imperfectly developed and the growing fibula had displaced the foot inwards. There were no other congenital errors.

Etiology.—It has been pointed out that the tibia is the homologue of the radius, and therefore the developmental theory applies in this instance. The position of the foot and limb at once suggested that improper pressure was the cause of the deformity. Unfortunately, no details could be obtained regarding the birth history, but on the outer aspect of the foot there was, in the form of scars, distinct evidence that pressure on the outer aspect of the foot had been exerted at some period of intra-uterine life. The crossed position of the limbs in utero renders the pressure theory a very likely one.

Pathology.—There was a distinct deficiency in the lower third of the tibia. About the centre the shaft terminated in a cup-like covering of fibro-cartilage. The lower epiphysis was present, an on the epiphyseal cartilage there was a remnant of the diaphysis in the shape of a small pyramidal mass. This mass was largely cartilaginous, and from its apex a band of fibrous tissue extended upwards to the cap-like covering of the end of the shaft. The appearances of the deficient tibia were suggestive of pressure having been the etiological factor. The fibula was bent inwards at the junction of its lower and middle thirds. At the situation of the bend the bone was almost completely cartilaginous. As far as could be ascertained the ankle-joint, tarsus, and metatarsus were healthy. The soft structures on the inner side of the foot were shortened, none appeared to be absent.

---

[4] Annals of Surgery, 1906, p. 43.

Treatment.—Possibilities of treatment were discussed, such as have been mentioned in speaking of the arm. It was decided to attempt a transplantation of the fibula from the opposite leg, and the operation was followed by complete success. The operation was done when the child was six months old. From the limb of the opposite side a portion of fibula was removed from the centre of the shaft of the bone. The length removed was sufficient to fill up the gap necessarily left in the deformed tibia. A subperiosteal excision was performed and the bone was kept in warm sterile saline until required. An incision was made over the deformed fibula to expose the angle of the bend. Sufficient bone was removed to permit of straightening of the foot, and the cut edges were united with sutures of silver wire. A second incision was made along the line of the tibia—it thoroughly exposed the deficiency in the bone. The shaft was divided above and below, so as to expose healthy bone tissue, and all intervening fibrous and cartilaginous elements were removed. Into the gap so formed the fibula, which had been removed from the opposite limb, was implanted. Its length was slightly greater than the gap, so that its insertion tended to produce some over-correction of the deformity. The implanted fibula was fastened at each extremity by sutures of silver wire, above to the remains of the diaphysis, below to the epiphysis. The wounds healed by first intention, and when the stitches had been removed, the limb was encased in plaster-of-Paris. The plaster case was changed at intervals of three months, and remained in position for a total period of six months. It is now nine months since the operation was performed. The limb is perfectly straight, and the child is walking. The precaution is being taken of having the outer sole of the boot raised, in order to maintain, when walking, a correction of the deformity.

THE UNIVERSITY OF BRISTOL AND EXPERIMENTS ON ANIMALS.—At its last meeting the council of the University considered a recommendation received from the Senate to the effect that the restriction which has hitherto confined animal experiments to diagnostic inoculations in suspected plague should be now removed. It was reported that those restrictions did not exist in the other modern universities, and a resolution was passed enacting the following standing order in the stead of the old one: "No experiments on living animals other than inoculations and feeding experiments shall be conducted in the University except under anæsthesia, and any animal operated on for the purpose of demonstration shall be killed while still completely anæsthetised." At the annual meeting of the local branch of the Research Defence Society this decision was received with satisfaction, and it was also reported that the number of members and associates had grown from 88 to 103 in the past 12 months. The reading of the annual report was followed by an interesting address by Mr. E. W. Hey Groves on Sentiment and Reason in Relation to Medical Research.

Clinical Notes:

MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL.

A CASE OF APPENDICITIS SIMULATING INTUSSUSCEPTION.

BY ROBERT E. HALAHAN, M.D. DUB.,
SURGEON, BRITISH HOSPITAL, BUENOS AIRES.

ON a Wednesday evening I was called to see a little girl, 5 years of age. She had just had a rigor, accompanied by headache, vomiting, diarrhœa, and a good deal of pain in the epigastrium. Her temperature was only 37·2°. The abdomen was quite soft, nothing could be felt, and there was no pain, tenderness, or resistance over the appendicular region. She was ordered some calomel, and the next day felt very much better—no vomiting, no headache or temperature, and, except for a few colicky pains occasionally in the abdomen, she seemed quite well.

On Friday the pains were rather more severe, situated in the upper abdomen; she had vomited once and her bowels had not moved. The next day the pains had still increased, making the child cry out from time to time. The abdomen continued soft, and the most painstaking search failed to reveal even a point of resistance. The bowels did not move.

On Sunday morning she felt very much better, the pains having almost gone; but in the evening I was sent for in a great hurry, as the child was vomiting continuously, and after an enema she passed some blood and mucus. Her temperature was normal, but she had very severe attacks of pain in the abdomen, causing her to cry aloud. The pulse was 120 per minute, the tongue dirty and very dry. Under the lower border of the liver a transversely placed tumour could be distinctly felt.

In view of the character of the pain, the constipation, the presence of a distinct and sausage-shaped tumour, the passage of blood and mucus, the absence of fever, and continuous vomiting, there seemed to be no doubt as to the nature of the complaint. I diagnosed an intussusception and advised immediate operation. On opening the abdomen, which was done through the right rectus, an enormous appendix, 14 centimetres long and twice the normal diameter, was found lying just below the lower border of the liver. There was no intussusception, and after excision of the appendix the child made an uninterrupted recovery.

Buenos Aires.

NOTE ON A CASE OF DEATH FOLLOWING THE STING OF A SCORPION.

BY R. McC. LINNELL, L.R.C.P., D.P.H. CAMB.,
D.T.M. & H. CAMB.,
MEDICAL OFFICER TO THE KUALA LUMPUR RUBBER COMPANY,
FEDERATED MALAY STATES.

THE following case may prove of interest to readers of THE LANCET in view of the fact that it is unusual for a scorpion sting to prove speedily fatal.

The patient, a coolie aged 20, was admitted to the Kent Estate Central Hospital, Kuala Lumpur, on Jan. 25th, 1914. He had been working regularly until two days previously, when he was stung by a scorpion in the left heel. For the cure of the sting the other coolies had made him eat the head of the scorpion. On admission to hospital the patient complained of "things creeping all over the body." The temperature was 102·8° F. No malarial parasites were found. A blood count gave the following percentages: Polymorphonuclears, 75·8; mononuclears, 0·81; lymphocytes, 9·68; transitionals, 5·64; mast cells, 0·81; and eosinophiles, 7·26. The heart and lungs were clear and the urine was normal, but the fæces contained ankylostoma ova. On the fourth day after receiving the sting the patient had paralysis of the legs, and on the fifth day motor paralysis to the umbilicus, sensation being unaltered. On the sixth day there was retention of urine, and on the ninth day sugar was present in the urine (between the third and ninth days the urine was not examined). On the thirteenth day the patient became comatose, but could be roused to eat and drink. The temperature on the following day fell below 95°, and the patient was still comatose. Death intervened on the fifteenth day.

The patient had seemed to be able to feel as long as he was conscious. The sugar had persisted in the urine from the ninth day to the end. The patient's relatives had very strong objections to a *post-mortem* examination being held, but I finally persuaded them to allow me to remove a piece of the spinal cord. Dr. W. Fletcher, pathologist to the Institute of Medical Research, Kuala Lumpur, kindly examined this and reported as follows:—

> A portion of the lumbar cord was received for examination. It had been hardened in alcohol, so that no pathological changes could be recognised in the myelin sheaths. Paraffin sections stained with Haidenhain showed that the cord was affected with acute disseminated myelitis. In one part there was an acute destruction of the anterior horn and an infiltration of round cells. In another portion Clarke's column had been destroyed. The perivascular sheaths were crowded with small round cells and the meninges were congested. Some of the cells of the anterior horn were swollen and the nuclei eccentric; chromatolysis had occurred in many of them.

Although scorpion stings are fairly common in the Federated Malay States, yet deaths following them directly must be, as I have already intimated, extremely rare, the above case being the only one which I can trace. The scorpion was a small brown specimen, which the natives declare to be the most vicious and deadly of all. What appears to be an unusual feature in the case was, I may add, the appearance of sugar in the urine.

Kuala Lumpur.

SCHOOL MEDICAL SERVICE IN *BRISTOL*.—A local medical correspondent writes as follows:—At a recent meeting the Bristol city council adopted the recommendations of their education committee in relation to the school medical service. Briefly, this establishes a rather larger and more extensive service than has sufficed hitherto in order that the new regulations of the Board of Education, insisting on examination of children at intermediate as well as at entering and leaving ages, may be carried out. The present staff consists of a part-time medical officer with several assistant part-time medical officers and two school nurses. The part-time officer is to give place to a whole-time officer, the assistants are to be retained, and there are to be four school nurses instead of two. Moreover, several clinics are to be established in which instruction as to the treatment of minor ailments will be given to parents. The salary of the whole-time officer is to be £500. It is not known as yet how these proposals will be received by the existing staff, but it is certain that the continuance of the part-time assistant officers is of benefit to the city, since it makes for sanity and breadth of outlook to have the inspection done, at least in part, by men who are in general practice.

Medical Societies.

ROYAL SOCIETY OF MEDICINE.

MEETING OF FELLOWS.

Demonstration on the Cultivation of Human and Other Tissues in Vitro.

A MEETING of Fellows was held on May 11th.

Dr. DAVID THOMSON gave a microscopic and lantern demonstration on the Cultivation of Human and Other Tissues in Vitro. The research was carried out in conjunction with Dr. JOHN GORDON THOMSON (Beit Memorial Research Fellow) in the Marcus Beck Laboratory in that institution under the directorship of Sir Ronald Ross, and as the work represented the first-fruits of this new laboratory the author made a brief reference to the memory of Marcus Beck, and expressed his thanks to Sir Francis Champneys, the President, the Council, and Mr. J. Y. W. MacAlister, secretary of the society, for the facilities which they had given him. The tissues were cultivated according to the technique employed by Carrel at the Rockefeller Institute. The tissue of embryonic chicks obtained from hatching eggs was largely employed, and also human tissue obtained from operations performed by Sir John Bland-Sutton at the Middlesex Hospital. It was found that when a small portion of embryonic chick tissue was implanted in a medium composed of the blood plasma of a fowl one part and extract of chick embryo one part the new growth radiated out from the original tissue on every side, without any tendency to produce a definite shape or structure. The original cells were for the most part round cells, but the new cells produced in this medium were as a rule elongated and tended to branch, so that the new tissue differed markedly from the appearance of the original material. In spite of this common characteristic it was noticed, however, that the types of growth produced from various species of tissue differed from each other. Connective tissue produced a radiating outgrowth of long, thin, branching cells, whereas the new growth from epithelial tissue was more of the nature of a solid extension of flat cells which did not elongate or branch so much as in the case of connective tissue. Brain tissue produced long axis cylinders, and the tissue of spleen and bone marrow produced large numbers of amœboid leucocytes of various kinds and also red blood cells. The tendency to elongation and branching of the cells of the new growth appears to be due to the solid or jelly-like consistence of the medium. In a liquid medium composed of white of egg or a mixture of serum and plasma the cells of the new growth remain round like those of the original tissue. Growth *en masse* of definite shape or somatic growth *in vitro* was also obtained by placing a very young chick embryo (24 hours old) in the plasma medium. It was found that this embryo increased in size, while retaining its definite shape. If the toe of a young embryonic chick was placed in this medium it increased markedly in size, while it also retained its original shape. At the part, however, where the toe had been cut off (injured) the usual radiating uncontrolled growth was produced, but no such uncontrolled growth occurred from the uninjured surface of the tissue mass. With regard to the cultivation of human normal and tumour tissue, it was found that successful growth could be obtained in a medium composed of blood plasma of a fowl one part and extract of chick embryo one part. This was an interesting fact, since it showed that human tissue could grow in material obtained entirely from a bird. Small portions of two human tumours were successfully grown in this medium. (*a*) Intracystic papilloma of the ovary (not truly malignant). This was a very soft, friable tumour composed almost entirely of epithelial cells, and the new growth consisted of buds of pure epithelium. (*b*) Carcinomatous lymphatic gland. This tumour was somewhat tough, due to the presence of a considerable amount of connective tissue stroma, and the new growth which occurred comprised both these tissues. The connective tissue cells grew first after 44 hours' incubation and buds of epithelial cancer cells appeared later, after about three days' incubation, the growth continued in the same medium for 14 days, after which it ceased to show a further increase. The new growing tumour cells were in all cases much larger than the cells of the original tissue from which they sprang. They also contained numerous highly refractile granules, and were markedly amœboid and tended to throw out long protoplasmic processes into the medium. The growing tissue tended to liquefy this medium, more especially the solid outgrowth of epithelial cells. Human connective tissue would appear to grow more rapidly than specialised epithelial tissue. Human and other mammalian tissue grew much more slowly *in vitro* than embryonic chick tissue. The former showed little or no growth till about the end of the third day, whereas the latter showed a copious growth after 24 hours. The tissues in all cases were incubated at 37·5° C. The demonstration was followed by a micro-kinematographic film showing growth *in vitro* taking place from the cardiac and splenic tissue of an embryonic chick. The film was shown by Dr. H. D. MCCULLOCH, who had kindly obtained it on loan from Dr. Comandon, Pathe Frères, Paris.

SECTION OF MEDICINE.

On the Murmurs in Dilated Heart and their Explanation.—Leukæmia and X Rays.

A MEETING of this section was held on May 26th, Dr. SAMUEL WEST, the President, being in the chair.

The PRESIDENT read a paper on the Murmurs in Dilated Heart and their Explanation. He said that dilatation of the heart was a common condition and easily recognised. Murmurs were often associated with it, and as these murmurs came and went with it they might properly be called dilatation murmurs. As to how they were produced opinions differed. Murmurs were audible eddies; a so-called jet produced violent eddies. 1. In the vessel the conditions which led to eddies and murmurs fell into two groups according as the blood was passing (*A*) into or out of a dilatation of the vessel; or (*B*) through a constriction in it. Their force varied with the force of the circulation. *A*. (*a*) Mimic aneurysms was the simplest form—i.e., a transient dilatation of the aorta. This was met with in the subclavian and carotid and in the abdomen as "the pulsating aorta," which was often diagnosed as an abdominal aneurysm. (*b*) The true fusiform aneurysm yielded a similar condition, the dilatation being, however, permanent. (*c*) With saccular aneurysms the murmurs varied according to the relation in which the sac stood to the vessel. If it were a pouch at the side, or if the walls of the sac were rigid or its cavity filled with clot, the blood might not enter with sufficient force to give rise to eddies and then no murmur would be present. *B*. A vessel might be constricted (*a*) by pressure from without—by the stethoscope, for instance—or by a tumour; (*b*) by relative constriction, where the vessel passed through a fibrous membrane—e.g. the jugular vein in the supraclavicular fossa; or (*c*) by disease of its walls. 2. Many of these conditions were reproduced in the heart, especially when there was organic disease, but the only class he wished to discuss was that where organic disease was absent and only dilatation present. Dilatation murmurs in the heart might be present at the base or over the ventricle, and might be described as basic or ventricular respectively, and in each case might occur on the right or left side. A. *Basic murmurs* were often described as hæmic or functional, both undesirable terms. 1. At the left base the murmurs were called pulmonary. If produced in the pulmonary artery they might be due to the eddies caused by the blood passing through the normal orifice into a dilated artery above or more probably out of the dilated right ventricle behind, but it was also possible that they were sometimes due to a dilated left auricle pressing on the pulmonary artery from without. 2. At the right base there was a peculiar systolic murmur over the aorta heard under nervous excitement which might be diagnosed as due to aortic disease. It was transient and, he thought, probably due to dilatation similar to the condition above described as mimic aneurysm. B. The ventricular dilatation murmurs were almost always systolic in time, soft and blowing in character, limited to the precordial area, and only rarely propagated into the axilla and behind. They were commonly referred to regurgitation through the auriculo-ventricular orifices. The muscle-bundles wrapped round the auriculo-ventricular rings in figure-of-eight fashion. Their contraction led to narrowing of these orifices. Ludwig and Hasse showed this contraction by experiment, but they went further and said that without this contraction of the orifices the valve in health would not be competent, so that muscular weakness would cause auriculo-ventricular incompetence. It was *a priori* improbable that the heart should have such scanty reserves. The conclusion was opposed to post-mortem observation, where it had been frequently shown that the valves were competent to hold water even when the heart and the auriculo-ventricular rings were much dilated. If these murmurs were regurgitant they should be propagated as the regurgitant murmurs due to organic disease were. If they were not they could not be regurgitant. 1. (*a*) On the left side the murmurs of mitral regurgitation were as a rule propagated to the axilla and behind; the murmurs of dilatation as a rule were not. Some, however, might be when dilatation was extreme, and these might be fairly regarded as due to regurgitation, but the others could not be. If, then, not due to regurgitation, they must be produced by eddies in the dilated ventricle. (*b*) Another instance of murmurs produced in a dilated left ventricle occurred with aortic regurgitation. Then a very characteristic churning or almost continuous murmur was heard at the apex and thereabout. One variety of this had been called Flint's murmur, which, however, did not deserve a special name. (*c*) At the left base murmurs might be heard with organic mitral regurgitation, which might suggest aortic disease, but these were produced in the dilated left auricle. 2. The ventricular murmurs on the right side when due to tricuspid disease were propagated across the sternum to the right and were very characteristic. Those of dilatation were localised and not so propagated. Tricuspid regurgitation was often diagnosed on theoretical grounds even when there was no murmur at all. This could not be justified. These ventricular murmurs associated with dilatation therefore, whether on the right side or the left, were, he maintained, for the reasons given, not due to regurgitation through the auriculo-ventricular rings, but were intraventricular.—Dr. A. F. VOELCKER said that he also had been in the habit of naming these murmurs "dilatation murmurs." He thought there was still much to learn as to their etiology, and contended that there was no evidence that an eddy could produce a murmur. If it did so presumably it was by causing vibration of the cardiac wall. He spoke of the great frequency of apical systolic murmurs in children suffering from any acute illness. They were often conducted to the left, up the sternal margin, and to the pulmonary area, though not usually in children heard with greatest intensity over the last area. He had always considered that they were best explained by dilatation of a ventricle, but of the right, not of the left.—Dr. ALEXANDER MORISON said that one occasionally met with cases in which, in association with conditions of debility, apical murmurs were heard which were rough and propagated round the left side of the thorax to the back. The mechanism in such could scarcely be otherwise than a forcible regurgitation through the mitral orifice. It depended upon acute dilatation, which might pass off or terminate fatally. He thought the conductivity of murmurs depended largely upon their tone and intensity. He regarded the apical murmurs described by the President as due to actual regurgitation. The aortic systolic murmur referred to he considered was brought about by dilation of the left ventricle and relative stenosis of the aorta. There was too great a tendency at present to negative the importance of apical murmurs in young people.—Dr. W. BEZLY THORNE said he had been in the habit of calling such murmurs postural. They were curable, but not accompaniments of healthy hearts. They should not be made light of, but, on the other hand, one should hold before oneself in such cases the probability of their cure.—Dr. F. PARKES WEBER drew attention to a murmur sometimes heard about one ear and synchronising with the arterial pulse. The condition was sometimes known as "pulsating tinnitus." By an otoscope the murmur could be heard by an observer. It occasioned severe mental worry to the patient. It was scarcely ever due to an aneurysm, and disappeared.

Dr. J. MICHELL CLARKE read a paper on the Pathological Changes in a Case of Leukæmia from prolonged use of X rays. The patient, a middle-aged woman, was under observation more or less continuously from 1908 to 1913, when she died. For nearly four years of this time she was treated during long periods by X rays; at first the spleen only was rayed, later the bones as well. During the first two and a half years this treatment was remarkably successful; she was able to work and the condition returned nearly to the normal. Beyond some pigmentation there were no cutaneous lesions. The spleen, at first extremely large, reaching to the iliac crest, gradually diminished and became small and hard. At the end of 1911 the liver began to enlarge and slowly increased in size until in 1913 it was of enormous size, almost filling the abdomen. There was no ascites until just before the end. After 1911 the X rays seemed to lose their effect in keeping the disease in check. She died in July, 1913, from toxæmia associated with hectic temperature, extreme prostration, emaciation, and hæmorrhages from the gums. Tables giving blood-counts during the illness were shown. In the last phase of the illness the number of white cells in the blood was about 2,000,000 per c.mm. Post mortem the most remarkable feature was the enormous size of the liver, which was firm, and mottled pink and yellow. The spleen was about the normal size, extremely hard and tough, and on section glistening, like hard wax. The peritoneum was studded over with firm, pale, miliary nodules. The lungs and kidneys showed leukæmic nodules, and the mediastinal, post-peritoneal, and mesenteric glands were enlarged, grey, firm, and pigmented. There was no evidence of tuberculosis. On microscopical examination the chief changes were great increase of fibroid tissue, with in places hyaline degeneration, in spleen and lymph glands together with destruction of proper lymphoid tissue and presence of myeloid cells. In the hæmolymph glands there were a number of cells of large lymphocyte type. In the liver there was an enormous intralobular accumulation of myeloid cells and tissue. In neither this organ nor in the marrow was there any decided increase of fibroid tissue. The marrow was packed with myelocytes. Infiltrations of myeloid cells were abundant in the other organs. The above changes showed that the essential leukæmic process continues under X ray treatment; though it is checked for a time, it proceeds to a fatal termination, X rays seeming to lose their effect after a period of time varying in each case. Meanwhile, amelioration, often for considerable periods, and prolongation of life under less discomfort resulted from the treatment. Interesting points in this case were the gradual contraction of the spleen and fibrosis of it to an extent which must have rendered it useless, and with this the gradual and finally enormous size of the liver, which appeared to take the place of the spleen as a repository to intercept and retain the immense number of myeloid cells formed in the marrow. The beneficial effects of X rays in leukæmia seemed to be chiefly, if not entirely, due to the extensive destruction by them of the abnormal cells in the spleen, glands, and marrow; after a time they either lost this power or were unable to cope with the number of cells formed. Warthin thought that in addition to the above they might inhibit the leukæmic process in the marrow. The effect of X rays would thus support the view, now generally accepted, that the disease was primarily and essentially one of the marrow and that the splenomegaly and glandular changes were secondary and subsidiary.—Dr. PARKES WEBER regarded the changes in the liver as indicative of a myelocytic reaction. He drew attention to the varieties of anæmia found in leukæmias. There was need for research in this connexion. Sometimes the blood resembled that of pernicious anæmia, sometimes aplastic anæmia.

SECTION OF THE HISTORY OF MEDICINE.

Election of Officers.—Dr. Thomas Spens: the First Describer of the Stokes-Adams Syndrome.—Microscopy.—The Tomb of Avicenna.

A MEETING of this section was held on May 27th, Sir WILLIAM OSLER, Bart., the President, being in the chair.

The following were elected officers of the section for the ensuing session:—President: Dr. Norman Moore. Vice-Presidents: Dr. Henry Barnes, Dr. Richard Caton, Sir Henry Morris, Bart., Sir William Osler, Bart., Sir Ronald Ross, and Sir Frederick Treves, Bart. Honorary Secretaries: Dr. Raymond Crawfurd and Dr. Leonard G. Guthrie. Other members of Council: Sir John William Byers, Dr. Dudley W. Buxton, Dr. A. J. Chalmers, Dr. F. W. Cock, Mr. Alban Doran, Dr. David Forsyth, Dr. James Galloway, Mr. E. Muirhead Little, Dr. R. O. Moon, Sir Shirley F. Murphy, Dr. J. A. Nixon, Mr. George C. Peachey, Mr. D'Arcy Power, Dr. F. M. Sandwith, Dr. Charles Singer, Dr. George W. Steeves, Mr. C. J. S. Thompson, and Mr. P. Macleod Yearsley. Representative on Library Committee: Dr. Raymond Crawfurd. Representative on Editorial Committee: Dr. Leonard G. Guthrie.

Dr. RAYMOND CRAWFURD, in the absence of the author, read a communication from Dr. C. E. LEA upon "Dr. Thomas Spens; the First Describer of the Stokes-Adams Syndrome." The first undoubted case of this syndrome was published in the year 1793 by Thomas Spens, a Scottish physician resident in Edinburgh. It is claimed that Robert Adams, of Dublin, in 1827 reported the first clear case of heart block, and in the same year a similar case was recorded in great detail by Dr. William Burnett, who also called attention to Morgagni's cases published in 1761—two in number—of "epilepsy with slow pulse." Holberton described another case in 1841, but general attention was not directed to this condition until William Stokes, of Dublin, published four cases in 1846. Dr. Lea gave details of a case recorded by Dr. Spens.[1] It is contained in a volume of the "Medical Commentaries for the Year 1792," which was published at Edinburgh in 1793 and was edited by Dr. Andrew Duncan. The communication ended with a short biographical notice of Dr. Spens.—Dr. HUMPHRY D. ROLLESTON asked whether in the case of eponymic disease the name should be given of the first person who recorded a case or of the person who first drew general attention to it by the accuracy of his description?

Dr. CHARLES SINGER gave an account of the earliest period of Microscopy. Convex lenses, he said, though known for centuries, were first adopted for investigating nature at the end of the sixteenth century. They were probably used by Mouffet and Hoefnagel more than 60 years before such workers as Hook and Leeuwenhoeck perfected their methods of manufacture. The compound microscope was first discovered more or less accidentally by Zacharias, a Dutch spectacle-maker, about 1590. The idea was soon taken up by Galileo and its principles developed by the work of Snell van Royen and Kepler. Amongst the earliest practical users of the compound microscope were the noble Frederigo Cesi, founder of the Accademia dei Lincei, the Sicilian naturalist Hodierna, the Neapolitan astronomer Francesco Fontana, the French physician Pierre Borel, and the German Jesuit Athanasius Kircher. The introduction of the microscope into medicine may be especially attributed to Borel and Kircher. The pioneer period of microscopic discovery closed and the classical period commenced with the work of Hook and Malpighi after the middle of the seventeenth century. Dr. Singer described in detail the work of these writers and illustrated his remarks by their own figures.—Mr. D'ARCY POWER remarked that amongst the pictures of microscopes shown by Dr. Singer was one introduced by Descartes in 1637. Last year he had exhibited to the members of the section a portrait of William Harvey, dated 1639, in which the great discoverer of the circulation of the blood was represented with such an instrument. It seemed, therefore, as if Harvey had acquired such a microscope within two years of its invention.

Sir WILLIAM OSLER called attention to the need for restoring the tomb of Avicenna, which was again falling into decay, though it had been repaired on several previous occasions. He thought that the present cost of repair, including the expense of maintaining a watchman, would not exceed £500–£600. Such a sum of money might perhaps be raised without much difficulty by the combined action of the Société Française d'Histoire de la Médecine and the Royal Society of Medicine. These two societies were especially named because they represented the two European nations who were most interested in the state of medicine in Mohammedan countries. He suggested that the Persian Government should first be approached, and if a favourable reply were received a subscription list might be opened.

The members of the section afterwards adjourned to the Wellcome Historical Medical Museum, where Mr. C. J. S. THOMPSON showed the rearrangements that had been made during the recess.

SECTION OF DERMATOLOGY.

Exhibition of Cases.—Mycosis Fungoides.

AT the annual meeting of this section, held on May 21st, Dr. J. J. **PRINGLE**, the President, being in the chair, the following cases were exhibited.

The **PRESIDENT** showed: 1. A man, aged 64, who had suffered from Mycosis Fungoides since 1896 in whom the first symptoms consisted of mycotic tumours on the face which were removed surgically about 1900. Subsequently the disease became generalised over the trunk and limbs, but had been controlled in a remarkable manner by very free administration of X rays, and latterly by prolonged exposures to a strong arc lamp. Despite the unusually long duration of the disease his general health was practically unimpaired. 2. A very extensive characteristic case of "Parapsoriasis en Plaques" in a youth, aged 20, and of nearly a year's duration. He was exhibited mainly to illustrate a condition which was until a few years ago generally considered to be a pre-mycotic state.

Dr. S. E. **DORE** showed a man, aged 63, who presented a patchy erythematous and somewhat infiltrated Eruption over the Trunk and Limbs of two and a half years' duration. The lesions were in many instances crescentic, showing central involution and raised pad-like periphery which suggested that they were probably early mycotic manifestations despite the absence of itching.

Dr. J. H. **SEQUEIRA** read a paper opening a discussion on Mycosis Fungoides. After a short review of the history of the disease he proceeded to discuss its etiology, basing his observations upon 13 personal cases and 61 case-histories from literature. Of these 74 cases, 46 of the patients were males and 28 females. The extremes of age at which the disease came under observation were 15 and 75 years, the three youngest patients being females respectively 15, 16, and 17 years old. Traumatism was the apparent determining cause in two of the recorded cases, but in most instances the patient had enjoyed good health up to the onset of the malady. Mycosis fungoides has been variously believed to be a granuloma, a form of sarcoma, cutaneous lymphadenoma, and lymphosarcoma. After discussing the histological and clinical features Dr. Sequeira concluded that the disease bore no relationship to lymphadenoma and leukæmia; that it was not sarcoma, but a disease *sui generis*. The examination of the blood was of no assistance, as there were no characters peculiar to the disease. As special points for discussion, he asked whether it was possible to make the diagnosis in the pre-tumour stage on (*a*) clinical grounds, or (*b*) the histology of the lesions. He believed this could be accomplished in some cases. The effects of X ray treatment were discussed, and it was held that while such treatment undoubtedly removed both the infiltration and the tumours, and certainly prolonged life and relieved suffering, it was still doubtful whether it was possible to effect a cure in this grave malady, even by the repeated use of the rays, and in support of this he gave brief accounts of the cases which he had had under his personal observation. As a last question for discussion he raised the subject of the cause of death in mycosis fungoides. In some few instances a fatal issue appeared to be brought about by metastases in the vital organs, but in most cases it appeared to be due to diarrhœa and general exhaustion.

Sir **MALCOLM MORRIS** related the histories and showed photographs of two cases of mycosis fungoides in a man aged 52, and a woman aged 28, who had been recently under his care. The former was in an advanced stage of the disease, and in spite of marked temporary improvement under X ray treatment one of the lesions in the frontal region persisted, and eventually caused his death in April last. The second patient was still under treatment, and the disease had been checked and a large number of the lesions had disappeared as the result of repeated doses of X rays. The speaker inquired if histological examination could enable a diagnosis to be made in the early stages of the disease, and suggested research on these lines.

Mr. J. E. R. **MACDONAGH** dealt in an exhaustive manner with the subject of lymphocytes and their presence and alterations in the tumours of mycosis fungoides and other allied conditions. His remarks were illustrated by numerous admirable microscopic preparations shown by the epidiascope. The practical conclusions he had arrived at were that, first, mycosis fungoides was not a disease *sui generis* but merely one of a series of affections of the lymphatic system, and second, that the diagnosis of the early stage of mycosis fungoides could not be made by mere microscopic examination of excised portions of tissue.

Dr. A. **DOUGLAS HEATH** (Birmingham) said he thought that the multiformity of the cells in all stages of mycosis fungoides distinguished it fairly well histologically from other granulomata and from the sarcomata. He showed photographs and sections from a fatal case of multiple sarcomata of the skin resembling the "*d'emblée*" variety of mycosis fungoides.

Dr. G. H. **LANCASHIRE** (Manchester) recalled a series of six cases which had come for treatment to the Manchester and Salford Hospital for Skin Disease some years ago. They all came during a period of three or four years, and since then the speaker had seen only one case, a private one, in the early pre-mycotic stage. The hospital cases were in various stages, mostly advanced, and some with large tumours. Photographs were shown. From the history given all these cases had been preceded by "dry-eczema" plaques, and all had had marked itching; all had died, but some were alleviated for a few years by X ray treatment.

After some remarks by Dr. R. A. **BOLAM** (Newcastle-on-Tyne),

Dr. J. A. **NIXON** (Bristol) referred to two cases which had come under his observation. One was a man, aged 65, who presented himself on one occasion only at the out-patient department. The other case was that of a young married woman, aged 26; her disease lasted about two years. It began with an eruption resembling tinea versicolor; after six months tumours appeared upon erythrodermic areas. These tumours suppurated freely from multiple small crater-like openings. The usual temporary improvement followed the application of X rays. Autogenous vaccines were tried without the slightest improvement. Eventually, after two years, the patient became covered from head to foot with huge fungating tumours and died suddenly from exhaustion. The case presented no resemblance either to lymphadenoma or leukæmia. The blood only showed some leucocytosis, which might have been accounted for by the suppurative process present.

Dr. W. **KENNETH WILLS** (Clifton) had only seen one case, which had apparently resulted from a wound round the margin of which a large single tumour formed. It was the case of mycosis *à tumeurs d'emblée* reported by the President at the March meeting of the section.

Dr. **GORDON R. WARD** said that he thought there were very close analogies between mycosis, leukæmia, and Hodgkin's disease. All might present analogous skin lesions of a nodular nature; all were chronic, reacted well to X rays at first but recurred later, and at times showed enlargement of the glands and spleen. He would like to hear more of the histology of glands in mycosis fungoides. Were the changes spread throughout the gland as in leukæmia, or localised as in a secondary malignant focus? Were there any clinical characteristics of mycosis glands? Finally, was it not possible that some of the deaths from mycosis were really referable to the very massive doses of X rays given?

The debate on mycosis fungoides was adjourned until June 4th.

LONDON DERMATOLOGICAL SOCIETY.—A meeting of this society was held at St. John's Hospital for Diseases of the Skin on May 19th, Dr. Morgan Dockrell, the President, being in the chair.—Dr. J. L. Bunch showed two cases: 1. A girl, aged 19, with a Raised Indurated Lesion on the Left Cheek, which he thought at first might be actinomycosis. Bacteriological examination of the pus revealed large numbers of acne bacilli, which were grown quite readily on ordinary agar culture media at the end of four days' incubation at 37° C. 2. A woman, aged 62, with a Symmetrical Hyperkeratosis of the Palms and Soles of the Feet due to absorption of arsenic.—The President showed a case of Idiopathic Multiple Hæmorrhagic Sarcoma in a man aged 48. The duration of the disease was from two to three years; the condition first commenced with an œdema of the hands and feet, then a papular condition appeared which showed an effusion of blood with some bruising; the lesions then suddenly disappeared, leaving some small nodules showing the hæmorrhagic condition. Microscopically, there was involvement of the connective tissue with an increase of spindle-shaped cells and dilatation of blood-vessels.—Dr. W. Knowsley Sibley showed: 1. A case of Erythema Annulare in a woman aged 56, who had had recurrent attacks for 18 months, the present condition consisting of a lesion on the back of the hand and forearms which had been present for five days and was rapidly fading. 2. A girl, aged 18, with Dermatitis Artefacta in the form of a symmetrical bullous eruption, which appeared on different parts of the body, here and there occurring in straight lines.—Dr. W. Griffith showed a case of Cicatricial Alopecia and of Lupus of the cheek of 34 years' duration.—Dr. Simonds Gooding showed a case of Para-psoriasis in a woman aged 42. The lesions were present on the front of both legs.—Mr. Frank Curry then gave a laboratory demonstration and exhibit on Tuberculins, their Preparation and Standardisation. The exhibit was prepared at the Wellcome Physiological Research Laboratories.

BRITISH OTO-LARYNGOLOGICAL SOCIETY.—A meeting of this society was held on May 13th, Mr. A. J. Martineau (Brighton) being in the chair.—Mr. J. Walker Wood read notes of a case of Double Acute Frontal Sinusitis due to the Diphtheria Bacillus. A few pneumo-bacilli were also found in the discharge. 4000 units of anti-diphtheritic serum were given, followed in three days by 2000 units and removal of the anterior end of both middle turbinals. Subsequent irrigation of the cavities led to the complete cessation of the acute condition. Mr. Wood also showed specimens of Ossicles (malleus and incus) with mass of cholesteatoma removed while carrying out a routine examination from the auditory meatus of a patient, aged 24, who made no complaint of any discharge. There had been aural discharge in childhood, but none for the last ten years.—Mr. Charles J. Heath read notes of a case of Deafness accompanied by Nasal Obstruction, caused by an abscess in a mass of adenoids, and accompanied by considerable swelling of the glands of the posterior triangle of the neck on both sides; there was a free flow of pus through both nostrils during the removal of the adenoids and rapid and complete recovery afterwards. Mr. Heath also showed a case of Acute Otitis Media accompanied by Vertigo due to swelling of tympanic mucous membrane. There was profuse discharge from and pain in the ear, both caused by retention of secretion in the mastoid antrum (acute mastoiditis). Relief by conservative mastoid operation, and complete restoration of hearing.—Mr. Martineau said that he had seen several cases this year of acute ear trouble without the classical signs of middle-ear and antral disease. At operation an unusual amount of disease in the mastoid had been found.—In reply to a question Mr. Heath said that during the conservative mastoid operation he left at least one-eighth of an inch of the hinder part of the bony meatus to protect the ossicles and the drum-head.—Mr. Frederick Spicer showed two cases for diagnosis.

Reviews and Notices of Books.

A Text-book of Medicine.

By G. DIEULAFOY. Second edition. Authorised translation from the sixteenth edition of "Manuel de Pathologie Interne" by V. E. COLLINS, M.D. Lond., M.R.C.S. Eng., L.R.C.P. Lond., and J. A. LIEBMANN, Ph.D., M.A., LL.D. In two volumes. London: Baillière, Tindall, and Cox. Pp. 2156. Price 25s. net.

IN our review of the first English edition of Professor Dieulafoy's well-known text-book of medicine we referred to its original and instructive character, and pointed out its special value as representative of French medicine, while we were glad to observe that due recognition was given to the work done in this country. We then discussed its contents at considerable length, and expressed a highly favourable opinion of its usefulness as a text-book and work of reference. This new edition has been translated from the sixteenth French edition, which was published just before the death of its distinguished author. It retains the general arrangement and special features of its predecessor, and does not therefore need detailed examination in our columns. It has been thoroughly revised.

Among the many new sections which have been incorporated we may mention that dealing with pachypleuritis and inexhaustible pleurisy, under which terms Professor Dieulafoy has described cases in which pleurisy with effusion may last for years, the effusion recurring almost immediately if paracentesis is carried out. Septicæmia due to certain specific organisms such as the streptococcus, staphylococcus, and gonococcus now receives special description, and in this connexion the importance of blood culture is strongly emphasised. An interesting account of the condition of sporotrichosis is given, and its history, pathology, diagnosis, and treatment are dealt with clearly and succinctly. Another new section is that devoted to a consideration of hæmolytic icterus, in which both the congenital and acquired forms are carefully described and differentiated. The methods of investigating the fragility of the red corpuscles are indicated. Some recent developments in regard to treatment are discussed in an appendix. The new arsenical compounds, hectine and Ehrlich's salvarsan, are critically considered. The therapeutic uses of vaccines and their control by the use of the opsonic index are briefly referred to. The employment of superheated air in the treatment of gangrene, arthritis, and neuralgia is favourably reviewed.

Professor Dieulafoy's text-book is a most interesting and instructive work, and one we can strongly recommend. The translators have, as in the previous edition, carried out their work admirably, so that even in translation the descriptions given of the illustrative cases, which are frequently interpolated in the text, retain their arresting and almost dramatic vividness. The discussion of the pathological problems involved and the various forms of treatment recommended show fully the great critical and analytical faculties of the learned French clinician, whose text-book forms a worthy monument of his clinical acumen and industry. It is true that his genius for description and classification has led to a number of conditions being regarded as distinct clinical or pathological entities, which are hardly so regarded in this country at present, but these in some ways only serve to heighten the interest afforded by a careful study of this book and to increase its suggestiveness.

Diseases of the Rectum and Anus, including the Sixth Edition of the Jacksonian Prize Essay on Cancer.

Fourth edition, reprinted to include the Opening Address on the Surgical Treatment of Rectal Cancer, delivered at the Annual Meeting of the British Medical Association, Liverpool, 1912, by HARRISON CRIPPS, F.R.C.S. Eng., Consulting Surgeon, St. Bartholomew's Hospital. London: J. and A. Churchill. 1913. Pp. 588. Price 10s. 6d. net.

THE length of the title of this work somewhat reminds us of the title-pages of books of a century or two ago; however, it gives the reader a very good idea of the contents. It is superfluous nowadays to praise any writing on the diseases of the rectum coming from the pen of Mr. Harrison Cripps, and therefore we need do no more than indicate what this book contains. An interesting account of the anatomy is given, and in this connexion the author's teaching with regard to the anastomoses of the hæmorrhoidal veins is worth noting, for he holds that there is very slight, if any, anastomosis between the radicles of the hæmorrhoidal branches of the inferior mesenteric vein and the radicles of the internal iliac vein. Of this he adduces two proofs: in the first place, it is impossible to inject the hæmorrhoidal plexus through the iliac veins; and, secondly, it is impossible to inject the iliac veins through the hæmorrhoidal plexus. Another noteworthy point is that the author considers that a good deal of absorption goes on in the rectum, though modern opinion is tending in the opposite direction. Further, he has made observations which have led him to hold that the nuclei of the columnar epithelium lining the rectum give rise to leucocytes.

The chapter on diagnosis should prove of service to the learner. Mr. Cripps tells us that he has long ago discarded the use of a rectal speculum, except the duck-bill which he employs in operating. He holds that a speculum can never be usefully employed except when the patient is under an anæsthetic. The educated finger is, he tells us, far the most trustworthy and satisfactory instrument for diagnosis. In the chapter on imperforate anus the author has collected a good deal of evidence to show that in many persons on whom an operation has been performed the bowel has been perfect functionally even many years after the operation. These facts are of special interest, for surgical literature contains many references to the immediate effect of these operations, while the records are few as to the ultimate results. In the treatment of fistula in ano Mr. Cripps still uses the elastic ligature in exceptional cases when the nervous or physical condition of the patient renders a cutting operation inadvisable; he considers it especially suitable in cases of phthisis, for the patient need not be confined to bed.

Probably the most important section of the book is that dealing with cancer of the rectum. This is based on the Jacksonian prize essay, which Mr. Cripps wrote in 1876. It is satisfactory to find the author stating that in his experience an early and free removal is followed by a good percentage of cures; and from his statistics it appears that in 37·6 of his cases which he was able to trace for three years no recurrence had occurred. Mr. Cripps has appended a valuable series of tables relating to cancer of the rectum.

In conclusion, we may say that this work will compare favourably with any treatise on diseases of the rectum in any language.

Diseases of Children: A Manual for Students and Practitioners.

By JOHN MCCAW, M.D. R.U.I., L.R.C.P. Edin. London: Baillière, Tindall, and Cox. 1914. Pp. 524. Price 10*s*. 6*d*. net.

IN offering this little work on the diseases of children to students and practitioners the author expresses the view that there is possibly room for another work on this subject, if of moderate dimensions and of modest price. There can be no doubt that both students and practitioners deserve all the encouragement possible to stimulate them to equip themselves in this important subject as thoroughly as the exigencies of an already overcrowded curriculum and a generally too busy life in active practice may permit.

We have read this little book with some care, and have come to the conclusion that it contains all the information students and practitioners usually require, and in as short and compact a form as is compatible with lucidity. Dr. McCaw appears to have kept himself well informed of the progress of modern pædiatrics, and we notice that mention is made of most of the rarer diseases and pathological curiosities, and not to the exclusion of the more common diseases.

The author adheres for the most part in a very conservative manner to the traditional lines on which works of this kind are usually arranged. There is, however, a new suggestion in the chapter on that much-discussed condition to which the name of cœliac disease was originally given by Dr. Gee. Dr. McCaw finds that one of the peculiarities of this disease is that the liver remains small, and he tentatively suggests that a delayed development of this important organ and a want of bile may be concerned in the pathology. Although the stools in such cases are undoubtedly pale in colour, we were not aware that there was evidence to prove that the actual secretion of bile salts or bile colouring matter was reduced in this disease. Indeed, the very name acholia, given to it by the late Dr. W. B. Cheadle, may from this point of view be open to objections.

With regard to the pathology of two other common conditions, rickets and scurvy, it is interesting to note that the author ascribes a very simple explanation to the first—namely, that it is a general disease, consequent on absorption of toxins from the intestines as a result of improper feeding and catarrhal inflammation; and a very guarded one in the case of the latter—namely, that it is due to defective diet and want of fresh food. He gives Professor Ausset's comparatively little known theory that scurvy is a disease of an infective nature, and he omits all mention of the recent and important work that has been published on the subject of the vitamines. Rheumatism and rheumatoid arthritis are also included among the infective disorders. In the article which deals with convulsions no distinction is made between the exciting cause that determines the convulsive seizure and those predisposing causes that raise the excitability of the nervous sphere; the etiology is explained on grounds which may be indifferently referred either to exciting or to predisposing causes. The position is not made clear that an exciting cause is always necessary for the determination of an explosion, and that so-called spontaneous cases of convulsion cannot exist, although they may occur on very slight provocation in those conditions in which the level of excitability has been unduly raised from hereditary, congenital, or environmental causes.

Die Erkrankungen der Blutdrüsen.

Von Professor Dr. WILHELM FALTA, Wien. Mit 103 Textabbildungen. Berlin: Julius Springer. 1913. Pp. 550. Price, paper, 22 marks; bound, 24.50 marks.

THIS useful and readable text-book is concerned only with the clinical side of diseases of the ductless glands. Their experimental physiology and pathology are alluded to merely as occasion requires. The work is based mainly on personally observed cases, in the examination of which the author has had the advantage of collaboration with neurologists and others. How extensive even this limited aspect of the subject has become may be gauged from the size of the book—550 closely printed pages of large octavo; and yet the author's style is not prolix, nor are his clinical cases reported at undue length; nor, finally, are we confronted with much of the "spade-work" with which not a few German text-books seem to find it impossible to dispense.

An introductory chapter deals with such general considerations as the relation of the ductless glands to the nervous system, their inter-relations and bearing on growth and metabolism, their connexion with the hæmopoietic system, and pluriglandular disturbances. Then in turn the diseases of the thyroid, parathyroids, thymus, hypophysis, epiphysis, suprarenals, and sex glands are described and illustrated. Polyglandular syndromes are next discussed, and there are sections on dwarfism, achondroplasia, mongolism, the diseases of the islets of Langerhans and their relation to diabetes mellitus, the varieties of obesity and adiposis dolorosa. It will thus be seen that a great deal of ground is covered in the book and that conditions whose association with impairment of function of the ductless gland system is doubtful are nevertheless given a place. In each chapter, it should be said, there are useful introductory paragraphs on the anatomy and embryology of the glands concerned.

The author's classification of infantilism will probably be somewhat unfamiliar to the English reader. This matter of infantilism is certainly one of the most difficult questions in the whole subject, and it is one on which much work remains to be done. We do not find in the book any very clear recognition of a retrograde infantilism, nor is the type described as ateleiosis by Gilford apparently regarded as such, at least in any definite way. The author distinguishes two varieties, following Hansemann: (1) nanosomia primordialis, in which the dwarfism is congenital and seen at birth, but with the exception of the smallness of stature development is otherwise normal, and (2) nanosomia infantilis (Paltauf's type), where the infant develops normally up to a certain age and then development abruptly comes to a standstill.

With its fine illustrations, good bibliographies and indices, and its general conciseness and appreciation of essentials, the volume is, we consider, a really excellent presentation of the clinical aspect of a most important and interesting group of diseases.

Allen's Commercial Organic Analysis.

Volume VIII. Fourth edition. Entirely rewritten. Edited by W. A. DAVIS, B.Sc., A.C.G.I., and SAMUEL S. SADTLER, S.B. London: J. and A. Churchill. 1914. Pp. 696. Price 21*s.* net.

BY the issue of the eighth volume this "treatise on the properties, modes of assaying, and proximate analytical examination of the various organic chemicals and products employed in the arts, manufactures, medicine, &c.," is concluded. The editors, however, propose to issue later "a supplementary volume which shall contain not only a complete reference index of the whole work, but shall bring the latter completely up to date by the incorporation of all processes of analysis and information regarding analytical processes which have appeared in the interval that has elapsed since the revision of the work was first taken in hand."

The first volume of this edition was issued in 1909, so that the editors have undertaken to supplement the present materials by a record containing the advances in analytical chemistry which have been made during the past six years or so. This attempt, of course, recognises the difficulty or impossibility of keeping a work absolutely in touch with new developments. In analytical chemistry these developments refer mostly to details of procedure which do not always affect general principles or the outlines of a broad scheme of examination. It is on modern general principles of analysis applied to organic products employed in the arts, manufactures, medicine, &c., that the new edition of "Allen's Commercial Organic Analysis" will be trusted and valued. The volumes may have lost in regard to general arrangement their identity with the original volumes, but care has been taken to secure a staff of writers each well qualified to write upon the particular subject relegated to him. That is peculiarly obvious in the later volumes, and especially in the one before us. Each writer here is an acknowledged authority on the subject with which he deals, and the subjects in this case happen to possess medical significance. For example, E. Frankland Armstrong contributes a practical section on "Enzymes," and another on "Proteins of Plants"; S. B. Schryver a chapter on the "Proteins and Albuminoid Substances," and by the same author is a chapter on "Digestion Products of the Proteins"; L. L. van Slyke, one on the "Proteins of Milk"; Henry Leffmann on "Milk" (composition and analysis); W. D. Richardson, of Chicago, the chapter on "Meat and Meat Products"; J. A. Gardner, with G. A. Buckmaster, the chapter on "Hæmoglobin and its Derivatives"; Jerome Alexander, of New York City, the chapter on "Albuminoids or Scleroproteins," and W. P. Dreaper that on "Fibroids" (silk, hair, wool, &c.)

This volume completes a series which provides the analytical chemist and others with an excellent armamentarium, and it may be remembered that scarcely a day passes without witnessing the introduction of new organic products which sooner or later come to possess both scientific and commercial importance. The need of a work of reference on this special section of analysis is therefore evident, and the volumes we have referred to will, we are sure, be found to meet the case.

Chronic Colitis, its Causation, Diagnosis, and Treatment.

By G. HERSCHELL, M.D. Lond., and A. ABRAHAMS, M.D. Cantab. With 4 figures. London: Longmans, Green, and Co. 1914. Pp. 276. Price 6*s.* net.

IN their account of chronic colitis the authors lay great stress on the necessity of diagnosing the cause accurately and giving individual treatment in each case. Very commonly the disease results from chronic constipation and the purgative habit; in other cases it is the result of chronic infection from pyorrhœa, post-nasal catarrh, or chronic appendicitis, for example; the influence of the nervous system in its production is nowadays held to be negligible. An excellent account of the most recent methods of diagnosing chronic colitis is given, in which the services of the pathological chemist and the bacteriologist are freely invoked. Treatment is gone into with great thoroughness, and occupies 120 pages. Detailed recipes for the preparation of a number of drinks and dishes are set out, and should prove of service to those who are called upon to look after these very troublesome cases. Numerous references to the literature are given throughout the volume.

The book is highly dogmatic, clearly written, and quite practical; it may be recommended to the attention of all medical practitioners. But a protest against the word "scybalæ" (pp. 14, 21) must be registered. It derives from the word "scybalon"; but the plural of "scybalon" is "scybala," and "scybalæ" is formed by false analogy.

Kurzes Lehrbuch der Militärhygiene.

Von Dr. Jaroslav Hladik, Oberstabsarzt. Wien und Leipzig: Josef Safár. 1914. Pp. 532. Price 12 marks.

The author is professor of hygiene in the military medical technical school at Vienna, and has written this manual of instruction to replace the one hitherto in use, which has become out of date. He has aimed at making it essentially practical and comprehensive, and has included a description of such processes of chemical analysis and bacteriological cultivation methods as may be carried out by the ordinary trained worker who is not a specialist. The book is, therefore, on the lines of the well-known treatise by Parkes, which for so many years occupied an unchallenged position in this country as a comprehensive and authoritative text-book on all branches of hygiene.

The author divides his subject matter into 17 chapters. The first 11 of these deal successively with air, soil, water, clothing, food, removal of excreta, burial of the dead, hygiene of the dwelling, ventilation, heating and lighting. The arrangement does not seem very logical or natural—a matter of some importance for the beginner in the study of this subject. In the chapter on air, its chemical composition and the significance of the various components are described, and some account is given of meteorology and the main facts regarding climate. Mr. John Aitken's observations on dust and precipitation are mentioned, but there is only brief allusion to the impurities met with in the atmosphere. The amount of water required is placed at about 120 litres per head per day—that is, 26½ gallons—for all purposes. This, though rather more than the amount supplied to Berlin, is hardly so much as would be aimed at by the hygienist in this country, where for many years 30 gallons have been considered to be the quantity that should be provided if possible. A rather full account is given of the fauna and flora found in water, with numerous figures. The description of purification by filtration is hardly so detailed as its importance demands. On the other hand, the chapter on food and alimentation occupies more than a hundred pages—that is, about one-fifth of the whole work. This subject is very well treated. In regard to alcohol, the author considers that it is unnecessary for persons in health. The advantage of abstainers over non-abstainers in regard to expectation of life is alluded to, as shown by English assurance statistics, but no facts bearing on the question are adduced from German experience.

Removal and disposal of sewage is dealt with very shortly in 20 pages, and in regard to the importance of the subject according to English ideas it can hardly be said that the treatment is adequate. The use of petroleum for urinals is recommended. It would be well if this were more widely adopted in our own country; we believe it has been in general use in army barracks for some years with satisfactory results. Ventilation is discussed shortly in 15 pages, and the practical difficulties to be overcome seem to be hardly appreciated. Heating and lighting, on the other hand, receive full consideration; a good description is given of artificial methods of warming, which, of course, are used more extensively and are of greater variety in Austria than in Britain. A temperature of 18° to 20° C. is recommended for living rooms, a little higher than that proposed by Rubner, and, of course, higher than is usual with us, where 18° C. (= 64·4° F.) would be generally considered sufficient. Electric heating promises to be ideal, but Körting is quoted as estimating the cost at 20 times that of a coal fire. The chapter on clothing is original in its treatment, and full of interest. An important point not always given sufficient attention to is the shape of the boot—the right shape and the reason for it are explained. A diagram shows the Meyer and Starke lines, and their significance is made clear. In the chapter on hospitals several plans are given of buildings of modern design in Vienna and elsewhere, which seem to be remarkably complete.

The concluding chapters deal with infectious diseases and their prevention. Tuberculosis comes first, and is declared to be the most destructive of all by reason of its universal prevalence. Of late years it has declined in the Austrian army. The death-rate in 1875 was more than 2 per 1000 of the strength; it has now fallen to 0·61 per 1000. Infection is regarded as being chiefly direct from person to person, milk and meat being unusual and subordinate spreaders of the disease. Vaccination is thoroughly carried out in the Austro-Hungarian army, and since 1898 not a single death has occurred from small-pox. Enteric fever is regarded as being chiefly propagated by water; after this by milk, and, thirdly, by contact cases. Paratyphoid fever is described succinctly; also phlebotomus fever and trypanosomiasis (shortened to "trypanosis," which is hardly legitimate).

The volume contains 134 illustrations, and is to be recommended as a comprehensive text-book of military hygiene.

LIBRARY TABLE.

Hygiene and Diseases of India. A Popular Handbook. By Lieutenant-Colonel Patrick Hehir, M.D. Brux., I.M.S. Third edition. Madras: Higginbothams, Limited. 1913. Pp. 1003. Price Rs. 6.8, or 8*s.* 8*d.*—This compact volume gives in simple and untechnical language a comprehensive account of all matters relating to hygiene and public health in India. It is divided into three sections. In Section I., entitled General Hygiene, water, its supply, examination and purification, air and ventilation, food and dietetics, the removal of excreta, sanitation of towns and villages, and public health regulations are considered. Section II. deals with the skin and its functions, bathing, clothing, exercise, disinfection, bacteriology, immunity and animal parasites, with some general remarks on infectious diseases, thus composing rather a heterogeneous section, hardly well named "Personal Hygiene." The rest of the work, forming Section III., consists of an account of the diseases of India, arranged more or less alphabetically. The author has industriously brought together a large amount of information, but it cannot be said to be presented in any order, or digested into any satisfactory form; it is, therefore, not an easy book to refer to, and the absence of any table of contents is inexcusable. On page 23, referring to goitre in connexion with water, the author states that "the evidence to incriminate water ...... is not very convincing"; McCarrison's researches in Kashmir have placed the matter beyond doubt. The *carrying* a gallon of water 50 yards does not involve the same amount of muscular work as the *lifting* it 150 feet, as implied on p. 42. The available capacity of a reservoir is said (p. 60) to be "the volume contained between the lowest working water levels," a statement that has no meaning; there is obviously an omission.

The account of filter beds is inadequate, especially in view of the great attention that has of late been paid to this subject in India. On p. 87 it is stated that the acid produced by the colon bacillus causes the litmus solution to become blue or bluish. The remark on Chamberland and Berkefeld filters that "there is little to choose between them" requires amplification; as does the subsequent statement that "no other filters are reliable." With regard to domestic filters in general, stress is laid upon the need for cleaning them, but nothing is said as to sterilisation. The account of bacterial purification of sewage (which comes under the head of Removal of Excreta) is very inadequate. To stigmatise the pail or pan used for removal as "a movable cesspool" (p. 316) is not reasonable, especially as on the next page the author admits that, "taking all circumstances into consideration, it is that which appears to be the most efficient of the 'dry' systems for a large Indian community." The use of the word "cistern" for cesspool is very unusual and to be deprecated. Having criticised some points of detail it remains for us to repeat that in compact form Colonel Hehir has here compiled a useful handbook, full in its treatment, and evidently based largely on practical experience. If the misprints and peculiarities of spelling were amended, and more care taken as to the arrangement of the information, the book would be pleasanter to read.

Expectant Motherhood: its Supervision and Hygiene. By J. W. BALLANTYNE, M.D., F.R.C.P. Edin., Physician to the Royal Maternity Hospital, Edinburgh. London, New York, Toronto, and Melbourne: Cassell & Co. 1914. Pp. 288. Price 6s. net.—This book deals with a discovery in medicine and the laws which will follow or have already followed it. It has to do with the health value of the nine months which precede birth, and with the commandments in hygiene which the parents, but especially the mother, must obey if their child is to come strong and well into the world; with the investigation of all the things which may go wrong with the unborn infant, and with the inquiry into their possible prevention or cure; with the well-being of the babe before birth, and consequently with the care and protection of the mother who bears him in her womb. In scientific language the subject is that of antenatal or prenatal hygiene and pathology and of gestational therapeutics; in more popular words, it is that of health and disease before birth and of the care of the expectant mother in health and sickness. We can only reach the unborn infant through the mother who carries him, and so the prenatal life of the child and of the mother who bears him in pregnancy are closely bound together and depend one upon another. It would be difficult for us to describe the nature and scope of this book better than in the words of the author, and for this reason we have quoted freely from the introduction. Anything that Dr. Ballantyne writes is always interesting, and this book is no exception. The whole forms a fascinating account written with the author's usual charm and lucidity, and is a book which should be in the hands of every young married woman.

Dental Diseases in Relation to Public Health. By J. SIM WALLACE. London: The Dental Manufacturing Company. 1914. Pp. 93. Price 3s. net.—The dental profession has for years realised the great importance of dental diseases in relation to public health, and has been most persistent in bringing this question before the proper authorities. It must indeed be a satisfaction to those who have worked so hard in this direction to know that public health authorities are now fully alive to the great influence that the teeth have on the welfare of the community. Dr. Sim Wallace's last work would therefore seem to have been published at an opportune moment, and should prove of inestimable value to those interested in this great question. The book is really a reprint of three communications: the first to the International Medical Congress, the second to the Royal Sanitary Institute, and the third to the State Medicine Section of the British Medical Association, 1912. Of the three papers, the first is by far the most important, and it is a most masterly exposition of the subject. It is thoroughly logical, and cannot fail to bring home even to the doubter the great economical importance of dental disease. The author shows that diseases of the teeth are quite easily preventable, and would be easily prevented if the medical profession would lend their aid, partly by realising the nature of the pathological processes and partly by advocating a rational dietary. We are in entire accord with this statement: "If the diseases of the teeth are prevented the hundreds of thousands, perhaps millions, of pounds which are spent on their treatment would be prevented. So, too, if the diseases of the teeth are prevented, the millions of pounds which are spent on the treatment of diseases resulting from diseased teeth would be saved."

MISCELLANEOUS VOLUMES.

OF medical interest in our miscellaneous column this week are the following. The Address of Sir HENRY MORRIS on *School Education and the Influence of the Study of Nature*, delivered at Epsom College on Founder's Day, July, 1913, was abstracted at some length in THE LANCET of August 2nd, 1913, p. 340. As now republished in pamphlet form (London: John Bale, Sons, and Danielsson, Limited. 1914. Pp. 24) it contains several passages which had to be omitted in the delivery, and doubtless all Epsomians and many others especially interested in medical education will be glad to have the opportunity of perusing at leisure so extensive a review of the principles that have animated educationists from ancient Egypt and Assyria, through Rome and Greece, the Middle Ages and the Renaissance, down to modern times.——We published in our issue of April 11th (p. 1035) a communication by Mr. HEATON C. HOWARD, L.R.C.P. Lond., M.R.C.S., on the *Therapeutic Value of the Potato.* The matter then published has been used as the basis of an extended brochure (London: Baillière, Tindall, and Cox. 1914. Pp. 31. Price 1s. net), which contains in addition chapters on special bandaging, hypodermic medication, a digit meter, and a hallux meter.——The Scientific Press, Limited, have published a *Case-book for Massage and Weir Mitchell Treatment* (price 6d., containing 54 case sheets). The massage sheets are ruled for patient's name, address, and age, doctor's name, nature of complaint, treatment ordered, with columns for height and weight measurements, pulse, temperature, and an account column. The Weir Mitchell sheets give necessary columns for diet, condition, electrical treatment, and pulse condition before and after.

Questions of social economics are becoming more and more of paramount interest to medical men. In THE LANCET of March 11th, 1911, and again in that of Jan. 27th, 1912, we commended a series of essays on "Duty and Discipline," designed to compel attention to the very obvious growth of indiscipline and to the general decay of the sense of duty. In further extension of the Duty and Discipline Movement we have before us a new book, *Anarchy or Order. Twelve Papers for the Times* (London: Duty and Discipline Movement, 117, Victoria-street. 1914. Pp. 125), pointing out that while anarchist doctrine is rarely formally *held* or preached by British men and women, anarchist *modes* of thinking and living are encountered *every day* in all ranks. The first paper, On Anarchy, by Helen Hester Colvill, contains much wisdom, and is written with an enticing charm of manner. She bewails the substitution of secular for ethical and religious knowledge. She describes the method of "Signora Dottoressa Montessori telling us in no uncertain tones that she is going to reform education all over the world, from *the children's point of view*," and seriously questions whether in all this new system unwilling children ever really gain the power of doing something they don't want to do. If the good intelligent children grow up reasonable and disciplined—though perhaps "soft"—what, she asks, about the naturally insubordinate, mischievous, dull, perverse, perhaps vicious? Other essays deal with sentimentality, decay of authority, the training of children, and an introduction, entitled "A Voice of Warning," to the ethical works of Dr. F. W. Foerster.

The holiday season is upon us. *Holidays and How to Use Them*, by CHARLES D. MUSGROVE, M.D. Edin. (Bristol: J. W. Arrowsmith, Limited. 1914. Pp. 205. Price 2*s*. 6*d*. net), is an attempt, and a successful one, to deal with the numerous trifles which, if neglected, are apt to mar a holiday. The book is written in a chatty and pleasant manner. The first chapter opens with an inquiry into the object of holidays, which, as the author rightly says, are a form of life insurance against failing powers and ill health. This is followed by general directions as to packing up, diet, baths, reading, railway journeys, and other important small matters, and an account of the various sorts of holidays—seaside, country, town, mountain, lake, and so on, as well as the most suitable recreations, such as sketching, photography, fishing, and natural history. Walking, climbing, cycling, motoring, camping and other holiday occupations claim the author's attention, and there is a chapter on ailments incidental to holidays. The child is not forgotten, and those who have the planning of holidays for little ones will find much help from a perusal of the chapter dealing with the subject. The book is a practical one.——The next question as to holidays is, Where shall we go? A perusal of *The Queen Newspaper Book of Travel: a Guide to Home and Foreign Resorts*, compiled by M. HORNSBY, F.R.G.S. (London: The Field and Queen, Limited. 1914. Pp. 542. With 21 maps and 72 illustrations. Price 2*s*. 6*d* net), will suggest the answer. In this guide the various British and foreign health resorts are arranged in alphabetical order according to countries, brief notes being given with regard to climate, accommodation, amusements, and other matters. There are also practical hints on touring for the visitor to foreign countries, articles on outfits, luggage, foreign etiquette, and so forth, tables of routes and fares from London, and a comprehensive list of guide-books and other literature dealing with travel. There is also a directory of English medical men resident abroad. Altogether it is a useful book. ——For those who decide on a holiday abroad the new and enlarged edition of *German Self-Taught, with Phonetic Pronunciation*, revised by W. E. WEBER, M.A. (London: E. Marlborough and Co. 1913. Pp. 146. Price, paper, 1*s*.; cloth, 1*s*. 6*d*.), contains lists of useful everyday words and phrases, together with their pronunciation—quite sufficient for anyone to acquire an elementary knowledge of German of particular use to the tourist. The book should fulfil business and social requirements also. Previous editions of this book included a brief summary of German grammar, but this now forms the basis of another little volume, *German Grammar Self-Taught*, by W. E. WEBER, M.A. (same publishers and price. Pp. 144). This is written primarily for those who have no opportunity of obtaining tutorial assistance.

For those interested in the municipal, commercial, or social life of the City of London, the *City of London Year Book and Civic Directory, 1914* (London: W. H. and L. Collingridge. Pp. 392. Price 5*s*. net), is an important work of reference. In addition to lists of members of the Corporation and of the London County Council and articles on the work of these bodies for the past year, it contains brief histories of the livery companies, accounts of the charities attached to them, addresses of officials and members, and much information of a like character. Particulars of City schools, with details of fees, scholarships, and so forth, are also given, and in the commercial section will be found an official list of the members of the Stock Exchange, the Baltic, and Lloyds. Some of the information in this book is not to be found in other annuals, and the fact that it appears at the end of the first quarter of the year is an obvious advantage, as official changes made in the early months of the year can thus be included.

THE GENERAL COUNCIL OF MEDICAL EDUCATION AND REGISTRATION.

WEDNESDAY, MAY 27TH.

THE Council resumed its sittings at its offices, 299, Oxford-street, W. Sir DONALD MACALISTER, the President, was in the chair.

Penal Cases.

The Council proceeded to hear complaints against practitioners.

The first case to be heard was that of Haripado Chatterjee, registered as of 1, East View, South Moor, Stanley, co. Durham, L.R.C.P. & S. Edin. and L.R.F.P.S. Glasg., 1910, who had been summoned to appear before the Council on the following charge:—

> That, being a registered medical practitioner, you, in the year 1913, accepted the post of medical officer of an association known as the South Moor Medical Association in the knowledge that such association had through its officials, by widely distributed circulars, by personal canvassing, and by solicitation of members of the miners' union in the South Moor district, sought to secure members of such association who, on joining it, would become the patients of the medical officer thereof. And further that you have by public speaking in the South Moor district and by advertising in such speeches your own qualifications taken a prominent part in inducing and endeavouring to induce persons to join the said association and so to become your patients. And further that throughout the year 1913, knowing that you were being advertised in the South Moor district as the doctor of the said association, you acquiesced in such advertising and continued to be employed as its medical officer. And that in relation thereto you have been guilty of infamous conduct in a professional respect.

The complainants were the British Medical Association. They were represented by Mr. W. E. Hempson, solicitor.

Mr. Chatterjee attended, and was also represented by Mr. R. Strother Stewart, solicitor.

All members of the Council who were also members of the British Medical Association withdrew from the hearing of this case.

Mr. HEMPSON, in opening the case for the complainants, said that he had four cases to present to the Council this session which had many features in common. In all these cases he represented the British Medical Association. He wanted to lay stress upon that, because there were no other complainants in the matter. The sole complainants were the British Medical Association, who in the interests of the medical profession brought forward these cases which they thought merited the consideration of the General Medical Council. These cases had relation to medical aid institutions which were governed by a lay body. He should put before the Council the question whether it was possible for these institutions to be formed without the aid of canvassing and touting for patients. So far as he was concerned he had never known one. In all the cases which he would submit to the Council he would submit evidence of this. A medical man whose conduct was impugned in such a matter as this was bound to assure himself of the circumstances which existed anterior to his joining the institution. He ought to be put on his inquiry that he had thoroughly satisfied his mind that the association to which he was asked to attach himself was not one which had been formed by methods of canvassing and touting for patients. Recent legislation had altered the conditions of medical practice very considerably. He did not know whether that tended to the interest of the profession or not. It would be found in these cases which would be brought before the Council that they were due almost entirely to the altered condition of things which had caused these institutions to spring up to defeat the direct purposes of recent legislation. He wanted to bring certain circumstances before the Council. One practitioner would no doubt say: "I am extremely sorry that there should have been canvassing and touting by which this Association has been built up. I did not know of it. Now I have had it brought to my knowledge, I shall take such steps as are in my power to prevent it recurring in the future." But was such an attitude as that sufficient? He would put it to the Council that in such a case the practitioner would be taking the fruits of what had been done. If a practitioner in such a case were allowed to remain in that position unchecked, he (Mr. Hempson) would submit to the Council that that was a direct encouragement for others to do the same in regard to similar institutions, and to continue doing so. Some other practitioners would admit the fault that had occurred, and would show some repentance in regard to it by dissociating themselves from the institution of which complaint had been made. Provided they continued to practise in the immediate locality they were taking to themselves the fruits of what had occurred under circumstances which he would submit to the Council should merit its disapproval. It could not be said that medical men were without warning as to the risks which they ran. They had had warnings repeated by the Council and made known through medical journals. If a medical man had any doubts as to the circumstances in which any particular institutions had been formed he should make the fullest and most thorough inquiry so as to satisfy himself before he accepted an office that he could hold it without bringing any just professional disapproval upon himself. Mr. Hempson went on to say that he would now proceed to deal with the case which affected Mr. Chatterjee. The charge was in three parts. The first was concerned with his acceptance of a post in connexion with the South Moor Medical Association with the knowledge that that association had canvassed for patients; the second was that Mr. Chatterjee had by speaking in the South Moor district sought to attach patients to himself; and the third was that he knew during the year 1913 that he was being advertised, and yet he continued to hold the appointment. So far as he knew there was no evidence that Mr. Chatterjee proposed to do anything but hold the appointment. The association was formed early last year for the purpose of obtaining for workmen medical attendance at a reduced rate which, he believed, was to be 6*d.* instead of 9*d.* There was not the slightest doubt that taking all the evidence together there was a wide canvass in order to advertise the formation of this association. A circular or notice had been distributed. Mr. Chatterjee accepted the post of medical man under this association. He also went on the panel, and he (Mr. Hempson) was instructed that the amounts he received as a panel practitioner were to be credited in aid of the salary of £350, which was to be given to him. That was an extraordinary position from the point of view of the medical profession. It was also stated that later on there had been a distribution of transfer forms. Mr. Chatterjee's answer to the whole case was that he did not know that there was anything going on in the nature of canvassing. It was also the case that he had addressed two meetings. At one of the meetings he had given particulars as to what his past had been, where he had qualified, and with whom he had served. He went on to say that he was inferior in no way to any man in the locality.

Dr. JOHN CHARLES, of Stanley, was then called as a witness. In his declaration he stated that he had been in practice in the district for 18 years. Since the Insurance Act came into operation there had been an acute difference in the district, and the object of the South Moor Medical Association was to get medical attendance at a reduced rate, and workmen were asked to give it their support. A form or circular was sent out notifying the formation of the new association. Two medical men were advertised for, and Mr. Chatterjee was one of those appointed. The two meetings which Mr. Chatterjee attended were reported in the press. Posters were placed at the pithead intimating the hours of Mr. Chatterjee. In this way the existence of the association was kept before the workmen.

Cross-examined by Mr. STEWART, Dr. CHARLES admitted that anonymous letters had appeared in the local press commenting on the association and its doctors. He admitted further that he had written one.

It was a letter attacking the doctor that was coming?—No.

What was it then?—It was advice to the miners to take a broad view of the position and see it according to their trade union principles.

Had not Mr. Chatterjee's speech reference to that letter? If the speech is read properly is it not a reply to it?—Not at all. The letter was brought up because it condemned the policy of the association.

What you say were posters, were they not merely cards intimating the hours?—I say posters or cards.

Mr. HEMPSON then put in the joint statutory declaration of Mr. William Arthur Benson and Mr. Reginald Edward Ingram Johnson, registered medical practitioners.

HENRY PRATT, miner, South Moor, then gave evidence. In his declaration he stated that when the Insurance Act came into operation there was an agitation to reduce the fortnightly deductions at the colliery from 9*d.* to 6*d.* A large number of workmen were induced to take Mr. Chatterjee rather than the old practitioners.

Mr. STEWART (cross-examining): Was not the circular issued before Mr. Chatterjee came to the neighbourhood?—Yes.

What do you mean by saying that a circular was issued by the local lodge in support of Mr. Chatterjee?—It was in support of Mr. Chatterjee or anyone else who might come.

Then Mr. Chatterjee was never thought of then? There was no association then?—No, the idea was to form an association.

And Mr. Chatterjee did not come until the association was formed?—No; he did not come until it was formed.

The PRESIDENT: Can you tell us how long before he came it was that the circular was issued?

WITNESS: About a month.

Do you know of any canvassing after Mr. Chatterjee came?—No; not after he came.

In answer to further questions put by the PRESIDENT witness stated that formerly 9*d.* had been deducted from the miners' wages every fortnight. It was devoted to paying medical attendance on the miner and his family. After the Insurance Act the miner for his insurance contributions got medical attendance for himself. The 6*d.* was offered for attendance on his wife and family who were not insured.

Replying to the PRESIDENT, Mr. HEMPSON said that Mr. Chatterjee went to South Moor on April 2nd, 1913.

Some further evidence was called in support of the complaint.

Mr. STEWART addressed the Council on behalf of Mr. Chatterjee. He said that when the National Insurance Act came into operation many of the miners who had been in the habit of paying 9*d.* a fortnight for medical attendance on themselves, their wives, and families, came to the conclusion that they ought to obtain a reduction of the contribution. They reckoned that the medical man would get 6*s.* 6*d.* each a year for perhaps two insured members of the family, and drugs would also be supplied to them. They considered that this would mean a very considerable addition to the fees of the local medical men. The miners thought that they themselves should get the benefit of 3*d.* a fortnight. The medical men were approached, but they had objections to anything of that sort. When the medical men would not agree to their proposals the miners came to the decision that the deduction of 9*d.* from their wages should cease. The management of the mines declined to do this until they had the signatures of the miners on slips directing the deduction to cease. That was one step in the miners' negotiations with the doctors. They thought that then they would be in a position to negotiate for a lesser fee. The miners then set collectors to collect the sixpence. The sum collected in this way soon went away in providing medical attendance. It was then thought that they should invite a medical man into the district to serve them for the sixpenny rate. All this took place before the association was formed. When they found that there was sufficient to guarantee a salary to a medical man they advertised for one. Mr. Chatterjee applied and took up the appointment on April 2nd, 1913. He could not have had any idea what had gone on in the past. He told the committee of the association that there must be no canvassing. The association were to make no profit out of the arrangement. Now as to the meetings which were held some days after Mr. Chatterjee came to the district, the Council already was informed that there was a very strong agitation in the locality, and considerable prominence had been given to it in the local papers. Some very harsh things were being said, and the Council had already heard from Dr. Charles of his letter to the press. If Mr. Chatterjee's speech was read it would be seen that he was replying to it. He went to speak at what he believed were meetings of his subscribers. There was no evidence before the Council that there were anyone but subscribers there except some reporters. Mr. Chatterjee's statements about his qualifications and where he got them from were made to contradict statements which were flying about all over the district. Taken in view of the circumstances everyone could see that it was natural that Mr. Chatterjee should defend himself. As he thought that he was addressing his own subscribers he let himself perhaps go further than he would otherwise have done. He denied that advertising was going on and that he acquiesced in it. The evidence before the Council was not sufficient to support the charge.

Mr. CHATTERJEE gave evidence in his defence. In the course of his declaration he stated that he found that statements were being made about him, and he replied to the letter at the meeting. He thought that he was then speaking to subscribers. His committee assured him that no canvassing was going on. He told the committee that there must be no canvassing, and he had no reason to believe there was. If any canvassing had taken place it had not his sanction.

Cross-examined by Mr. HEMPSON, Mr. CHATTERJEE said that when he found that a circular had been issued he took steps to find out about it. He found that it had been issued some time before he took the appointment.

Did it occur to you that it was not a proper appointment to hold?—I did not see that the circular had anything to do with any appointment.

What have you received in remuneration?—I have £350 a year, a house, a trap, and drugs.

Are you a doctor on the panel?—I have got panel patients.

How many panel patients have you got?—I have 958 panel patients.

What do you receive in respect of them from the Insurance Committee?—My last cheque was for £27 18*s*.

Was that a monthly cheque?—Yes.

You therefore have from your panel patients approximately £335 a year?—It might come to that.

The amount which you receive on behalf of your panel patients is a credit to the amount which you receive for your salary?—Yes.

Mr. CHATTERJEE went on to say that the drug bill which came to a considerable amount was paid by the association. He was to get an increase of salary as the funds of the association permitted it.

Mr. JOHN REECE, checkweighman, gave evidence regarding the formation of the association. He stated that the circulars or forms were returned before March 21st, and that ended the matter so far as the association was concerned. It was from them that those concerned with the association knew that they had enough money to form it and guarantee a salary to a medical man.

Answering the PRESIDENT, witness said that those directing the association had promised to pay the whole of their fund in salary to their medical man after paying the reasonable expenses of the association. All the surplus was to be handed over to the doctors over and above the stated salary. This year they were guaranteeing £400, and they would also give the whole of the surplus. They paid for house, horse and trap, and for the drugs required for wives and families.

The PRESIDENT: It is not the intention of your association to retain any profit.

WITNESS: No; we have that thoroughly understood.

After the hearing of some further witnesses the evidence was concluded.

The Council adjourned.

THURSDAY, MAY 28TH.

The Council resumed its sittings at its offices, 299, Oxford-street, W. Sir DONALD MACALISTER, the President, was in the chair.

Penal Cases.

The Council considered *in camerâ* the case of Mr. Haripado Chatterjee, evidence in regard to which had been heard at the previous sitting.

The PRESIDENT, in announcing the decision of the Council, said: Mr. Chatterjee, I have to inform you that the Council has carefully considered the facts alleged against you in the notice of inquiry, and has found that the following fact has been proved—viz., that you have by public speaking in the South Moor district and by advertising in such speeches your own qualifications taken a prominent part in inducing and endeavouring to induce persons to join the said association and so to become your patients; but that the Council has suspended judgment till the November session when you will be required to be present and to produce evidence as to your professional conduct in the interval, and as to the methods of the association under which you have accepted employment. All the other facts alleged in the notice of inquiry have not been proved to the satisfaction of the Council.

The Council considered the case of Alexander Girvan, registered as of 8, Palace-street, Buckingham Gate, London, S.W., M.B., C.M. 1894, M.D. 1904, U. Glasg., who had been summoned to appear before the Council on the following charge:—

> That being a registered medical practitioner, you were on Dec. 4th, 1913 (after having elected to be dealt with summarily), convicted at the Westminster police court of unlawfully and wilfully making a certain false declaration under and for the purposes of a certain Act relating to the registration of deaths, and fined £10 and £10 costs.

Dr. Girvan attended. He was represented by Mr. George Elliot, K.C., Mr. H. W. Wickham, and Mr. Arthur Bryan, counsel who were instructed by Messrs. Walton and Hurd, solicitors.

Mr. HARPER, the Council's solicitor, brought to the Council's notice circumstances connected with the conviction. He said that the certificate given by Dr. Girvan in this case showed that the cause of death was primarily appendicitis and secondarily peritonitis and cardiac failure. The patient, however, had to the practitioner's knowledge, it appeared, a miscarriage while in a nursing home, and he had been asked by her not to tell her sister of her condition. The death of the woman in regard to which the certificate was given became the subject of a coroner's inquest. The jury found the cause of death to be heart failure and acute blood poisoning following a wound inflicted while unlawfully procuring abortion. The coroner's jury added to their verdict a rider that they thought the false certificate should be reported to the General Medical Council. Dr. Girvan in his defence said that he had omitted the word "miscarriage" without any improper motive and without intention to deceive, but in order to save the patient's honour. He also said that he did not know that an illegal operation had been performed, and that he had no suspicion that an illegal operation had been performed. There might be cases in which medical certificates did not state the whole cause of death. This case was different from them—a medical practitioner who suspected or ought to suspect that a crime had been committed yet gave a certificate which covered up that fact and prevented attention being drawn to the possibility of crime. It was true that Dr. Girvan had himself reported the matter to the coroner, but only after he had been told by the relatives that they were going to the coroner.

Dr. BERNARD HENRY SPILSBURY was called as a witness and he stated that he had made a post-mortem examination on the body on Oct. 3rd, 1913. He had given evidence at the inquest and again at the magisterial inquiry. There was peritonitis and three wounds. He came to the conclusion that the wounds were caused by the use of some instrument to procure abortion.

In answer to the PRESIDENT, Dr. SPILSBURY said that he thought that before the post-mortem examination the cause of death might have been uncertain. There ought to have been a suspicion as to the possibility of something improper having been done.

Dr. ALEXANDER GIRVAN then gave evidence in his defence. Examined by Mr. George Elliott, K.C., he said that during the 18 years he had been in the medical profession, with the exception of this unfortunate incident, no shadow of reproach or blame had rested on him. He had always upheld the high ideals of the profession in every way. The patient in regard to whom these proceedings had arisen consulted him at his house on August 8th, 1913. She complained of certain pains and told him that she had had an operation for appendicitis. He prescribed for her. She consulted him later. On Sept. 25th she called in the morning when he was out, but he saw her after he returned home. He found that she was in a certain condition. She was very anxious that it should not be discovered. She refused to go into hospital and he sent for a nurse from a nursing home. He had asked her whether she had been illegally treated. She denied it. She denied it again to the nurse. He saw no symptoms to lead him to believe that she had been illegally treated. She was sent to the nursing home where she became worse. The witness described her illness. On the day of her death he was describing the case to a consulting surgeon when the nurse came and said that she had died. He was justified then in thinking that appendicitis had set up peritonitis.

Mr. HARPER: Did you see any reason not to believe the statement of the girl that there had been no illegal operation?

Dr. GIRVAN: I saw no reason to disbelieve her.

Miss EMILY CARTER, a certified nurse, gave evidence as to attending the patient. Dr. Girvan had asked the patient whether she (the patient) had had anything done to her. The patient had said "No." She (Miss Carter) had impressed upon the patient that it was important for her to say whether anything had been done to her, and she denied that there had been.

In answer to the Legal Assessor (Mr. BODKIN), witness said that the patient was very anxious that nothing should be known about her miscarriage, which took place in the nursing home.

Mr. ELLIOTT addressed the Council on behalf of Dr. Girvan. Dr. Girvan, he said, had no desire to go behind his own admissions for a single moment or to attempt to shield himself so far as the omission of the word "miscarriage" or any other words was concerned. All that he desired the Council to do was to ask it to look at all the surrounding circumstances of the case, and to submit to the members whether in view of those surrounding circumstances it was a case calling for any severe or harsh decision. In similar circumstances he would not dream of acting again as he had in this case. Dr. Girvan was undoubtedly moved by his promise to this girl to shield from the knowledge of the family all the facts of her being in the condition in which he discovered she was, with a view to protecting her honour and reputation. He could only leave the case to the merciful consideration of the Council. It could not come to the conclusion that he had been actuated by improper motives. The circumstances should certainly call for the lenity of the Council.

The PRESIDENT, in announcing the decision of the Council, said: Mr. Alexander Girvan, I have to inform you that the Council has found your conviction for the misdemeanour alleged against you in the notice to have been proved; that the Council takes the gravest view of the offence of which you have been convicted; but that, having regard to the punishment which you have already received, the Council has suspended its judgment until the November session, when you will be required to attend and to produce evidence from medical men and others that in the interval your professional conduct has been without reproach.

The Council then considered the report of the Dental Committee on the case of Valleck Cartwright Mallan. The committee found that the following facts were established by the evidence:—

The said Valleck Cartwright Mallan was registered in the Dentists Register on Dec. 6th, 1878, as "In practice on July 22nd, 1878," and his address in the Register for the current year is 106, Edgware-road, London, W.

The said Valleck Cartwright Mallan practises at 106, Edgware-road, aforesaid, and issues and distributes as widely as he can a card and an explanatory pamphlet advertising his practice. The card contains a number of illustrations of American plateless teeth; the pamphlet enlarges upon the advantages of consulting the said V. C. Mallan and contains a photographic reproduction of a newspaper paragraph on the long-standing reputation of the said V. C. Mallan and his family since the beginning of the nineteenth century. The said V. C. Mallan stated that the paragraph appeared in the *Catholic Times*, and was not an advertisement, although he advertises in that paper. The complainants also submitted a two-column article which had appeared in the *Hampstead Advertiser* of July 17th, 1913, containing a portrait of the said V. C. Mallan, and a photograph of a challenge cup which he had presented in connexion with local cricket. The said article contained a lengthy and puffing description of the said V. C. Mallan as a dentist as well as a public man interested in the public affairs of Marylebone. The complainants did not offer any proof that the said V. C. Mallan was responsible for this article, but he admitted in answer to questions that he had been interviewed by the *Hampstead Advertiser* and had given the information, some of which was untrue, therein contained, that although he had not paid for it he had subscribed for 100 copies which he had sent out to various people, and that he had in fact used the article as an advertisement for his practice.

At the conclusion of the inquiry before the Dental Committee the said V. C. Mallan offered to give an undertaking that in future he would not advertise in any form of which the Council disapproved.

The complainants, the British Dental Association, were represented by Mr. R. W. Turner, counsel instructed by Messrs. Bowman and Curtis-Hayward, solicitors.

Mr. MALLAN, who attended, addressed the Council and complained of the methods adopted by unregistered dentists to advertise their business. He repeated his assurances that he would not advertise in future in any form of which the Council disapproved.

The PRESIDENT announced the decision of the Council as follows:—Mr. Mallan: The Council have considered the report of the Dental Committee in regard to the facts proved against you, and they have considered the undertaking which you have given that in future you will not advertise in any form of which the Council disapproves. The Council has deferred the further consideration of your case to the November session, when you will be required to be present and to produce satisfactory evidence as to your conduct in the interval, with particular reference to the manner in which you have carried out the undertaking regarding advertising which you have given to the Council.

The Council considered a report of the Dental Committee in regard to the case of John Winter. In their report the committee found that the following facts were established by the evidence:—

The said John Winter was registered in the *Dentists Register* on January 19th, 1888, as "In practice on July 22, 1878," and his address in the Register for the current year is 26, West Parade, Lincoln.

The said John Winter practises at 28, West Parade, Lincoln, and resides at High-street, Mablethorpe, Lincolnshire, where he also practises. He has a son, J. G. Winter, who resides at 28, West Parade, Lincoln, and there practises dentistry in the same premises as his father, but he is not on the *Dentists Register*. The said J. G. Winter practises in the name of his father, and the said John Winter covers the practice of his son.

Advertisements of the practice of "J. Winter" appear in the local press both at Lincoln and at Mablethorpe. A circular in the name of J. Winter, giving the Lincoln address, was handed to a patient at the Lincoln consulting room, who was being treated by J. G. Winter in the name of the said John Winter. The name of J. G. Winter nowhere appears except on a brass plate affixed to the wall of the Lincoln premises.

The complainants were the British Dental Association, who were represented by Mr. R. W. Turner, counsel.

Mr. Winter did not attend.

The PRESIDENT, addressing Mr. Turner, announced the decision of the Council as follows: I have to announce to you that on the facts found in the report of the Dental Committee it has been proved that John Winter has been guilty of infamous and disgraceful conduct in a professional respect, and that the Registrar has been directed to erase from the Dentists Register the name of John Winter."

The Council considered the report of the Dental Committee on the case of John William Whitehead.

In the report the committee found that the following facts were established by the evidence:—

The said John William Whitehead was registered in the Dentists Register on Sept. 13th, 1878, as "In practice on July 22nd, 1878," and his address in the Register for the current year is 10, Bellevue-street, Burnley.

The said John William Whitehead was convicted as follows: On May 14th, 1904, at Church, Lancashire, of unlawfully laying a certain pipe to communicate with another pipe belonging to the urban district council of Oswaldtwistle without their consent, contrary to the provisions of the Gasworks Clauses Acts, 1847, and was fined £1 and £1 2s. costs, or 14 days. (Note.—This offence, in non-technical language, consists in tapping the gas main of the local authority and stealing the gas.) On Jan. 22nd, 1906, at Blackburn, Lancashire, of feloniously stealing 13 books, the property of the borough of Blackburn, and was sentenced to one month's hard labour. On Feb. 24th, 1906, at Accrington, Lancashire, of feloniously stealing three books, the property of the borough of Accrington, and was sentenced to one month's hard labour.

At the end of 1904 the name of the said John William Whitehead had been erased from the Dentists Register under Section 12 of the Dentists Act. He applied in 1912 for restoration. The Executive Committee was advised that this request should be complied with, but the Registrar was directed to inform the said John William Whitehead that in the event of restoration an inquiry would be held in regard to the convictions. Notwithstanding this intimation he renewed his application and his name was restored.

The Registrar then wrote several times to the accused for an explanation of his conduct, and eventually received the following:—

"10, Bellevue-street, Burnley,
March 18th, 1914.

(No. 35651).

To the REGISTRAR, GENERAL MEDICAL COUNCIL.

RESPECTED SIR,—With reference to the convictions mentioned in your letter bearing the above number, I regret to say that I have no explanation to offer, only that I am very sorry, and if the Council can see fit to excuse me this time I shall ever feel thankful to them, and promise that no similar offence shall occur again.

Believe me to be, yours humbly and faithfully,

J. W. WHITEHEAD."

The said John William Whitehead has therefore furnished no satisfactory explanation of his convictions, nor has he offered any evidence of his conduct since 1906.

Under Section 13 of the Dentists Act, any person who has either before or after he is registered been convicted of a felony or misdemeanour shall be liable to have his name erased from the Register, provided that the name shall not be erased "on account of a conviction for an offence which does not either from the trivial nature of the offence or from the circumstances under which it was committed disqualify a person for practising dentistry."

The misdemeanour and felonies in respect of which the said John William Whitehead was convicted can be considered by the Council as sufficient to entitle the Council to erase his name from the Register.

Mr. Whitehead did not attend.

The PRESIDENT announced the decision of the Council to Mr. Harper, the Council's solicitor, as follows: I have to tell you that John William Whitehead having been proved to have been guilty of the two felonies and the misdemeanour set forth in the report of the Dental Committee, the Registrar has been directed to erase from the Dentists Register the name of John William Whitehead.

The Council proceeded to the consideration of the case of William Samuel Daroux, registered as of Station-road, Stanley, co. Durham, L.A.H. Dub. 1910, L.R.C.S. Irel. 1911, who had been summoned to appear before the Council on the following charge:—

That being a registered medical practitioner you, in the year 1913, accepted the post of medical officer of an association known as the Stanley and District Workers' Medical Association in the knowledge that such association had through its officials, by widely distributed circulars, by personal canvassing, and by solicitation of members of the miners' union in the Stanley district, sought to secure members of such association who, on joining it, would become the patients of the medical officer thereof. And that throughout the year 1913, knowing that you were being advertised in the Stanley district as the doctor of the said association, you acquiesced in such advertising and continued to be employed as its medical officer. And that in relation thereto you have been guilty of infamous conduct in a professional respect.

Mr. Daroux attended, and was accompanied by Mr. R. Strother Stewart, solicitor.

The complainants, who were the British Medical Association, were represented by Mr. W. E. Hempson, solicitor.

When the Council's solicitor had read the notice,

Mr. HEMPSON said that Mr. Daroux had severed his connexion with the association mentioned in the notice and he was no longer its medical officer. Mr. Daroux had recognised his position as untenable. In these circumstances he (Mr. Hempson) wished to withdraw the case.

Mr. STEWART said that he took exception to this statement in so far as it was contended that Mr. Daroux's position was untenable. Mr. Daroux had severed his connexion with the association and had no intention of renewing it. But he did not admit that there had been canvassing as alleged in the charge. He was, subject to this being understood, ready to assent to the withdrawal of the charge.

After deliberation *in camera* the PRESIDENT said: The Council has considered the application of Mr. Hempson to withdraw the complaint and the charges made thereunder against Mr. Daroux and has assented to the application.

The Council adjourned.

FRIDAY, MAY 29TH.

The Council resumed its sittings at its offices, 299, Oxford-street. Sir DONALD MACALISTER, the President, was in the chair.

Penal Cases.

The Council considered the case of William Blaikie Mason, registered as of 218, Somers-road, Southsea, M.R.C.S. Eng. 1893, L.R.C.P. Lond. 1893, who had been summoned to appear before the Council on the following charge:—

That being a registered medical practitioner you on Nov. 1st, 1913, signed a certificate that one Patrick Matthews, of 46, Raglan-street, Southsea, was suffering from gastric colic and was unable to follow his occupation, whereas you had neither seen nor examined the said Patrick Matthews, which said certificate was untrue, misleading, or improper. And that in relation thereto you have been guilty of infamous conduct in a professional respect.

The complainants were the Lords Commissioners of the Admiralty, who were represented by Mr. C. R. Brigstocke.

Mr. Mason attended in person.

Mr. BRIGSTOCKE said that what he wanted to bring before the Council was this. At naval ports men were given short periods of leave. Since the fleet was concentrated in the home waters the practice prevailed far more than formerly. The men were inclined to outstay their leave. Matthews went on shore and was not heard of for two days. A certificate then arrived stating that he was unable to follow his occupation. The authorities ascertained later that Mr. Mason had not seen the man before he granted the certificate. They felt that they had no check over men if they could procure certificates from medical men without being seen by those medical men. If they could not rely upon the certificates they were helpless. Mr. Mason had frankly admitted that he had not seen the man. The Admiralty had no desire to press the case personally against Mr. Mason, and their only object was to stop a practice under which such a thing could be possible.

Mr. MASON, addressing the Council on his own behalf, regretted that he had been led into granting the certificate. He had had no idea at the time that he was doing wrong. The circumstances under which he had given the certificate were these. The landlady of the man came to him and described the symptoms of the man's condition. He had formerly attended the man, and from what the landlady said he had no doubt that the man was suffering in the same way again. He gave him medicine. Afterwards the landlady, whom he knew as a respectable woman, returned and said that the man must have a certificate as he was not fit to go on board his ship in the morning. Without thinking he gave her the certificate. The certificate might be supposed to convey that he had seen the man. He was very sorry that he had given it. He would appeal to the Council not to take any further action against him. He realised now that he had done something wrong, and he promised that in the future he would not do it again. He made an unconditional promise never to give a certificate without seeing the person.

The PRESIDENT announced the decision of the Council as follows: Mr. William Blaikie Mason, I have to inform you that the Council has found that the facts alleged against you in the notice of inquiry have been proved; that the Council takes a very serious view indeed of the gravity of the matter; and that it has already marked its sense of the gravity of such offences by issuing in the medical journals and elsewhere in November, 1911, a warning notice as follows:—

Whereas registered medical practitioners are in certain cases bound by law to give, or may be from time to time called upon or requested to give, certificates signed by them in their professional capacity, for subsequent use either in courts of justice or for administrative purposes. And whereas such certificates include, *amongst others*:—

Certificates: (*a*) Under any statute relating to births, deaths, or disposal of the dead; (*b*) under the Lunacy Acts; (*c*) under the Vaccination Acts; (*d*) under the Factory Acts; (*e*) in relation to children or to excusing school attendance; (*f*) in connexion with sick benefit, insurance, and friendly societies; (*g*) in connexion with workmen's compensation; (*h*) in connexion with naval or merchant shipping; (*i*) for procuring the issue of Foreign Office passports; (*j*) for excusing attendance in courts of justice, in the public services, in public offices, or at ordinary employments.

And whereas it has been made to appear to the General Council from time to time that some registered medical practitioners have given and signed untrue, misleading, or improper certificates of the above-specified or other descriptions.

Now, therefore, the General Medical Council hereby give notice that any registered medical practitioner who shall be shown to have given any untrue, misleading, or improper certificate, *whether relating to the several matters above specified or otherwise*, is liable to be adjudged by them to be guilty of "infamous conduct in a professional respect" and to have his name erased from the Medical Register under Section 29 of the Medical Act, 1858.

In order to give you an opportunity to prove to the Council that you realise the gravity of your offence, and to produce evidence from your professional brethren regarding your character and conduct generally, the Council has postponed judgment till the November session, when you will be required to produce testimony to the effect above specified and to your conduct in the interval.

The PRESIDENT then informed Mr. Brigstocke that he would have an opportunity of appearing before the Council in November, when he could produce any further evidence in regard to Mr. Mason's conduct in the interval which the Lords Commissioners of the Admiralty might think fit. He also requested Mr. Brigstocke to convey to the Lords Commissioners the thanks of the Council for bringing the case to its notice, and for allowing him to be present to conduct it.

The Council considered the case of Michael Joseph Ryan, registered as of 106, Newport-street, Bolton, L.R.C.S. Irel. 1885, L., L.M. 1886, K.Q.C.P. Irel., who had been summoned to appear before the Council on the following charge:—

That being a registered medical practitioner you were at the assizes held at Manchester and commencing on Nov. 17th, 1913, convicted of unlawfully making false certificates purporting to be made under the Births and Deaths Registration Act, 1874, knowing same to be false, and sentenced to six months' imprisonment in the second division.

Mr. Ryan attended in person.

Mr. HARPER, the Council's solicitor, stated that Mr. Ryan had written out these false certificates on official forms.

Mr. RYAN addressed the Council on his own behalf.

The PRESIDENT announced the decision of the Council as follows:—Mr. Ryan: I have to inform you that you have been proved to have been convicted of the misdemeanour alleged against you in the notice of inquiry, and that the Registrar has been directed to erase your name from the Medical Register.

The Council then considered the case of William Young, registered as of 13, Elliott-terrace, Usworth, Durham, M.B., Ch.B., 1902, U. Edin., who had been summoned to appear before the Council on the following charge:—

That being a registered medical practitioner you, in the year 1913, accepted the post of workmen's doctor for Usworth Colliery, Durham, in the knowledge that a number of the members of the Miners' Union had been canvassed in your interest by the officials of the local branch of the said union at Usworth with a view to their becoming your patients, and that you having been appointed such doctor for the Usworth Colliery miners knowingly exhibited and caused and permitted to be exhibited at Usworth Colliery and at Washington Colliery notices signed by you inviting and soliciting persons to become your patients; and that in relation thereto you have been guilty of infamous conduct in a professional respect.

The complainants, the British Medical Association, were represented by Mr. W. E. Hempson, solicitor.

Mr. Young attended and was represented by Mr. P. Lloyd-Graeme, counsel instructed by Messrs. Rawle Johnstone and Co., solicitors acting for Messrs. Newlands and Newlands, Newcastle-on-Tyne.

Mr. HEMPSON stated that Mr. Young took up his appointment in May, 1913. A number of notices in regard to which the complaint was made emanated about October or November. Some notices were issued in public places where miners and others had an opportunity of reading them and therefore had an opportunity of becoming the patients of Mr. Young.

Dr. WILLIAM JAQUES, Naworth House, Washington, was the first witness. In his statutory declaration he stated that previous to January, 1913, deductions were made from the pay of miners at the rate of 9*d.* per fortnight for medical attendance to themselves and family. The miners' representatives after the Insurance Act came into operation wanted the rate to be reduced to 6*d.* The practitioners affected refused to accept the lower sum. No agreement was arrived at, and he was informed that the workmen were urged not to pay at the old rate. In April, 1913, a ballot was taken at the Usworth Colliery. The majority of the miners decided that the contribution should be reduced from 9*d.* to 6*d.*, and a new doctor was advertised for at a salary of £375. Mr. Young was appointed. He understood that over 600 names were put on his list. In his (Dr. Jaques's) opinion such a large number of patients could not have been obtained without canvassing. On the revision of the lists of panel patients in October, 1913, he was informed that various steps had been taken to urge workmen to sign these forms in favour of Mr. Young. A circular in regard to the Insurance Act was sent out by the miners' committee. It mentioned Mr. Young's ability and attention, and it said that the workmen now had a doctor of their own who was entitled to their loyal support. They were urged not to let the opportunity to transfer slip, because it would be 12 months before they had another. The circular was signed by W. P. Richardson on behalf of the committee.

Cross-examined by Mr. LLOYD-GRAEME, Dr. JAQUES admitted that the miners were accustomed frequently to take joint action through their trade union. He admitted also that perhaps three-quarters of the miners at Usworth village had been patients of his. He did not know that Mr. Young's appointment was approved by a meeting of the miners' lodge.

You do not wish to say that a large number of those who voted for a doctor would not naturally wish to employ the doctor who was appointed?—That would depend.

DANIEL HAMILTON, miner, Washington, stated that he had seen a notice in the miners' hall telling workmen who wanted Mr. Young to attend them what to do.

Mr. HEMPSON: Is there any doubt that these were signed by Mr. Young?

Mr. LLOYD-GRAEME: I admit that.

Several other witnesses were called and examined.

The Council then adjourned.

SATURDAY, MAY 30TH.

The Council resumed its sittings at its offices, 299, Oxford-street, W. Sir DONALD MACALISTER, the President, was in the chair.

Complaint Against Practitioner Dismissed.

Consideration was resumed of the complaint against Mr. William Young, M.B., Ch.B., the hearing of which was commenced on the previous day. The case for the defence of the practitioner was taken.

Mr. W. P. RICHARDSON, secretary to the Usworth branch of the Durham Miners' Association (examined by Mr. LLOYD-GRAEME), explained the demand on the part of the miners for a reduction of their fortnightly contributions from 9*d.* to 6*d.* A circular and a ballot paper were sent out in order to test the support which would be given for the employment of another medical man. There was no intimidation to compel the men to vote one way or other. 700 or 800 voted for it and 50 against. After the result of the ballot he was instructed to advertise for a doctor at a salary of £375 a year plus maternity fees. There were 14 applications for the post. Mr. Young was appointed, and a large number of the men at Usworth colliery took him for their doctor.

Have you ever exercised any compulsion on the men to take Mr. Young?—No.

Witness went on to say that the agreement with Mr. Young had nothing to do with the Insurance Act. He was to have the £375 for attending the wives and families of the men.

The PRESIDENT: That amount had nothing to do with the amount of his insurance money?—Nothing to do with it.

If he had 500 panel patients he would get paid out of the insurance funds for them, and he would get £375 over and above for the wives and children.—That is so.

Further examined by Mr. LLOYD-GRAEME, witness said that the circular which he signed was issued in view of the inquiries of members at the lodge meeting when the change of doctor was to take place. He was instructed to get it printed.

Did you ever show a copy to Mr. Young?—Never.

Did you ever discuss with Mr. Young what was to be put into this circular?—No.

Did you ever tell Mr. Young that such a circular was to go out?—No.

Throughout the whole of this transaction has your lodge acted in the way it usually acts as to its business?—Yes.

Have you ever heard Mr. Young canvass? Have you ever seen him ask any person to become his patient?—No.

Cross-examined by Mr. HEMPSON, witness said that the £375 was to cover attendance to wives and families, and to cover what the men would not get as panel patients. It was to cover such things as compensation notes or certificates, which the men did not receive as panel patients under the Insurance Act. They wanted these particular services for an inclusive fee.

JOHN CURRAN, of Washington, stated that numerous inquiries had been made at Washington how people could take Mr. Young as their doctor.

J. G. FLETCHER, miner, Usworth, also stated that inquiries were made by the Washington men how they could obtain Mr. Young's services. Mr. Young on being approached declined to go to a meeting and address it. He asked Mr. Young to give him something in writing to show what the Washington men would have to do to obtain his services. Mr. Young wrote something at his request.

Mr. WILLIAM YOUNG then gave evidence on his own behalf. Before he went to Usworth he knew nothing of the ballot. He knew nothing at all about the drawing up of the circular about the insurance in October, 1913, in which his name came in several times. He did not at the time know that any circular had been sent out.

Mr. LLOYD-GRAEME: Have you ever been asked by Washington men whether it would be possible for you to attend them?—Yes.

Witness went on to say that he had declined Fletcher's request that he should address the Washington men. That would have been too much like canvassing and puffing himself. Fletcher had afterwards said that he wanted something from him to show them as to how they could go about having him for their doctor. He admitted giving Fletcher the notices, but he intended merely to let those men who wanted to come to him know how to do so. He did not intend in any way to canvass. He had never attempted to get patients away from another doctor.

Cross-examined by Mr. HEMPSON, Mr. YOUNG denied that he had any intention that the notices he had given to Fletcher should be put up in public.

In answer to the PRESIDENT, Mr. YOUNG said that when the insurance circular of October came to his notice he secured the 500 or 600 which had not been issued and had torn them into small pieces.

Mr. LLOYD GRAEME and Mr. HEMPSON reviewed the evidence.

The PRESIDENT, in announcing the decision of the Council, said: Mr. William Young, I have to inform you that the facts alleged in the notice of inquiry have not been proved to the satisfaction of the Council, and the complaint is accordingly dismissed.

The Council adjourned.

MONDAY, JUNE 1ST.

The General Medical Council resumed its sittings at its offices, 299, Oxford-street, W., the President, Sir DONALD MACALISTER, in the chair.

Penal Cases.

The Council considered the case of Edward Nangle Smartt, registered as of Leven, Hull, L.R.C.S. Irel. 1884, L.K.Q.C.P. Irel. 1886, who had been summoned to appear before the Council on the following charge:—

> That being a registered medical practitioner you have sought to attract to yourself patients by canvassing in person and by an agent for subscribers to a private medical club instituted by you, and by sending out to persons who were not your patients a printed circular letter signed by you offering your services in connexion with such club, and intimating that your secretary would call on the recipient. And that in relation thereto you have been guilty of infamous conduct in a professional respect.

The complainants were the British Medical Association, represented by Mr. W. E. Hempson, solicitor.

Mr. Smartt attended and was represented by Mr. H. Dobb, counsel instructed by Messrs. Petch and Co. (for Messrs. Crust, Todd, Mills, and Sons, Beverley).

Mr. HEMPSON said that prior to the National Insurance Act Mr. Smartt had acted as medical man to certain local clubs. These owing to the Act coming into operation were disbanded, but there were in connexion with these clubs certain classes of persons who did not get the benefit of the Insurance Act. Mr. Smartt, it appeared, was approached by the representatives of these people and asked to form a private medical club, and a circular had been sent out in connexion with the matter. Mr. Smartt now regretted that by an error of judgment he had caused his fellow practitioners annoyance. If that was still his attitude the British Medical Association had no desire to press the matter harshly.

Mr. SMARTT, giving evidence on his own behalf, said that a large proportion of his practice had been with clubs, and there had been no complaint against him. He had been on the best of terms with his fellow practitioners. When the Insurance Act came into operation he was approached by the secretaries of the clubs and also by members in regard to the difficult position in which the uninsured members found themselves. A suggestion was made that a private club should be formed to take these uninsured members. He consented to assist in forming it, and he was partly responsible for drafting the circular. The other persons responsible were the secretaries of the clubs. The object of the circular was to intimate to the uninsured members of the clubs that they would be provided for as a whole. He got lists of the uninsured members of the four clubs of which he had been the doctor. He had only sent out the circular to the people in those lists. They were all members of the clubs to which he was the medical attendant. He found them all in his books. He expressed regret that he had caused his fellow practitioners so much annoyance. He was getting in all the circulars which he could recover.

Mr. DOBB suggested that in view of Mr. Smartt's statement the complaint should be withdrawn by Mr. Hempson.

Mr. HEMPSON: I think I should leave it to the Council.

Mr. BODKIN (the legal assessor): You do not dispute the frankness of Mr. Smartt's attitude?

Mr. HEMPSON: Not in the slightest.

The PRESIDENT, in announcing the decision of the Council said: Mr. Smartt, I have to inform you that the Council have found that the facts alleged against you in the notice of inquiry have been proved to their satisfaction, but they have considered the explanations and apologies you have offered as coming in good faith, and accordingly they have not seen fit to direct the Registrar to erase your name from the Medical Register.

The Council considered the case of Caspar Denis Downing, registered as of 47, Mount Pleasant-square, Ranelagh, Dublin, L.A.H. Dub. 1912, who had been summoned to appear before the Council on the following charge:—

> That being a registered medical practitioner you were convicted: On Feb. 22nd, 1913, at the city police-court, Liverpool, of being guilty while drunk of disorderly behaviour in Windsor-street, Liverpool; (2) on August 2nd, 1913, at the city police-court, Liverpool, of being guilty while drunk of disorderly behaviour in Boundary-street, Liverpool; and (3) on Dec. 13th, 1913, at the Inns-quay police-court, Dublin, of being found drunk in a highway.

Mr. Downing did not attend.

Mr. HARPER, the Council's solicitor, read letters from the practitioner to the effect that he had been suffering from depression at the times the offences were committed. He had never been in practice in either Liverpool or Dublin. He had now an appointment in the extreme West of Ireland.

The PRESIDENT, in announcing the decision of the Council, said: I have to state that the Council have found that the convictions alleged against Mr. Caspar Denis Downing in the notice of inquiry have been proved to their satisfaction, but the Council have postponed announcing judgment on these convictions until November next, when Mr. Downing will be required to attend in person and to produce satisfactory evidence of his conduct in the interval.

Midwives (Scotland) Bill.

The Council received *in camerâ* a report from the Executive Committee on the Midwives (Scotland) Bill.

When the sitting was resumed in public

The PRESIDENT said: The Council has considered the Midwives (Scotland) Bill, and I am asked to communicate to the Lord President of the Privy Council the following resolution:—

> That the General Medical Council expresses its approval of the Bill and trusts that it will be passed into law in the current session.

Service Examinations.

Certain reports were presented by Sir CHARLES BALL from the Examination Committee. One of these dealt with the returns as to the examinations for the services. It set out that 25 commissions were offered in the Naval Medical Service in March, 1914. 24 candidates competed, 17 of whom passed, and 7 were rejected—4 in medicine, 2 in surgery, and 1 in both medicine and surgery. The Royal Army Medical Corps offered 12 commissions in January, 1914. 42 candidates entered for the examination, but only 34 competed. All qualified and 12 passed for vacancies. 12 commissions, afterwards increased to 20, were offered for competition in the Indian Medical Service in January, 1914. 22 candidates entered for examination, all qualified, and 20 passed for vacancies. The committee was glad to note the small number of rejections and the absence of any unfavourable criticisms on the general education of the candidates. There still appeared to be a serious shortage in the number of candidates for commissions in the Royal Navy.

Military Assistant Surgeons in India.

Sir CHARLES BALL presented a report from the Examination Committee on military assistant surgeons in India and Indian certificates. It was stated in the report that the military assistant surgeons formed a class which had undergone a modified medical training for a period of four years in one of the Indian colleges. The Council had permitted the recognition of this course under certain conditions as equivalent to three years of study in this country, but they had not sanctioned the acceptance of the preliminary and professional examinations connected with it. Sir Charles Ball went on to explain that certain communications had taken place with the Indian authorities, and two requisitions had now been made by the Indian Government. The one was that they recommended that the form of the certificate should be altered in certain ways, and the persons who certified that the certificates were granted should be altered to some extent. To these recommendations the committee gave unqualified approval. There were certain suggestions made by the Indian Government particularly as to certificates in preliminary education given by some of the colleges in India for which the Indian Government would be responsible, and they expressed the hope that these would be received so as to enable candidates who had passed them on commencing their professional studies over here to obtain admission to the Register. The conditions which had been laid down in a recommendation were that the examination in preliminary education of an Indian student should be of the character that would be accepted by the Indian universities for a similar purpose—those universities which were capable of granting a qualification capable of registration in the Colonial List. The committee thought that it would be extremely unwise to accord recognition to an examination held in India so as to admit a man to medical studies in this country, and the same examination was not recognised in India as admitting to study for a registered qualification there. The committee thought, therefore, that these examinations sanctioned by the Government of India should be also of a standard such as would be accepted by the Indian universities granting registrable diplomas.

The report was adopted and the Registrar was instructed to transmit it to the India Office.

Inspection of Examinations.

Dr. MACKAY presented the following report by the Education and Examination Committees acting conjointly in regard to the inspection of examinations :—

> The Examination Committee and the Education Committee acting conjointly advise the Council to commence in the year 1915 a cycle of inspection of the qualifying examination held by the several licensing bodies in the United Kingdom.
>
> They also recommend that members of the Council should be appointed to act as visitors.

Dr. Mackay said that it was the statutory duty of the Council to make an inspection of the qualifying examination of licensing bodies. It was practically ten years since the last cycle was undertaken. In the interval several new bodies had sprung into existence and they had not been inspected. From that point of view it would be the duty of the Council to undertake an inspection. It was necessarily a process which involved a certain amount of expenditure, but that could not be avoided if the Council was to perform its duties. The committees were of opinion that examiners were after all mortal, and it might be that there would be inspectors whose opinion would be dissented from by the examined body. It was therefore desirable that the Council should be represented and have an independent opinion. The visitors would be members of the Council who would be particularly qualified by training and experience to give the Council the benefit of their experience.

Sir CHARLES BALL then moved :—

> That it be delegated to the Executive Committee to make all the necessary arrangements for the inspection and visitation of qualifying examinations directed to begin in 1915, and to nominate to the Council at its November meeting suitable persons to be inspectors.

Dr. NORMAN MOORE seconded.

The motion was agreed to.

Recognition of Indian Preliminary Examinations.

Dr. MACKAY submitted a report of the Education Committee upon the recognition of certain preliminary examinations in India. He said that four of the universities of India required of their students that after passing the matriculation examination they should engage in further study in subjects of general knowledge for one or two years. There was usually additional study in English. The University of Calcutta did not adopt this system. If the Council were to accept the matriculation of Calcutta as absolutely sufficient they would be accepting an examination which would not be accepted by four of the Indian Universities. The Universities required the Calcutta matriculation examination to be supplemented by the intermediate examination or the preliminary scientific examination of the University. It was the usual practice of the General Medical Council to recognise only those examinations conducted by universities which the universities themselves accepted as sufficient for their own degrees; and the committee would therefore recommend that no Indian examination should be recognised as sufficient by the licensing bodies in this country which was not accepted as such by all the Indian universities. The committee would further recommend that in the case of students in the Indian universities, study in chemistry, physics, and biology carried out within the colleges of these universities subsequent to the passing of the matriculation examination, although prior to the completion of the additional examination required by the Council, be recognised as part of the medical curriculum.

The report was adopted.

Report of the Pharmacopœia Committee.

The Pharmacopœia Committee in their report stated that :

> From November [illegible], 1913, to May [illegible], 1914, the number of copies of the British Pharmacopœia [illegible] sold by the publishers was [illegible]. The total number of copies sold in the year beginning May 28th, 1913, was 1052, a larger number than in the year preceding. Up to the present time 46.031 copies of the Pharmacopœia and 4525 copies of the Indian and Colonial Addendum have been sold.
>
> A revised proof of the Text and Appendices of the British Pharmacopœia (1914) has now been prepared, and copies of it will be laid before the Council by the chairman. This proof is submitted subject to the typographical and other editorial corrections which may be necessary, and to the addition of an Index. The Committee will presently meet to consider such corrections, &c., and to pass for publication the final draft of the work.
>
> It is suggested that, as in 1898, the Council should now delegate to the Executive Committee the duty of adopting the completed work as *The British Pharmacopœia, 1914*, of making the statutory arrangements with the Treasury, and of giving the statutory notices of formal publication.

Dr. NORMAN MOORE moved that—

> It be delegated to the Executive Committee to receive from the Pharmacopœia Committee the completed draft of the new Pharmacopœia, to adopt it on behalf of the Council as the British Pharmacopœia (1914), to carry out the statutory procedure as to fixing the price at which copies are to be sold, to give the official notices in the gazettes and to make the necessary arrangements preparatory to the issue and publication of the report.

The PRESIDENT said that he had great pleasure in laying on the table a revised proof from the Pharmacopœia Committee. It represented many years of work, but with the assistance of very able editors the committee had secured what it was hoped was quite worthy to take its place as the official medicine book of the empire.

The motion was agreed to.

Students' Registration Committee.

A report on exceptional cases was received from the Students' Registration Committee.

Dr. SAUNDBY drew attention to two applications for registration without further preliminary examination which the committee recommended should be acceded to. These, he said, came from a commander and a sublieutenant in the Royal Navy. It was stated that these gentlemen had passed examinations in all subjects required by the Council except Latin. Why should they be allowed to enter upon a medical course without having taken an examination in Latin?

Dr. MACKAY defended the recommendation of the committee on the ground that both gentlemen were highly educated men, and as such had attained a standard which made them fully competent to undertake a medical curriculum.

Sir JOHN MOORE thought that if an exemption was to be given for such a subject as Latin it should be done formally. He regarded this as the thin end of the wedge. At present he did not think the Council should exempt anyone from a compulsory subject like Latin, and this ought not to be done so long as all the drugs in the Pharmacopœia had Latin names.

Sir W. WHITLA said that the Council must not forget that one of the first things it had to do was to turn out men able to write a prescription in Latin. He thought that these gentlemen might be allowed to commence their medical studies if they undertook to pass an examination in Latin.

Dr. NORMAN MOORE declared that the committee was not attempting to carry out anything behind the back of the Council. It was its duty to decide exceptional cases and not to undertake an educational crusade. These gentlemen had no doubt passed an examination in Latin which did not come up to the standard required by the Council, but they had passed very severe examinations in mathematics and other subjects, and he thought their applications should be acceded to.

The report, including the recommendations that the applications of these two gentleman should be acceded to, was adopted.

Public Health Committee.

Sir JOHN MOORE presented the report of the Public Health Committee. It dealt in the first place with a revised form of warning notice, but this subject had earlier in the day been considered by the Council *in camerâ*. The committee, the report stated, had had before it a communication from the University of Cambridge asking for guidance as to carrying out Rule I. of the Regulations for the Diploma in Public Health. The committee approved the following answer which was sent to the Registrary of the University on Jan. 8th, 1914 :—

> Rule I., which has no notes or exceptions attached to it, requires that the curriculum must extend over not less than nine months. The other rules specify courses of particular duration, and clearly indicate

that substitutes are possible, but these substitutes are not meant to shorten the curriculum.

The report contained recommendations to the effect—

(1) That the answer sent to the University of Cambridge as to the precise meaning of Rule I. of the Regulations for the Diploma in Public Health be approved, and used as occasion may arise as a reply to any similar inquiry; and (2) that all examinations conducted for the purpose of conferring the several registrable degrees, diplomas, or certificates in sanitary science, public health, or State medicine, specified in Table G at page lxxv. of the Medical Register should be inspected, and it should be remitted to the Executive Committee to report on the necessary arrangements.

Sir JOHN MOORE said in regard to the latter recommendation that 20 years had elapsed since the diplomas in public health were inspected. Since then many institutions had established diplomas which had never been inspected. This fact made inspection essential. The committee suggested that inspection should extend over three years.

Both recommendations were adopted.

Appointment of General Registrar.

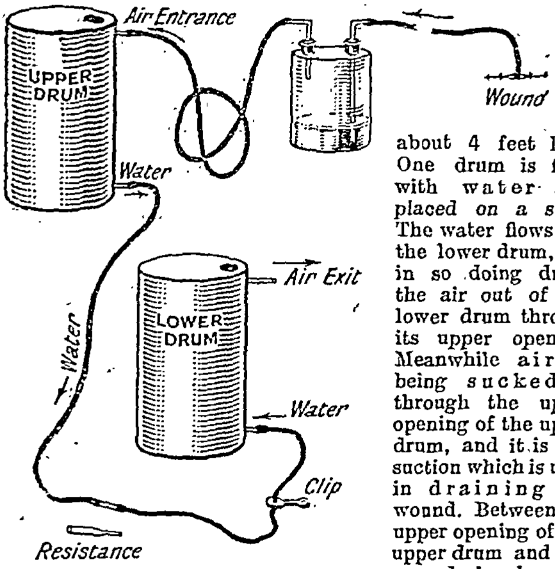
Mr. NORMAN KING was reappointed General Registrar.

A vote of thanks was passed to the President for his services in the chair. The session then concluded, and the Council rose to meet again in November.

New Inventions.

DRAINAGE BY SUCTION.

THE accompanying diagram shows the working of an apparatus which has been found of great value in the treatment of such conditions as suprapubic cystotomy, liver abscess, and empyema thoracis. An absolutely continuous suction can be readily maintained and any cavity which is opened by an operation can be kept empty, while the incision itself remains free from urine, pus, &c. The apparatus itself is easily made and so simple in action that no difficulty is met with. Two drums holding, say, four gallons are taken, and to each are attached two small projecting tubes, one at the top and one at the bottom. Any other openings in the drums are soldered up. The lower projecting tubes of the drums are permanently connected by means of rubber tubing about 4 feet long. One drum is filled with water and placed on a stool. The water flows into the lower drum, and in so doing drives the air out of the lower drum through its upper opening. Meanwhile air is being sucked in through the upper opening of the upper drum, and it is this suction which is used in draining the wound. Between the upper opening of the upper drum and the wound is placed a "bubbler" in which the pus or urine collects. Whenever the water from the upper drum has completely run out, the drums are reversed. At the same time the suction tube is changed over from one drum to the other, so that it is always attached to the upper opening of whichever drum is uppermost. It is important that all joints should be gas-tight, and this is readily secured by means of soft wax. It is convenient to place a clip on the tube which connects the lower drum openings, so that the flow may be stopped when required. It is also desirable in most cases to place a "resistance" in the lower tube to prevent too rapid a flow. A small glass tube drawn out at one end serves well for this purpose (e.g., a fountain pen filler). For drums I usually employ stout petrol drums. Ordinary kerosine oil tins have also been used and can be procured anywhere in India, &c. These, however, have the disadvantage of being noisy and may startle the patient when changed over, as the alternations of pressure from plus to minus and the reverse cause the sides to bulge or be sucked in, and this movement is sudden and disturbing. It is advisable that the tube which is in the wound should be packed tightly at the time of the operation, and there is seldom any difficulty in preventing air from entering. Usually there is no air entry at this point, and the rate of flow of water from one drum to the other corresponds merely to the rate of flow of urine or pus into the "bubbler." At the worst, even if air freely enters at the wound end, the drum need not be changed oftener than every three or four hours. I always anchor the tube in the wound by means of a suture, one loop being passed through the skin and knotted, a secondary loop being passed through the tube. If a small needle is used the punctures made in the tube give no trouble. When the tube in the wound is changed the secondary loop alone is divided, and the new tube is anchored by means of a suture passed under the primary skin-loop. The amount of suction depends of course on the difference in water level in the drums, and is thus under easy control and can be varied at will. It is often advantageous to have two tubes in the wound, one connected with the "bubbler" and the other for use in periodically irrigating the cavity. This latter is closed with a clip when not in use, and if left long the main dressings need not be disturbed while irrigation is being done.



This method of drainage has been found invaluable in the following conditions. 1. Vesical calculus. Suprapubic lithotomy is robbed of all difficulty in after-treatment. If ordinary care be taken it is perfectly easy to ensure that the wound remains free of urine: No sutures are put in the bladder, but a piece of gauze is usually placed behind the symphysis, and removed after 24 hours. As soon as it is found that the tube is gripped in the wound a smaller tube is used, and in from six to eight days all tubes can be dispensed with. The same of course would apply to prostate operations. The ease with which the after-treatment can be carried out renders suprapubic drainage a justifiable procedure in bad cases of stricture, for after draining in this way for a day or two a catheter should usually pass. 2. Liver abscess (amœbic). In neglected cases where there is a large collection of pus free drainage is, in my opinion, the safest procedure. With suction drainage there is never any fouling from the liver pus, and the wound remains perfectly clean. One can guarantee continued asepsis, although this is almost impossible to maintain if the liver pus is allowed to flow from the wound under the dressings in the ordinary way and saturate everything. It is in these large liver abscesses that the double tube is so useful, as the cavity can be repeatedly irrigated, even while the patient is asleep. The suction helps to cause collapse of the cavity walls, and in a few days it may be that all tubes can be removed even when the cavity originally contained 40 or 50 ounces. 3. Empyema thoracis. Here there should be no difficulty in securing a gas-tight wound from the outset, and no pus need get on the dressings. The suction undoubtedly helps lung expansion, and in suitable cases could be increased at will. The method has many other applications—e.g., after gall-bladder operations, &c.—although I have had no occasion to use it on such cases.

HEALTH AND MORALITY.—The Abolitionist Federation announces an International Conference at Portsmouth, June 15th–18th, in which constructive policy will be discussed under two headings, Reduction of Immorality and Reduction of Venereal Disease. Among the medical speakers are Dr. Santotiquido (Rome), Dr. Lornholt (Copenhagen), Dr. Rist (Paris), Sir Victor Horsley, Dr. Douglas White, Dr. Helen Wilson, and Dr. C. W. Saleeby. The non-medical speakers include the Bishop of Winchester, Mr. Bronoon Reynolds (American Federation of Social Hygiene), Councillor W. J. Dawson (Hull), M. Yves Guyot, and other visitors from France, Germany, Switzerland, &c. Programmes and tickets may be obtained from the secretary, Miss McNeill, 19, Tothill-street, London, S.W.

WHAT EVERY DOCTOR REQUIRES

is insurance against all the risks of his Profession. The ideal Policy is one which

1. Is permanent up to age 65.
2. Covers all sickness and accidents.
3. Gives cover immediately on payment of premium.
4. Provides for permanent as well as temporary breakdown.
5. Grants benefits at the lowest rates combined with security.
6. Gives generous bonuses.

The above are given by the MEDICAL, SICKNESS AND ACCIDENT SOCIETY, the Medical Man's Society.

ADVANCE
IN
IODINE THERAPY.

Activity of IODÉOL.

In the comparative study of the properties of *IODÉOL*, one is at once struck by the fact that whereas ordinary isotonic solutions of colloidal metals contain *only 0·20 gm. of metal per litre*, *IODÉOL* contains the same quantity *in each cubic centimetre.* One ccm. of *IODÉOL* is therefore *one thousand times as active* as the same quantity of the ordinary solutions of metallic colloids. The indications for the therapeutic employment of a colloid such as *IODÉOL* are therefore numerous.

IODÉOL is specific for ***Pneumococcal Disease: Simple Pneumonia, Infective Pneumonia, Broncho-Pneumonia, Pulmonary Congestion*** both in man and animals. It acts as a diaphylactic, germicide, and lymphagogue, liquefies the exudations, modifies the character of the expectoration, relieves cough and dyspnœa, and brings about defervescence within 48 to 72 hours. Mortality barely reaches 3%.

Drs. HERY, BLANC, PHILOUZE,
(Therapeutic Society).
Drs. MIETTE, BRUNET, BOURGEOIS,
(Int. Cong. Path., Paris.)

Intra-muscular injections of IODÉOL are painless; they should be administered in the gluteal region at the seat of election, a needle one and fifth inch long and one thirty-sixth of an inch in diameter being employed.

CAPSULES containing doses of 4 grains of electro-chemical colloidal Iodine perfectly tolerated. Ten **times more active** than iodides, yet never producing iodism.

LIQUID FOR EXTERNAL USE containing 50% colloidal Iodine (should never be injected). Used in the same way as tincture of iodine, but ten times more active. Never causes **burns** or **irritation,** does not colour the skin, and is absorbed extremely rapidly.

OVULES. Each containing 22 grains colloidal Iodine. **ANTISEPTIC** without **IRRITATION.**

IODARGOL

The specific of GONORRHŒA, Acute or Chronic. Painless Injections.

LONDON: SATURDAY, JUNE 6, 1914.

Departmental Regulations Under the Mental Deficiency Act.

THE Mental Deficiency Act, which came into force on April 1st, imposes on the Lunacy Commission, enlarged and reconstituted under the title of the Board of Control, the additional duty of organising and superintending an elaborate system for the supervision and treatment of certain categories of mental defectives who have not hitherto been directly amenable to any form of compulsory care. The local authority primarily responsible for the discharge of the new functions created by the Act is in counties the county council and in boroughs the borough council, but new and important duties are also assigned to the local authorities under the Education Acts and the Poor-law, and one of the first tasks confronting the Board of Control has accordingly been to arrange for the harmonious working of its own local machinery at the numerous points where it comes into contact with the machinery of the other administrative departments. The Circular Letters and Provisional Regulations recently issued by the Board of Control, the Board of Education, and the Local Government Board would appear to show that this somewhat difficult and delicate operation has been carried through with a degree of success which is highly creditable to the energy and tact of all the departments concerned, and is in itself a striking evidence of the reasonable and temperate spirit which animates the policy of the Board of Control.

The new powers created by the Act may be considered, from a practical point of view, under two main aspects, according as they affect the feeble-minded while still within the limits of school age, or as they relate to adult defectives who have committed criminal offences or who are likely to suffer through not being under proper care and control. Criminal defectives may be left out of account for the moment—in their case no inter-departmental question arises: they are brought under the operation of the Act either at the time of conviction, when the court may hand them over to the local control authority, or, in lieu of sentence, may make an order for their treatment in some one of the methods laid down in the Act, or subsequent to conviction, when the same course may be taken by the Secretary of State. Of adult defectives other than the class we have just referred to, the majority who may come within the scope of the Mental Deficiency Act are persons chargeable to the Poor-law. The Act definitely lays down that the responsibility of the Poor-law authorities for the relief of mentally defective persons is to remain unimpaired; and it is only when certain special circumstances, defined in the Act, are present that the transfer of such persons to the local control authority can even be proposed. In any such case the method of procedure set out in the Provisional Regulations is that the Poor-law authority may report the case to the Local Government Board who, if concurring in the report, may transmit it to the Board of Control, and the Board of Control, if satisfied that the local control authority are able and willing to take the person under their charge, may issue a certificate sanctioning the transfer. As this process at each of its successive stages is purely permissive, and as the powers of the local authority are further limited by the amount of financial aid obtainable from the Parliamentary grant, it is probable that the number of such transfers will not be very large. It is to be hoped, however, that there will be no hesitation on the part of boards of guardians in having recourse to these special provisions as a means towards the protection and control of weak-minded girls.

Valuable as the Act will doubtless be in removing some of the more urgent difficulties in the management of adult defectives, there can be no question that its more important and more fruitful influence will be exercised through its application to the feeble-minded during the earlier years of life. For this reason particular interest attaches to the Regulations and Model Arrangements which have been framed by the Board of Education in consultation with the Board of Control, and which, read in the light of the circular letter issued by the former department, give a very clear idea of the policy that it is proposed to adopt in working the sections of the new Act having reference to mentally defective children. The scheme outlined in these documents is, of course, to some extent of a provisional and tentative character, but in the main it appears likely to commend itself to the approval of those who have had experience in the practical difficulties of the problem. Section 31 (1) of the Mental Deficiency Act lays upon local education authorities the duty of ascertaining what children within their area are defective within the meaning of the Act, and which of such children are incapable by reason of mental defect of profiting by instruction in special schools: and it further requires them to notify to the local control authority all children who are ascertained to be unfit for such schools, whether through inability to profit by the training or through being a source of detriment to other children, as well as children who on or before attaining the age of 16 are about to be withdrawn or discharged from a special school, and in whose case the education authority considers that it would be to their benefit that they should be brought under the operation of the Act. Notification is to be in accordance with the Regulations made by the Board of Education, which are to have effect as if enacted in the Act. The Regulations, therefore, are binding on all local education authorities. They provide that where it is proposed to notify to the local control authority any child, not being an idiot or an imbecile, as unfit for instruction in a special school, the education authority shall, if required by the Board of Education, refer the case to that department before taking action. It is the view of the Board of Education that, while children rightly classified as idiots or imbeciles are ineducable, children rightly classified as feeble-minded are educable to a greater or less degree, and should in all cases be given an adequate trial under suitable educational conditions in a special school before being pronounced incapable of instruction and being handed over to the control authority. To give effect to this view the Board require that in each case prior to notification a copy of the report of the certifying medical officer shall be submitted to them, so that they may satisfy themselves that there is no *prima facie* reason to suspect that the child is not correctly described as an idiot, an imbecile, or a moral idiot. This attitude of the Board of Education gives very great practical importance to the question of diagnosis, and to secure a high standard of accuracy in this respect the model arrangements suggest as a desirable form of report the very elaborate schedule printed in Appendix E of the annual report for 1911 of the Board's chief medical officer. While this schedule has many admirable features, it may be open to doubt whether a simpler scheme of examination might not yield better results in practice. It appears to be somewhat of a counsel of perfection to require school medical officers to enter into such psychological refinements as are involved in measuring the capacity for the "formation of motor ideas," or in estimating, under "reactions resulting from sensory stimulation," the power of forming concepts of "relationship (similarity, contrast, symbolism)." Subtleties of this sort, many of which imply adherence to psychological theories that are by no means universally accepted, are hardly suited to the purposes of a standardised form for recording clinical observations.

In this connexion we may note as somewhat singular that the memorandum of the Board, while so liberal of psychology in its appendix, does not anywhere define the border-lines between idiocy and imbecility, and between imbecility and feeble-mindedness. The definitions of these degrees of defect are of special importance in view of the marked differences in the treatment which is to be applied to them under the scheme of the Board, and the rough practical tests relied on in the first section of the Mental Deficiency Act will hardly be sufficient for the requirements of exact diagnosis. The subject is, of course, extremely difficult and obscure, and it would be unreasonable to expect satisfactory results from the first efforts to provide official guidance in its complexities. Such efforts, however inadequate, will deserve commendation if they promote, as the schedule of the Board will no doubt promote, careful study and accurate record of the facts.

◆

The Cow as an Agent of Diphtheria Infection.

The Local Government Board has issued an instructive report by Dr. Hugh A. Macewen on an outbreak of diphtheria occurring in the South of London in December last which was attributable to milk infection. The outbreak, which Dr. Macewen investigated in conjunction with Dr. J. Priestley, Dr. Stanley Child, and other medical officers of health concerned, affected 119 cases in 94 houses situated in Croydon, Lambeth, Penge, Camberwell, Lewisham, and Beckenham, all obtaining milk from a dairy situated in Lambeth and doing a large business in the districts named. The cases were distributed widely throughout several different sanitary areas, most of which had large populations and shared in the general prevalence of diphtheria that occurred throughout London in the autumn and winter of 1913. Had it not been for the careful nature of the inquiries made by the various public health officers the common origin of the infection in these different areas might well have been overlooked. Once the matter was gone into, however, there could be no doubt that the incidence of the disease had fallen in quite an exceptional degree upon the customers of the dairy in question, and that the milk sent out from that establishment had been infectious for a period of about three weeks. At one time it appeared possible that the infection might have been conveyed to the milk after it reached Lambeth, as certain of the distributors employed by the dairy were ascertained by Dr. Priestley to be carriers either of the Klebs-Löffler or of a "diphtheroid" bacillus. The possibility of infection occurring in course of the delivery of the milk cannot be lost sight of, and the facts as to the incidence of diphtheria on the different milk rounds of the dairy, which were worked out by Dr. Priestley, suggested that infection by these distributors might have acted as a contributory cause of the outbreak. It was concluded, however, that the bulk of the supply must have been infected before the milk was taken over by the suspected distributors, as a large number of cases occurred on the milk rounds of other distributors who were not diphtheria carriers.

The milk supplied by the dairy was mixed milk obtained from about 17 different farms, and it was presently ascertained that during the particular period in question a portion of the supply which came from one of these farms, situated in Horsham, was in all probability infected. During this period three of the milkers at this Horsham farm had suffered from ulcerated fingers, in one instance so severely that a finger was amputated. Virulent diphtheria bacilli were obtained from the amputated finger of this milker and from a sore on the hand of another milker, the specimens being taken by different observers on separate occasions and being examined in different laboratories. The sores on the hands of the third milker were healed at the time he came under observation. As Dr. MACEWEN observes, it was difficult, if not impossible, to dissociate the cows from the milkers in considering how the milk became infected; the milkers had been free from diphtheria or sore-throat infection at their homes and they could hardly have been infected one after another on the fingers apart from the agency of infection on the cows' teats which they handled. It was found that in five of the cows at the farm irregularly shaped sores had been present on the udder and teats, situated usually on the upper portion of the teats, which resembled the sores on the milkers' hands. No great attention had been paid to these sores, and it could not be ascertained how long they had been present; it appeared tolerably certain that they had been observed before the first milker's finger was affected. At the time the farm was visited the sores were practically healed, and only a dry surface remained from which no swabs could be obtained. Samples of the milk were examined for the presence of diphtheria bacilli with negative result, but as these samples were not taken until Feb. 2nd, when all the external lesions were healed, no inference could safely be drawn as to the bacterial condition of the milk of these cows during the infective period in the previous December.

The unusual features of this outbreak deserve notice, and may usefully be borne in mind in similar cases where milk is suspected, and its prolonged daily infectiousness cannot be explained by a diphtheria case or carrier having access to the milk. The suggestion that cow infection may play a part in milk epidemics of diphtheria is not new, though well authenticated cases are rare. Sir WILLIAM POWER, to whom we owe the demonstration, in 1878, that diphtheria can be spread by milk, himself suggested the possibility of cow infection when reporting in 1886 on the facts of a remarkably severe outbreak of diphtheria in York Town and Camberley. Here, although he succeeded in tracing the infection to the milk of a large dairy, inquiries failed to produce any evidence of diphtheria among the milkers, and it was pointed out that a hypothesis of continued or intermittent infection of the milk as obtained from the cow could not be disregarded. In 1906 Dr. A. ASHBY reported in detail on a condition of the udders and teats of cows, similar to that now described at Horsham, in a dairy herd the milk of which had caused a considerable outbreak of diphtheria at Twyford. In this case the milkers' hands appear to have been unaffected, but diphtheria bacilli were demonstrated in the sores on the teats of the suspected cows. It is to be regretted that in the present instance the circumstances did not suggest or permit earlier examination of the cows at the Horsham farm and so complete on the bacteriological side the interesting chain of evidence which we have summarised. In such cases it is evidently desirable to lose no time in introducing the bacteriologist to the cow.

Annotations.

"Ne quid nimis."

THE BORDERLAND OF NEUROLOGY AND PSYCHIATRY.

AT the recent quarterly meeting of the Medico-Psychological Association of Great Britain and Ireland, which was reported in our last issue, Dr. Helen Boyle, of the Lady Chichester Mental Hospital, read a paper on the question of how to improve treatment in the matter of early nervous and mental cases. The subject is undoubtedly one that is surrounded by both theoretical and practical difficulties, as several of the speakers in the subsequent discussion fully recognised. The general tenor of Dr. Boyle's paper was that neurology and psychiatry were as a rule practised separately, with not infrequently unfortunate consequences to the patient. Cases of mental disease in an early stage were diagnosed as neurasthenia and subjected to rest-cure treatment, which often was not merely useless but positively harmful. It was remarked with truth that the last person to see an early mental case was usually the alienist, who is nevertheless the specialist in that class of disease. There is, of course, no hard-and-fast line to be drawn between nervous and mental diseases. From whichever side they are approached border-line cases are constantly occurring. If the neurologist makes the erroneous diagnosis of neurasthenia in a case of exhaustion psychosis, the alienist may fail to recognise a cerebral tumour running perhaps an atypical course in a case with obvious disorders of conduct. We must admit that, broadly speaking, neurology and psychiatry have each a wide field, and that many cases are easily and readily placed as belonging to one or other category. But no one denies that leakage from one group to the other is a matter of everyday occurrence. To obviate mistakes, and, indeed, to avoid the unsatisfactory transference of cases where no mistake is made, the *neurologist* should be sufficiently familiar with the early forms of insanity, just as no psychiatrist can afford to dispense with a neurological training. No antagonism exists between the two sister sciences, and we believe that the whole tendency of modern developments in the study of disease of the nervous system is to bring them closer together than ever before. This is just as it should be. At the same time it must be said that asylum officers will often be found frankly to admit that they are conscious of having begun at the wrong end, so to speak, and that they feel that a working knowledge of the main facts of neurology should be theirs before ever they start on what is the higher study of the two—the study of the mind diseased. Comparatively few asylum officers have had such a training. In this connexion the newly instituted diplomas in psychological medicine are proving a splendid incentive to the psychiatrist to make himself as strong on the neurological side as he is on his own. Nor should the neurologist feel that because a patient begins to show so-called mental symptoms the case is passing beyond his ken. He, too, should have had at least some asylum training, and he cannot afford to ignore the importance of an adequate acquaintance with the main facts and principles of so-called mental disease. We agree with Dr. Boyle that neurology and psychiatry are parts of the medical curriculum of which as a rule the student is somewhat shy; they are not brought prominently before him, and unless the physician in the hospital wards has himself shown interest in that class of case the student may have seen very little to help him when at length he joins the ranks of the general practitioner. For this reason we welcome the advances that are unquestionably being made. Several of the large general hospitals have neurological departments; most have at least one member on their staff who is alive to the importance of these specialties, and who chooses to teach on such cases in preference to others drawn from the other sections of internal medicine. It is rather on the side of psychiatry, on the whole, that the student is still not so well catered for as he might be, but already more than one general hospital has an out-patient clinique for mental cases, and ere long London will be still better off in this connexion. We see no reason why there should not be both neurological and psychiatrical cliniques at general hospitals, and it is possible that some day the physician at the head of such cliniques will be neither neurologist nor alienist, but a teacher with full experience of both nervous and mental disease. It is our impression that on the continent there is more coöperation in the two branches than in England; at least, more neurologists are members of psychiatrical societies, and *vice versâ*, than at home. In any case, it seems clear that in order to keep abreast of advances in knowledge of the functions of the nervous system both alienist and neurologist must continue to learn each from the other. We know that prejudices die hard, and that the stigma supposed in the mind of a considerable section of the public to be attached to the word asylum is a potent factor in the continuance of the present unsatisfactory situation. But this stigma is gradually disappearing; and were the public to become more familiar, by means of hospital cliniques and otherwise, with the view that mental disease is nervous disease, it would in time vanish altogether. All endeavours to achieve that end are worthy of the strongest support.

ACUTE PANCREATITIS.

PROBABLY one of the latest abdominal lesions to be recognised was acute pancreatitis, and yet it is one of the most important and most serious of the many acute affections involving the abdominal viscera. It is not, however, so important on account of its frequency, for acute pancreatitis is one of the rarer abdominal lesions, as on account of the difficulty in recognising it, at least in most cases. The rarity of the condition renders it unlikely that most surgeons will see many cases of the disease, and, in fact, it falls to the lot of few surgeons to see more than one or two examples. In the present issue of THE LANCET we publish an interesting and important paper by Mr. A. E. Barker, who has collected the notes of six cases which have been under his own care or that of his colleagues at University College Hospital. It is of interest to note the conclusions at which Mr. Barker has arrived. He points out that in several of the cases there had been previous attacks evidently of the same nature. The sudden onset and the severity of the pain were very marked. In no case was any tumour discoverable in the epigastrium without an anæsthetic, and even after the administration of an anæsthetic in only one case could a swelling be felt. With regard to treatment, drainage of the omental sac is not sufficient in most cases, and Mr. Barker insists on the need for retroperitoneal drainage. As to the results, of the five cases in which an operation was performed four recovered. With earlier operations the danger of the condition will probably be greatly diminished.

FERRO-CHROME DANGERS.

IT appears that ferro-chrome is liable, like ferro-silicon, to give off poisonous phosphoretted hydrogen gas, and the attention of the Local Government Board having been drawn to the subject, three officers were appointed to institute an inquiry. The results obtained now appear in a report published last week, signed by Dr. S. Monckton Copeman, F.R.S., medical inspector of the Local Government Board; Mr. Samuel R. Bennett, M.A., one of H.M. inspectors of factories; and Mr. H. Wilson Hake, Ph.D. Chromium as a constituent of steel confers important physical properties, but chiefly it hardens the material and as the proportion of chromium increases the alloy exhibits a high resistance to rupture and a high elastic limit. Chrome steels are mainly used for armour plate, armour-piercing projectiles, some high-speed steels, steels for stamps and crushers, and also for files, tyres, and springs. According to Dr. Monckton's summary of Dr. Hake's investigations there would seem to be no doubt that an excess of aluminium in chrome steel alloys is coincident with a tendency to spontaneous disintegration, accompanied by evolution of phosphoretted hydrogen. It may be remembered that ferro-silicon is prone to disintegration, especially in presence of moisture, poisonous gases being given off in such quantity as to bring about fatal results in human beings subjected to such emanations. Consignments, however, of ferro-chrome had been found to evolve "acetylene smelling gas more strongly than the worst ferro-silicon." Samples were found to fall to powder very readily on exposure to air and moisture, and paper impregnated with silver nitrate assumed an intense black colour almost immediately on exposure to the gases given off from this material, while lead paper was unaffected, thus indicating the evolution of phosphoretted hydrogen in large quantity. The explanation offered was that this must have been due to an abnormally high percentage of silicon, whereas ordinary ferro-chrome is almost as hard as cast iron. It now seems fairly established, according to this report, that the disintegrating quality of ferro-chrome is not due to silicon but to an excess of aluminium present. It certainly appears to be the case with the related material ferro-silicon. A sample of this latter with pure aluminium introduced proved to be specially liable to disintegration, giving off at the same time large quantities of phosphoretted hydrogen, while another sample freed from aluminium did not disintegrate, although otherwise of practically the same composition and exposed to similar conditions in all respects. By previous methods of manufacture apparently aluminium was practically excluded, but by a later method, in which the affinity of aluminium for oxygen was made use of, the resulting alloy contained important quantities of this metal. The method consists in the reduction of chromium oxide to metallic chromium by the combustion of aluminium. The older methods, however, are capable of introducing aluminium, since this occurs in the chromium ore itself, apart from that contained in the coal employed to reduce the ore to the metallic state. The avoidance of any risk to life arising from the disintegration of ferro-chrome, which leads to the evolution of poisonous phosphoretted hydrogen, would thus appear to rest upon the elimination as far as possible of aluminium in the resulting alloy, and Dr. Hake reports that while ferro-chromes are not entirely free from danger, the dangerous samples have, until recently at any rate, been rather the exception than the rule. But in every case the offending ferro-chrome was always one containing a marked amount of aluminium (1 to 7 per cent.), whereas in the innocent specimens quite small quantities were found, a good typical specimen containing only 0·08 per cent.

JAUNDICE IN TUBERCULOSIS.

JAUNDICE is a rare condition in tuberculosis. In the *American Journal of the Medical Sciences* for May Dr. John M. Cruice has published an important paper on this subject from the Henry Phipps Institute, a source from which have emanated many valuable contributions to the literature of tuberculosis. In 570 necropsies at the institute only three cases of jaundice due to tuberculosis of the liver were encountered. There were also four cases of jaundice in which the patients left hospital, and therefore it could not be proved that the jaundice was due to tuberculosis of the liver. These seven cases of jaundice are all that have occurred in 1748 cases of tuberculosis admitted from the opening of the hospital until Feb. 1st, 1912. Like other forms of jaundice, jaundice in tuberculosis may be due to extrahepatic or intrahepatic obstruction. Extrahepatic obstruction is produced by tuberculous glands in the portal fissure pressing on the bile ducts. This is a rare condition, because these glands do not receive lymph from the intestines or peritoneum. When jaundice is of intrahepatic origin there is tuberculosis of the liver. This condition takes three forms—miliary tubercles, solitary tubercles, and tuberculous cirrhosis. Only in the first two forms has jaundice been reported. Miliary tubercles of the liver are of frequent occurrence, but jaundice due to this condition is very rare. Only one case was observed at the institute. A youth, aged 20 years, was admitted with advanced tuberculosis of both lungs. The liver extended two finger-breadths below the costal margin and the spleen was palpable one and a half finger-breadths below the costal margin. The patient became slightly jaundiced and the liver tender. He died seven weeks later. At the necropsy cavities and miliary tubercles were found in the lungs. The liver was enlarged and fatty, and on microscopic examination showed miliary tubercles. Solitary tubercle of the liver is very rare and may take three forms—conglomerate tubercle, tuberculous cavities or bile-duct tuberculosis, and tuberculous abscess. Conglomerate tubercles are comparatively large caseous masses. Dr. Cruice has been unable to find recorded a single case of conglomerate tubercle with jaundice, but two such have occurred at the institute. Of bile-duct tuberculosis Dr. H. D. Rolleston says it is remarkable that jaundice is constantly absent, although some of the ducts are obstructed. Thayer has reported a case of tuberculous cavities of the liver which showed jaundice for a week but cleared up some time before death. Warthin has reported a case of bile-duct tuberculosis with intense jaundice for three months before death. At times solitary tubercles become secondarily infected with pyogenic organisms and form abscesses. Mr. Mayo Robson has reported a case of tuberculous abscess of the liver which was successfully operated on. For three months before the operation there was a slight tendency to jaundice. From such a small number of cases Dr. Cruice does not draw conclusions, but taking them in conjunction with those reported in literature they suggest: (1) that jaundice in the course of chronic tuberculosis is probably due to some form of tuberculosis of the liver, extrahepatic or intrahepatic; (2) that the degree of jaundice is helpful in surmising the pathological condition, intense jaundice being probably due either to pressure of tuberculous glands on ducts or to some form of solitary tubercles of the liver, milder forms to miliary tuberculosis of the liver.

SCLERODERMIA.

IT was Thirial who, in 1845, first described this condition. The hardening of the skin, its loss of elasticity, its frequent distribution over wide symmetrical areas in the skin, and, when it especially involves extremities, the associated cyanosis and asphyxia of the fingers and toes, resembling markedly Raynaud's disease, present a striking clinical picture. Later observations have shown some curious relationships to this condition not previously suspected. It has been shown that sclerodermia is often associated with abnormal states of the thyroid gland; this may be atrophied or, more usually, hyperactive. Sometimes the thyroid condition may precede the sclerodermia; occasionally the reverse occurs. Further, changes in the pituitary gland have been noted; possibly other glands of internal secretion are implicated in some way not known. It is sufficient to note that there is some intimate relationship between the sympathetic nervous system, the glandular structures controlling it, and sclerodermia. Beyond these points, however, which are in the speculative stage so far as pathogeny is concerned, there have been many interesting observations upon the condition itself. An instructive case has been recorded by Bertolotti in the *Nouvelle Iconographie de la Salpêtrière* (1913, vol. iv., p. 291). The patient was a woman aged 36. There was evidence of atrophy of the thyroid gland; there was some pigmentation of the face suggestive of Addison's disease; the wrinkles of the face were exaggerated and immobile. Hardening and thickening of the subcutaneous tissues was present over most of the body, but most marked in the neighbourhood of the extremities. There were asphyxial troubles of the fingers exactly resembling Raynaud's disease. There was in addition localis[illegible] muscular atrophy; the muscles had in some places undergone an induration sclerosis by a process of interstitial myositis. The tendons were retracted, hard, and presented signs of calcification. In other parts the muscular changes were similar to primitive myopathy. In some places there were in the skin small hard nodules filled with a calcareous substance of dark colour. Radiographic examination showed a certain degree of pituitary hyperplasia. There was, finally, a limitation of perspiration to the hands, an unusual condition, the reverse being more often the case. This writer calls attention to the resemblance of this disease when it has reached this stage to the syndrome known as that of Profichet. In this syndrome the prominent feature is the presence of muscular atrophy and hardened areas in the skin, which can go on to the formation of calcareous nodules. At the necropsy of one of these cases there was found myocarditis and atrophic viscera. It is suggested that this syndrome represents but a further stage of sclerodermia, in which condition similarly fibrous cirrhosis of the liver has been found. The diagnosis of sclerodermia may have to be made from Raynaud's disease when the extremities are especially involved, from von Recklinghausen's disease when there are multiple nodules, and also from gout. In the latter condition the nodules are transparent to X rays, whereas the sclerodermic masses are impervious on account of the calcareous deposit. Treatment is often of little avail, although the intimate relation to thyroid disease suggests the giving of thyroid substance, which has in some cases been followed by good results.

INFANTILE MORTALITY IN THE PHILIPPINE ISLANDS.

AN excessive mortality is known to be occurring among infants in the Philippines, and this massacre of the innocents is greater in the capital city of Manila than in the provinces. In recent years energetic efforts have been made by the American medical officers stationed in those islands with a view to reduce this sacrifice of infant life, but for various reasons, among others owing to the invincible apathy of the Filipino people, little progress has been attained, and much therefore still remains to be done. Some interesting and valuable information on the subject is furnished in an article contributed to the current number of the *Philippine Journal of Science*, Section of Tropical Medicine (Vol. VIII., No. 6), by Dr. W. E. Musgrave, of Manila. It appears that the high infantile death-rate is due to a multiplicity of causes, prominent, however, among which is the very important question of food. The adults of the masses of the population have often the appearance of being ill-nourished, and this to a great extent arises from the poorness of the quality of the foodstuffs forming the staple of their dietary. Among these foodstuffs unpolished white rice has bulked largely for some time, and, as might have been anticipated, beri-beri is far from infrequent, attacking even infants at the breast. The evidence of this insufficiency of nourishment is most marked among the nursing mothers, many of whom unsuccessfully attempt in their half-starved condition to provide adequate nourishment from their breasts for their hungry offspring. It is a curious fact and worthy of note, being contrary to all ordinary experience, that in Manila the death-rate is higher among breast-fed babies than amongst those who are artificially fed. No one disputes nowadays the statement that mother's milk is the ideal food for very young children, but it seems to be otherwise in the Philippines, since the mothers, at least among the lower classes, are unable to furnish to their sucklings milk that is of a quality good enough to meet their requirements. Unfortunately, it is not possible to substitute for the mother's milk clean and fresh cow's milk, for this is not obtainable in sufficient amount, and what little is available is too costly to let it come within the reach of the masses who need it. The milk-supply in Manila is to a great extent obtained from caraboas (a kind of Indian buffalo) and goats, but from the sanitary point of view this supply is dangerous owing to the shocking conditions under which much of it is produced for sale. The methods of collecting, transporting, and using this milk are, according to Dr. Musgrave, "unbelievably filthy." As sold in the streets of Manila, it is generally from 26 to 30 hours old; it has already been diluted with tap-water—or worse; it has been collected and transported in dirty vessels, and has been milked by unclean persons from unclean animals. It is condemned by chemical and bacteriological examination, and often contains dangerous bacteria. It seems, therefore, that in existing circumstances, a raw fresh milk being unattainable, it becomes necessary to consider the advisability of sterilising or pasteurising the available supplies. Dr. Musgrave very properly points out that in the climate even sterilised milk rapidly deteriorates unless kept in ice, a course impossible for the great majority of the Filipino population. The conditions for the growth of micro-organisms are ideal in the Philippines, so that when preserved and condensed milk is used it must be consumed as quickly as possible after the tin is opened, otherwise it is apt to become dangerous from the rapid growth of bacteria. Another source of peril to the child is the dilution of condensed milk, after the tin is opened, with unboiled water derived from a contaminated source. The best brands of condensed milk are available in the Philippines, but the poorer classes insist on buying the cheapest kinds, the worst from the nutritional point of view, lacking largely a sufficiency of the substances which the child needs for its growth. Before any great improvement can take place it is obvious that education of the common people, especially of young women and girls, is necessary with regard to the best and most nutritious articles of diet, and as to the care and management of infants, along with the establishment of public nurseries where practical instruction can be given. It is, however, essential in the Philippines, if this wastage of child life is to be checked, that public opinion on the subject be thoroughly awakened. We are glad to learn that the whole matter is now under the consideration of the Philippine legislature.

PARALYSIS AGITANS TREATED BY NUCLEINATE OF SODA.

ON the hypothesis that Parkinson's disease may be due to defective quantities of metabolised nuclear material, especially in the nervous elements of the body, it has been suggested that nuclein may perhaps improve metabolism and consequently relieve the symptoms of the disease. Dr. N. Büia reports the results which he has gained in a series of cases of paralysis agitans treated by nucleinate of soda in the *Comptes Rendus de la Société de Biologie* (1914, vol. lxxvi., p. 507). The period over which the observations were made was five months—a sufficiently long time, he claims, for the effects, certainly beneficial, of this treatment to be judged. The preparation used was nucleinate of soda, 10 per cent. strength in physiological serum. It was tried by mouth, hypodermically, and intravenously. By mouth no effects were observed. Hypodermically 40 centigrammes were given, starting, however, at a lower figure and increasing the amount by 5 centigrammes every two days. 40 centigrammes were not exceeded and the treatment lasted for a month. Improvement in the mental capacity was observed and the patients (five in number) were stated to be generally benefited. Much better results, however, followed the intravenous method. The same solution was used. Effects were noted 15 minutes afterwards. Three types of response were observed. In a few the response was insignificant; in others there was a well-marked thermal rise, sometimes to 39·8° C. occurring within half an hour. There was a sensation of cold and shivering. These immediate effects were followed by later general improvement. In a third class of case there occurred sudden loss of tremor, there was lessening of muscular rigidity, a rise of temperature which subsided to normal in about four hours, and some rise of blood-pressure. Continuance of treatment in such cases showed definite psychic improvement; there was a lessening of the tremor, and a definite increase in muscular force was gained. These effects presented some degree of permanency. In the treatment no untoward symptoms occurred, though in some cases larger doses of nucleinate of soda than 35 to 40 centigrammes caused nausea, vomiting, and vertigo. There were also, occasionally, tachycardia, dyspnœa, and headache. These effects, however, need not be anticipated in moderate doses of the drug. The results appear sufficiently encouraging to warrant further observations upon similar lines.

VOLVULUS AS A SEQUEL TO A BOXING COMPETITION.

A VIOLENT effort may be the exciting cause of volvulus. In the *Australasia Medical Gazette* of April 4th Mr. E. Buckley has reported a case following a boxing competition. A youth, aged 18 years, took part in an amateur boxing competition after a medical examination in which he was found quite sound. He fought six rounds of two minutes each, the whole being considered a strenuous battle, and won. No ill effects were noticed. About midnight he arrived home and his bowels acted half an hour later. Soon after he complained of severe abdominal pain not limited to any particular area. At 6 A.M. he vomited. At 8.30, when Mr. Buckley saw him, he was in great pain and the abdomen was tender all over, particularly in the lower part, but it moved freely on deep respiration. Enemata were given without result. At 11 the abdomen still moved on respiration, but the muscles were slightly "on guard." He was not complaining of pain, but this may have been due to the administration of a quarter of a grain of morphine. At 5 P.M. his appearance had greatly changed. He looked anxious, the pulse was 66 and the temperature 98·6° F. The lower segment of the abdomen was slightly distended and the abdominal muscles were decidedly on guard. At McBurney's point tenderness was acute. He was removed to hospital with a view to operation. The pulse rose to 100, and he vomited bile-stained material for the third time. The abdomen was opened in the appendix region. On incising the peritoneum bright red blood rushed out. A black shining coil of small intestine presented. Other coils were distended and showed numerous hæmorrhagic patches. The junction of the cæcum and the ileum formed a volvulus. The proximal end of the vermiform appendix was included in the constriction, and the distal part was greatly swollen. The twist was relieved without difficulty. The brevity of the illness suggested that the circulation in the intestine would be re-established, and the abdomen was closed. During the night two motions, consisting of dark blood, with much flatus, were passed. At 11 A.M. next day the patient became collapsed, and at 2 P.M. he died, 36 hours after the onset of the illness. It was not possible during the operation to discover accurately the anatomy of the region involved. Unfortunately a necropsy could not be obtained. During the boxing no blow was received on the abdomen. Mr. Buckley suggests that some anatomical condition may have predisposed to the volvulus which was brought about by the exertion of the boxing match.

THE OPERATIVE TREATMENT OF PULMONARY TUBERCULOSIS.

Mr. H. Morriston Davies has recently contributed to our columns an article on the great advances made in the last past decade in the surgical treatment of pulmonary tuberculosis.[1] Of the various methods the induction of pneumothorax by injection of nitrogen into the pleural cavity is the simplest, and should be adopted when temporary collapse of one lung is indicated. But in many cases this operation is impossible owing to pleural adhesions. In such the more severe operation of rib resection has been adopted. A less drastic method, termed "pneumolysis," has been devised by M. Tuffier and recently practised. In conjunction with M. G. Loewy he has described it, and given its results in the special tuberculosis number of the *Interstate Medical Journal*. His method differs from artificial pneumothorax in that only the diseased pulmonary region is immobilised, while in the latter the whole lung is, which M. Tuffier regards as a mistake. He has recently modified and perfected the technique, which is as follows. To produce detachment of the apex an incision 6 centimetres long is made in the second intercostal space, commencing a finger-breadth from the sternum. The intercostal muscles are exposed and divided after inserting a director as deep as the posterior surface of the space. The pleura is reached and carefully detached. A strong toothed-rack retractor is then introduced. At the bottom of the space made by forced retraction between the second and third ribs is exposed the pleura, which is often adherent. With the index finger the parietal pleura is detached, the finger resting against the bone and not against the pleura, and by degrees working its way towards the apex of the lung. The detachment is continued in an upward direction anteriorly until the apex is entirely freed, then posteriorly, where detachment is decidedly difficult. During the operation the lung is seen to collapse on each inspiration. The inspiration and expiration of air in the cavity will soon cause an extrapleural pneumothorax, which may lead to infection. M. Tuffier therefore during detachment has the whole denuded surface covered with a piece of thin silk, which he sometimes coats with a thin layer of vaseline, so that the air does not come in contact with the wound. The lung having been separated, there remains a large extrapleural cavity which must be filled. This he does with adipose tissue, fresh or preserved, Beck's bismuth paste, or bismuth paraffin. The foreign substance must be maintained in place, which is a difficulty. Complete suturing of either the fibrous or muscular tissue, or between the intercostal muscles and periosteum, or autoplasty is performed. The detachment of the lung from the ribs permits of obliteration of a septic pulmonary cavity by facilitating retraction of the lung towards the hilus, and the retraction is rendered permanent by the filling. In a case seen four months after operation the fat used was found to have retained its vitality. The operation was first performed in March, 1912, and subsequently 15 times. In one case it was bilateral for disease progressing on both sides. On the right 450 c.c. of adipose tissue, which had been kept five days on ice, was grafted into the pleuro-parietal space; on the left bismuth paraffin in about the same quantity was introduced. The symptoms were ameliorated and the cough disappeared. Of the other 14 patients, secondary suppuration occurred in four and the graft was eliminated in the abscess. In the remaining ten decided benefit was shown by lowered temperature and diminished expectoration (in one case complete suppression). But as all the cases date from only a few months the value of the method still remains to be decided. Recently Jessen has reported six cases of pneumolysis with results generally satisfactory.[2] M. Tuffier thinks that this method should be adopted early in the disease, just as in a tuberculous joint the surgeon does not wait until suppuration occurs and sinuses form.

---

[1] THE LANCET, April 4th, 1914, p. 950.

MYASTHENIA GRAVIS WITH PSYCHIC SYMPTOMS.

THE pathogeny of this strange, but by no means very rare, disease is still rather obscure. There is, however, little doubt that the glands of internal secretion cannot escape some responsibility. The weakness of the muscles is not dependent solely upon the pathological "lymphorrhages," small collections of small lymphocytes which are distributed in an irregular manner amongst the muscular fibres; the condition is not altogether on a par with the muscular dystrophies. The evidence that the secretory glands are concerned is suggested by several facts. In a very considerable number of myasthenia cases there is enlargement of the thyroid gland; the thymus is often larger than normal; in some cases of Basedow's disease the myasthenic muscle reaction is obtained. There is in both myasthenia gravis and Basedow's disease an increase of oxygen metabolism and nitrogen output. Finally, the extraordinary exacerbations in myasthenia, shown by the way in which these patients may on occasion completely recover, may fluctuate in the intensity of their symptoms, and may be subject to both a chronic and, in some instances, very acute onset of the condition, suggest a close clinical analogy with the similar vagaries seen in Graves's disease. Simple muscular change cannot explain all these variations, for the dystrophies are characterised by their peculiarly insidious onset and their progressive and chronic clinical course. They are associated, too, with no mental disturbance. There has lately been described a case of myasthenia gravis in which the patient had occasional lapses of consciousness, and in the proceedings of the Société de Neurologie de Paris (Dec. 4th, 1913) MM. Souques and Mignot record a case of somewhat similar character. The patient was a man aged 35. He was well in every way till four years ago. Then he noted feebleness of the legs, and later this weakness extended to the arms, trunk, and neck. Such an onset is not unusual. There occurred, however, when in this state a violent paralytic crisis. It involved, not only the above muscle groups, but also the face and the eyes, which showed ptosis and diplopia. Mastication and swallowing became almost impossible. Speech became difficult. In this paralytic state the patient remained for three and half months; then slow recovery ensued, and a year later he was able to leave the hospital. He then had no signs of paralysis. For three months he remained well, and even did some work. But again many signs of weakness gradually returned. Since then for the last year he has remained in an enfeebled state, showing varying degrees of improvement and retrogression. During this time he had two crises. It was in these that he showed mental symptoms. There was marked diminution of the power of memory; his intellect was dimmed; volition impaired. There was also impairment of the senses of taste and smell. The case is instructive in showing the range of variation in intensity of the disease; it shows also that the central nervous system may participate in the response to whatever is the responsible cause of the condition. Adrenal gland was given in this case, but without noticeable benefit.

ATROPHY OF THE MUSCLES OF THE HAND FROM COMPRESSION NEURITIS.

IN the *Review of Neurology and Psychiatry* for April Dr. J. Ramsay Hunt, of Columbia University, New York, contributes another paper on an interesting subject to which he had previously directed attention. Atrophic paralysis of the small muscles of the hand is a very common neurological symptom. It may occur in spinal cord diseases, such as progressive muscular atrophy, syringomyelia, and local lesions in the lower cervical and upper dorsal regions. It may follow involvement of the anterior spinal roots, as in hypertrophic cervical pachymeningitis, and it is often seen in lesions of or after injuries to the brachial plexus or to the ulnar and median nerves. The association of the muscular atrophy with sensory changes, when the latter occur, usually aids in the determination of the topographical localisation of the lesion. Dr. Ramsay Hunt draws particular attention, however, to a type of wasting of the small muscles of the hand in which sensory changes are not found, so that it presents a certain resemblance to an early myopathy or myelopathy. It is due, nevertheless, essentially to a peripheral lesion of purely motor branches of the median and ulnar nerves, and may be divided into a thenar and a hypothenar variety. In the first of these, compression of the thenar branch of the median as it passes behind the anterior annular ligament of the wrist results in a secondary atrophy of the abductor pollicis, opponens pollicis, and outer head of the flexor brevis pollicis. Sensibility in the distribution of the median nerve is normal, while fibrillation is absent. A reaction of degeneration in the affected muscles is obtained. It is this strict limitation of the atrophy which suggests a local lesion, and it is not likely to be confused with any other condition, except the atrophy sometimes seen in cases of cervical rib. In the latter case, however, subjective or objective sensory changes occur, while an X ray photograph will prove of diagnostic value. The hypothenar variety is characterised by paralysis with atrophy of all the small muscles of the hand supplied by the ulnar nerve, and according to Dr. Ramsay Hunt results from compression of the deep volar branch as it passes between the tendons of origin of the short abductor and the short flexor of the little finger. In this case also sensory changes are absent as the nerve involved is purely motor. An interesting minor point in connexion with this variety is the question of preservation of function of the palmaris brevis; that small subcutaneous muscular fasciculus is supplied from the superficial palmar branch of the ulnar nerve, and therefore escapes injury in compression of the deep palmar branch. The exact localisation of the site of compression can be definitely made. As all the muscles supplied are paralysed the injury must take place at a spot central to where the nerve breaks up into its muscular twigs; this is placed between the tendons of origin of the little finger muscles above mentioned, where the nerve comes into close relationship with the hook-like process of the unciform bone. Dr. Ramsay Hunt gives several illustrative instances of these varieties, the recognition of which is of much practical importance.

---

[2] Münchener Medizinische Wochenschrift, July 22nd, 1913, p. 1591.

THE Croonian lecture before the Royal Society will be delivered by Professor E. B. Wilson, Columbia University, on the Bearing of Cytological Research on Heredity, on Thursday, June 11th, at 4.30 o'clock.

THE vacancies in the medical appointments to the King caused by the death of Sir Francis Laking have been filled as follows: Sir Bertrand Dawson, K.C.V.O., physician extraordinary to his Majesty, is appointed physician in ordinary to the King; and Dr. Frederick Stanley Hewett is appointed surgeon-apothecary to the King and apothecary to his Majesty's household. Queen Alexandra also has appointed Dr. Hewett Surgeon Apothecary to Her Majesty and to Her Majesty's Household, in the room of Sir Francis Laking.

THE French Academy of Medicine has elected Sir William Osler as a Foreign Associate of the Academy.

MEDICINE AND THE LAW.

Lord Gorell's Matrimonial Causes Bill.

THE Bill introduced in the House of Lords by the chairman of the recent Royal Commission on Divorce seeks to embody the principal recommendations to be found in both the Majority and Minority Reports. It is not for that reason entirely free from proposals likely to afford food for controversy, but these need not be discussed here. The provisions of the Bill which are briefly indicated below are those which suggest the extent to which the medical profession may have to furnish evidence in matrimonial causes if the measure should become law. It enables husband and wife equally to obtain divorce on the ground of adultery (including any unnatural offence), specifying circumstances which shall afford either absolutely or in the discretion of the court a defence to proceedings in which either divorce or judicial separation is claimed. It enables a decree of judicial separation to be obtained for habitual drunkenness. The words "habitual drunkard" (of either sex) are defined to mean a person who habitually takes or uses any intoxicants, and while under the influence of such intoxicants or in consequence of the effects thereof is at times dangerous to himself or dangerous or a cause of terror to others, or the cause of serious harm or suffering to members of his family or others, or incapable of managing himself or his affairs. The expression intoxicant is to include "any intoxicant, liquor, or sedative, narcotic, or stimulating drug or preparation." It will be observed that the wife or husband of what may be called a "harmless" drunkard will not be able to obtain a separation from him or her unless an incapacity to "manage" be established which may not be easy to prove. The proposed grounds for obtaining a decree of nullity of marriage are: (*a*) incapacity of either party to consummate, or failure to do so owing to the unreasonable refusal of the defendant; (*b*) "that the defendant was at the time of the marriage of unsound mind or in a state of incipient mental unsoundness which has become definite within six months of the marriage, or was at the time of the marriage subject to epilepsy or to recurrent fits of insanity"; (*c*) "that the defendant was at the time of the marriage suffering from venereal disease in a communicable form" or "pregnant by some person other than the applicant." Part II. of the Bill is devoted to the regulation of separation and maintenance orders obtainable on the ground of cruelty or habitual drunkenness. The power to make separation and maintenance orders is accompanied by power to make other orders providing for the care of children and for matters rendered necessary by the making of a separation order. Where a court makes a separation order on the ground of habitual drunkenness it is enabled in addition to order that the defendant shall submit to treatment which it may specify, or be detained in a licensed retreat. The following definition of cruelty is to be noted:—

> The expression "cruelty" means such conduct by one married person to the other party to the marriage as makes it unsafe having regard to the risk of life, limb, or health, bodily or mental, for the latter to continue to live with the former; and proof of the following facts: (*a*) that one party to the marriage has knowingly or negligently infected the other with venereal disease, or (*b*) that a husband has compelled his wife to submit herself to prostitution, shall without prejudice to the generality of the foregoing definition be sufficient proof of "cruelty" as defined.

Specific provision is made in the Bill for the hearing *in camera* of proceedings, if the Court of Appeal or a judge of the High Court so orders in the interests of "decency, humanity, morality, or justice." For similar reasons a court of summary jurisdiction may order the same procedure. This appears to be the second time only that hearing *in camera* has been authorised by statute, the other Act referred to being the recent penal statute dealing with incest, no definition of what is to constitute hearing *in camera* being given. The Bill under discussion also proposes that it shall be unlawful

> To publish any report of any proceedings under this Act until the conclusion of the proceedings, or to publish any pictorial representation of or in connexion with any such proceedings, or to publish any report of any proceedings or such part thereof heard *in camera* as aforesaid.

This last is an interesting and important provision which will generally be welcomed by parties and witnesses alike. The only argument against the forbidding of the publication of reports of proceedings during their progress and of pictorial representations is to be found in the possibility that such publication may lead to important witnesses coming forward who otherwise might not be discoverable, and might not know that their evidence was needed in the interests of justice. The repeals proposed by the Bill are those rendered necessary by the innovations which it introduces.

Bland v. Yates: House Flies as a Nuisance.

An action was recently brought in the Chancery Division by Mr. and Mrs. J. O. P. Bland, the latter being the owner of a house and grounds at Shepperton-on-Thames, against Mr. H. S. Yates, a market gardener owning land adjoining the plaintiffs' garden. The plaintiffs asked for damages and for an injunction to restrain the defendant from depositing manure on his land so as to interfere, by reason of the offensive smell or the breeding and collection of flies, with the reasonable and ordinary comfort of existence of the plaintiffs as occupiers of the premises, or to cause injury to the plaintiffs' health. The plaintiffs claimed sums of money spent by them in trying to exclude flies and unpleasant sights and smell from their house and grounds. The defendant had purchased his land in 1910, the year in which Mrs. Bland bought her house, and had converted meadow land into a market garden, using a system known as intensive French cultivation, necessitating the application of a large quantity of manure which was accumulated and matured at a point close to the plaintiffs' wall until the proper season for putting it on the land. Evidence in support of the plaintiffs' contention that the flies and the smell of manure constituted a nuisance was given by, among others, Mr. E. H. Ross and Sir Ronald Ross, and on the behalf of the defendant denying the alleged nuisance by Professor Kenwood, Dr. J. C. Thresh, and Mr. E. E. Austen of the Department of Entomology, British Museum. Mr. Justice Warrington, who delivered judgment without calling upon counsel for the plaintiffs to reply, said that the question he had to determine was whether the defendant by his operations interfered with the physical comfort of the plaintiffs and their family in the occupation of their house according to the ordinary notions prevalent among reasonable English men and women. He had to take the matter into consideration in connexion with all the circumstances of the locality. He found that during the warm months the plaintiffs did suffer interference with their comfort as occupiers of their house and garden according to ordinary notions. As to whether this amounted to a nuisance at law due to the defendant's gardening operations, if a manure heap and the handling of manure were found it did not need much to convince anyone who had had experience of bad smells that these were due to the manure. With regard to flies, the evidence was that the house fly and lesser house fly bred by choice in horse manure, and he could but come to the conclusion that the provision of the flies' breeding-place had had its natural result and that the flies complained of came from the defendant's manure heap. He was reluctant to interfere with a profitable and good industry, but he must grant an injunction restraining the defendant from depositing or stacking manure on his land so as, by reason of offensive smell or the breeding and collection of flies, to occasion a nuisance to the plaintiffs. He did not intend to stop the defendant's garden, but only to prevent him from carrying it on so as to occasion a nuisance to the plaintiffs. He ordered the defendant to pay the costs of the action. The above summary of Mr. Justice Warrington's observations indicates the points to be established and to which evidence must consequently be directed in an action of this kind. The evidence had shown that the manure heap was a large one, and that the spot selected for it had been chosen because the soil where it was deposited was less suited for cultivation than that at a more distant part of the defendant's land.

Workmen's Compensation and the Cause of Death.

Conflicting medical evidence was heard in a case under the Workmen's Compensation Act at the Liverpool county court recently, the claimant being the widow of a joiner named Little, and the respondents a firm of builders. The chief question at issue was whether an accident which had taken place had been the cause of the man's death or had had nothing to do with it. When Little was hanging a door it struck the ceiling, and limewash thus dislodged fell into his left eye, causing injury which eventually necessitated its removal. After this had been done he returned to work, but his health broke down and he contracted bronchitis and died. Dr. Nathan Raw, called as a witness, was of opinion that the mental and physical distress caused by the accident and by its results might have predisposed the deceased to be affected by the illness which caused his death, and that his power of resistance had been diminished. Evidence was given by Dr. J. Drummond as to the deceased's robust condition of health at the time of the accident, and Dr. John Owen had come to the conclusion from reports of the case that the injury could not have been without effect in bringing about the fatal termination of the bronchitis. For the employers, Mr. C. A. A. Dighton, who had removed the eye, refused to trace any connexion between the loss of it and the bronchitis, and Mr. J. F Roberts, who had attended the deceased at the time of his death in the Mill-road Infirmary stated that he died from acute capillary bronchiti due to the extraordinarily foul condition of hi teeth, which he attributed to the excessive chewin of tobacco. Other evidence was given by workmen to the effect that the deceased had worked wel after the accident. The arbitrator was not calle upon to decide the case, which eventually wa settled by mutual consent, the employers agreein to pay a sum of £82 to the widow. His honou Judge Thomas expressed his approval of th arrangement.

ROYAL COMMISSION ON VENEREAL DISEASES.

AT the thirty-eighth meeting of the Royal Commissio on Venereal Diseases evidence was given by Sir Willia Osler, Bart., Regius Professor of Medicine in the Universit of Oxford.

Sir William Osler stated that the official statistics deaths published by the Registrar-General were totall inadequate to represent the actual incidence of venere diseases; for instance, in 1910 the deaths from syphilis i England and Wales were given as 1649, but this was a ver unsatisfactory and incomplete estimate. It was necessary take into consideration and add a very large number of death appearing under other descriptions. If regard were had these, he thought that it would be safe to say that of th killing diseases syphilis came third or fourth. Gonorrh he regarded as one of the great disabling diseases, causin an enormous amount of ill health and playing a very large part in the production of blindness. Sir William Osler laid stress on the importance of early treatment of these diseases, and was of opinion that every general hospital should provide in respect of them out-patient accommodation and proper accommodation in the wards. It was part of the work of the governors of hospitals to provide for these diseases, and they ought not to be left out; in the past they had been too much neglected by the charitable public.

Sir William Osler was in favour of compulsory notification of venereal diseases, and considered there was a possibility that this would result in some concealment, but he thought that this was a risk that might now be taken. On the question of the education of medical students he was strongly opposed to their being dealt with as a special subject added to the curriculum, with special lectures and an additional set of separate examination questions. He considered that if this education could be given in out-patients' clinics and in the wards and by general teachers it was as much as could be expected of the student, looking at the short space of time at his disposal and the great congestion of the curriculum. Sir William Osler thought that it would have an immense effect if the public were instructed by means of lectures regarding venereal diseases. Lectures of this kind, he thought, should not be given by a layman, but by a well-trained medical man who should be provided with proper diagrams and slides. It would be a very useful thing if the lecture could be widely given to the senior forms of the big public schools, in the universities, and at large institutions employing many persons. He was not in favour of teaching sex physiology or hygiene to young children.

At the thirty-ninth meeting Dr. J. H. Sequeira, physician to the Skin Department of the London Hospital, gave evidence. He stated that the statistics of adult cases treated in the London Hospital Skin Clinic during 1913 showed that 13 per cent. both in the case of men and women were suffering from obvious syphilis of the skin and mucous membranes. In the case of the women the proportion in the primary and secondary stages was smaller than in the case of the men, and this he attributed to the fact that a larger number of women were unaware that they were affected with the disease. He gave a number of instances of innocent syphilis, and said that in his hospital experience he found that a larger number of women were infected during their married life. With regard to the use of salvarsan and neosalvarsan, he was confident as a result of his experience of a large number of cases that these remedies provided a most powerful means of influencing the disease. He was, however, of the opinion that it was necessary to combine salvarsan and neosalvarsan treatment with the use of mercury. By prompt treatment the risk of the spread of infection could be enormously diminished.

Dr. Sequeira was not in favour of compulsory notification of syphilis, as he thought it would result in many people seeking advice from quacks. On the other hand, he thought there were conditions in which a medical man should be armed with some power to prevent the spread of infection. It should be held to be the duty of a medical man to do all in his power to prevent the spread of infection, and he should be held to be immune from any penalties in the exercise of his duty. Dr. Sequeira insisted strongly on the need for increasing the accommodation available in general hospitals. There should, he said, be no hindrance whatever to any patient receiving treatment, and the fact of his or her suffering from the disease should be the sole indication for admission.

PRESENTATION TO A MEDICAL MAN.—The townspeople of Horsham, Sussex, on May 26th presented Mr. E. I. Bostock, M.R.C.S. Eng., with a testimonial to mark the close of nearly 40 years' connexion with the local governing body of which he was the head for 30 years. Mr. Bostock was presented with an illuminated album containing an address and the names of the subscribers, and a silver tray, framed portraits, and a cheque for £315 in recognition of the long and valuable services rendered by him to Horsham.

THE LONDON COUNTY COUNCIL AND THE MENTAL DEFICIENCY ACT.

A MEMORANDUM has just been issued by the London County Council to various societies, public bodies, and institutions in the County of London in connexion with the Council's duty of ascertainment of mentally defective persons under this Act. We are asked to give publicity in our columns to the terms of this notice in order that it may be brought to the knowledge of members of the medical profession in London to whom it may be useful to know what is the procedure for the notification of such cases of mental defect as require to be dealt with.

Mental Deficiency Act, 1913.

Under the provisions of this Act, which came into force on April 1st, 1914, the following classes of persons who are mentally defective are deemed to be defectives within the meaning of the Act:—

(*a*) Idiots; that is to say, persons so deeply defective in mind from birth or from an early age as to be unable to guard themselves against common physical dangers.

(*b*) Imbeciles; that is to say, persons in whose case there exists from birth or from an early age mental defectiveness not amounting to idiocy, yet so pronounced that they are incapable of managing themselves or their affairs, or, in the case of children, of being taught to do so.

(*c*) Feeble-minded persons; that is to say, persons in whose case there exists from birth or from an early age mental defectiveness not amounting to imbecility, yet so pronounced that they require care, supervision, and control for their own protection or for the protection of others, or, in the case of children, that they by reason of such defectiveness appear to be permanently incapable of receiving proper benefit from the instruction in ordinary schools.

(*d*) Moral imbeciles; that is to say, persons who from an early age display some permanent mental defect coupled with strong vicious or criminal propensities on which punishment has had little or no deterrent effect.

If, in addition to being a defective as above defined, any person comes within one of the following categories, i.e., if he (or she) is a person—

(i.) Who is found neglected, abandoned, or without visible means of support, or cruelly treated; or

(ii.) who is found guilty of any criminal offence, or who is ordered or found liable to be ordered to be sent to a certified industrial school; or

(iii.) who is undergoing imprisonment (except imprisonment under civil process), or penal servitude, or is undergoing detention in a place of detention by order of a court, or in a reformatory or industrial school, or in an inebriate reformatory, or who is detained in an institution for lunatics or a criminal lunatic asylum; or

(iv.) who is an habitual drunkard within the meaning of the Inebriates Acts, 1879 to 1900; or

(v.) who is a person in whose case such notice has been given by the local education authority as is hereinafter in this section mentioned; or

(vi.) who is in receipt of poor relief at the time of giving birth to an illegitimate child or when pregnant of such child,

such person may be dealt with under the Act.

It is the duty of the London County Council as the local authority under the Act to ascertain what persons within their area are defectives subject to be dealt with under the Act as set forth above, and thereafter to provide suitable supervision for such persons, or, if such supervision affords insufficient protection, to take steps for securing that they shall be dealt with by being sent to institutions or placed under guardianship in accordance with the Act.

The Council is prepared to receive information as to defectives within the County of London who are subject to be dealt with by the Council under the Act as set forth above. Such information should be given on forms which can be obtained on application to the Clerk of the Asylums and Mental Deficiency Committee, 6, Waterloo-place, S.W.

The Council may if it thinks fit:

(*a*) Maintain in a suitable institution, or

(*b*) contribute towards the expenses of maintenance in such an institution, or the expenses of guardianship of persons who are defective within the meaning of the Act but who do not come within one of the categories of defectives referred to (i., ii., iii., iv., v., or vi.).

Applications for action to be taken by the Council under this provision also should be addressed to the Clerk of the Asylums and Mental Deficiency Committee. Every such application will be considered and dealt with on its individual merits.

The London County Council, it should be noted, has no duties with regard to defectives who for the time being are provided for by boards of guardians or by the Metropolitan Asylums Board (except to the extent prescribed by certain provisional regulations under the Act); or to defective children between the ages of 7 and 16 who are being dealt with by the local education authority.

THE SERVICES.

ROYAL NAVY MEDICAL SERVICE.

THE following appointments have been notified:—Fleet-Surgeons: J. Shand to the *Victory*, additional, for Portland Hospital; H. W. Finlayson to the *Marlborough*, and P. E. Maitland to the *King Edward VII.*, both for the general staff duties; W. J. Bearblock to Portsmouth Dockyard; W. B. MacLeod to the *Bellerophon*; P. H. Boyden to the *Collingwood*; and E. C. Ward to the *Cornwallis*, on becoming parent ship. Staff-Surgeon: E. S. Wilkinson to the *Marlborough*. Surgeons: J. S. Elliott to the *King Edward VII.*; W. Miller to the *Victory*, additional, for disposal; A. Simpson to the *Victory*, additional, for disposal; A. C. Paterson to the *Fisgard*; D. H. C. Given to the *Vivid*, additional, to be lent to Plymouth Hospital; F. W. Quirk to the *Vivid*, additional, for disposal; H. M. Langdale to the *President*, additional, and for Haslar Hospital, as Anæsthetist and Radiographer; W. Bradbury to the *Pembroke*, additional, for disposal; G. M. Levick, A. T. Rivers, and H. F. Briggs to the *Victory*; and M. P. Fitzgerald to the *Vivid*; A. E. P. Cheesman to the Royal Marine Division, Chatham; F. L. Smith to Pembroke Dockyard; M. F. Caldwell to the *Indus*; E. C. Holtom to the *Excellent*; A. J. Tonkinson to the *Vivid*, additional, for disposal; and J. S. Orwin to the *Vivid*, additional, for disposal.

Fleet-Surgeon George Robert MacMahon has been placed on the Retired List at his own request (dated May 24th, 1914). Fleet-Surgeon Henry Frederick Iliewicz has been placed on the Retired List at his own request (dated June 1st, 1914).

ROYAL ARMY MEDICAL CORPS.

The undermentioned Captains to be Majors (dated June 1st, 1914): Percival Davidson, D.S.O., John Mackenzie, Norman D. Walker, Arthur H. Hayes, Henry J. Crossley, Reginald Storrs, Raymond L. V. Foster, Frederick A. H. Clarke, George A. K. H. Reed, John M. H. Conway, Sydney M. W. Meadows, William W. Browne, William D. C. Kelly, and Norman E. J. Harding.

Colonel C. Cooper Reilly has been selected for appointment as Assistant Director of Medical Services to the Chatham District. Colonel R. H. Firth has taken up duty at Cherat Cantonment as Assistant Director of Medical Services. Brevet-Colonel F. Smith, D.S.O., has joined Army Headquarters at Dublin.

Lieutenant-Colonel R. Holyoake has been selected for appointment as Senior Medical Officer in charge of the Military Hospital at Kamptee Cantonment. Lieutenant-Colonel J. J. Gerrard has embarked for a tour of service in the Sierra Leone Protectorate. Lieutenant-Colonel C. Dalton has been transferred from Ireland to the Aldershot Command. Lieutenant-Colonel F. S. Le Quesne, V.C., has been placed under orders for a tour of service in India. Lieutenant-Colonel F. W. Hardy has been selected to hold charge of the Military Hospital at Calcutta. Lieutenant-Colonel F. Caton Jones has taken up duty at Meerut Cantonment.

Major G. T. K. Maurice has been appointed Senior Medical Officer of the Officers Training Corps Camp at Salisbury Plain. Major L. P. More has been transferred from Secunderabad Cantonment to Wellington. Major J. Matthews has been appointed to the Northern Command. Major A. G. Thompson has arrived home from India. Major E. F. Q. L'Estrange has been appointed to the Irish Command. Major H. P. Waller Barrow has been appointed Deputy Assistant Director-General at the Medical Division of the War Office, vice Lieutenant-Colonel B. H. Scott. Major E. E. Parkes has embarked for India. Major P. J. Probyn, D.S.O., has been appointed Senior Medical Officer in charge of the Officers Training Corps at Hagley Park Camp. Major St. J. B. Killery has taken up duty at Lucknow. Major H. K. Palmer has been appointed to the Southern Command. Major J. V. Forrest has taken up duty in the Medical Division at the War Office. Major E. T. Inkson, V.C., has been appointed Deputy Assistant Director of Medical Services to the Wessex Division. Major E. W. Bliss has been transferred from the Chatham District to the Military Hospital at Tidworth, Salisbury Plain. Major A. E. Hamerton, D.S.O., has arrived home for duty from Nyasaland. Major J. T. Johnston has been transferred from Lucknow Cantonment to the Military Hospital at Naini Tal. Major R. Rutherford has joined at Cardiff.

Captain R. Storrs has been appointed to hold charge of the Military Families Hospital at Portland on transfer from Dorchester. Captain C. W. O'Brien has taken up duty at Pirbright. Captain D. M. Corbett has arrived home for duty from Ambala. Captain B. G. Patch has joined at Kirkee Cantonment. Captain W. J. Dunn has been granted six months' general leave of absence home from India. Captain C. W. Holden has taken up duty at the Royal Army Medical College. Captain J. T. McEntire has been appointed to the Cork District. Captain J. A. Turnbull has been transferred from the Military Hospital at Kamptee to Jubbulpore Cantonment. Captain R. J. C. Thompson has been appointed to the Chatham District. Captain W. F. M. Loughnan has arrived home for duty from Aden. Captain F. H. M. Chapman has joined at Delhi. Captain H. C. Winckworth has been transferred to the Quetta Cantonment from Woolwich. Captain C. H. Denyer has arrived home from India. Captain A. C. Elliott has been appointed to Colchester. Captain C. R. Millar has been transferred from Ballincollig to the Military Hospital at Cork. Captain G. O. Chambers has been appointed to the Military Hospital at Alexandria. Captain R. C. Paris has been appointed Specialist in Dermatology and Venereal Diseases to the Fourth (Quetta) Division of the Southern Army. Captain A. G. Jones has been appointed Specialist in Electrical Science and Radiography to the Second (Rawal Pindi) Division in India. Captain S. Field has arrived home from Jamaica. Captain J. M. Weddell has been transferred from the Military Hospital at Fyzabad Cantonment to Delhi. Captain E. B. Lathbury has been appointed to hold medical charge at Kilworth Training Camp. Captain W. K. Beamen has arrived home from Malta. Captain E. W. Vaughan has been appointed to hold medical charge of the Royal Artillery Practice Camp at Okehampton.

Lieutenant R. F. Bridges has been appointed to the staff of the Military Hospital at Cherat Cantonment. Lieutenant D. Reynolds has been transferred from Attock to the Sialkot Brigade. Lieutenant E. B. Allmett has taken up duty at Poona on transfer from Purandhar. Lieutenant T. J. Hallinan has been appointed to the Military Hospital at Mooltan Cantonment. Lieutenant W. L. E. Fretz has been transferred from the Ambala District to Peshawar Cantonment. Lieutenant C. M. Finny has been appointed to the Military Hospital at Barian Cantonment. Lieutenant R. Davidson has been transferred from the Eighth (Lucknow) Division to Meerut Cantonment. Lieutenant E. C. Deane has joined at Agra. Lieutenant J. D. Kidd has been appointed to the Military Hospital at Secunderabad Cantonment. Lieutenant T. E. Osmond has been transferred from the Sirhind Brigade to the Military Hospital at Lucknow Cantonment. Lieutenant W. McNaughtan has joined the Karachi Brigade. Lieutenant W. S. R. Steven has been appointed to the Military Hospital at Quetta Cantonment. Lieutenant R. T. Vivian has been transferred from the Bangalore Brigade to the Military Hospital at Secunderabad Cantonment.

INDIAN MEDICAL SERVICE.

Lieutenant-Colonel S. B. Smith has been appointed to officiate as Sanitary Commissioner in the Punjab. Lieutenant-Colonel C. P. Prall has taken up duty as Superintendent of the Central Prison at Lucknow. Lieutenant-Colonel E. P. Maynard has been granted six months' combined leave of absence home from India. The services of Lieutenant-Colonel E. Jennings have been placed at the disposal of the Home Department. Lieutenant-Colonel R. Bird, M.V.O., C.I.E., has been granted six months' combined leave of absence home from India. Lieutenant-Colonel D. H. Graves has taken over medical charge of the 72nd Punjabis.

Major G. P. Groube, medical officer of the 113th Infantry, has been appointed to officiate as Civil Surgeon of Lakhimpur, in addition to his regimental duties, during the absence on special duty under the Government of Bengal of Major W. V. Coppinger. The services of Major J. M. Woolley have been placed permanently at the disposal of the Government of Burma. Major R. E. Lloyd has been confirmed in the appointment of Professor of Biology at the Government Medical College, Calcutta. Major W. D. Hayward has joined at Madras. Major E. C. Hepper has been confirmed in civil employment in the United Provinces of Agra and Oudh. Major E. O. Thurston has been appointed to officiate as Professor of Surgery at the Government Medical College, Calcutta, and Surgeon to the College Hospital. The services of Major J. Woods have been placed at the disposal of the Government of the Punjab for employment on plague prevention duty. Major W. V. Coppinger has been appointed to officiate as Ophthalmic Surgeon at the Government College Hospital, Calcutta. Major R. M. Dalziel has been granted one year's combined leave of absence home from India. Brevet-Major S. R. Christophers has been appointed to officiate as Director of the Central Research Institute at Kasauli Cantonment during the absence on leave of Major W. F. Harvey. Major V. E. H. Lindesay has been appointed to officiate as Civil Surgeon at Shahabad. Major J. H. Hugo, D.S.O., has been appointed Agency Surgeon at Baghelkhand.

Captain G. S. Husband has been appointed to officiate as Superintendent of the Central Prison at Mooltan. The services of Captain G. Holroyd have been placed temporarily at the disposal of the Government of the United Provinces of Agra and Oudh for employment in the Prison Department. Captain H. C. Keates has been appointed to officiate as Civil Surgeon and Superintendent of the Prison at Attock. Captain A. Whitemore has been appointed Police Surgeon and Pathologist to the General Hospital at Rangoon. Captain E. C. Taylor has taken up duty at Kurram.

Army Medical Service.

Surgeon-General Sir William L. Gubbins, K.C.B., M.V.O., is placed on retired pay (dated June 1st, 1914). Surgeon-General Sir Arthur T. Sloggett, C.B., C.M.G., honorary surgeon to the King, to be Director-General, and to rank as Lieutenant-General, vice Surgeon-General Sir W. L. Gubbins, K.C.B., M.V.O. (dated June 1st, 1914).

Colonel Richard W. Ford, D.S.O., to be Surgeon-General, vice Sir W. L. Gubbins, retired (dated June 1st, 1914). Colonel Tom P. Woodhouse, from the half-pay list, to be Colonel, vice R. W. Ford, D.S.O., promoted (dated June 1st, 1914).

Special Reserve of Officers.

Royal Army Medical Corps.

The undermentioned to be Lieutenants (on probation):—Cadet Lance-Corporal James Melvin, from the Aberdeen University Contingent, Officers Training Corps (dated May 7th, 1914). Cadet William Walker, from the Aberdeen University Contingent, Officers Training Corps (dated May 7th, 1914). Cadet David Murdoch Marr, from the Aberdeen University Contingent, Officers Training Corps (dated May 8th, 1914). Cadet Corporal John McCallum Orme, from the Edinburgh University Contingent, Officers Training Corps (dated May 13th, 1914).

Territorial Force.

Royal Army Medical Corps.

North Midland Mounted Brigade Field Ambulance, Royal Army Medical Corps: Captain Arthur C. Goodwin to be Major (dated June 3rd, 1914).

3rd South Midland Field Ambulance, Royal Army Medical Corps: John Percy Ingham Harty to be Lieutenant (dated April 1st, 1914).

Attached to Units other than Medical Units.—Captain William M. Mackay to be Major (dated March 26th, 1914).

Lieutenant Geoffrey S. Hett resigns his commission (dated June 3rd, 1914).

Deaths in the Services.

Surgeon-Major-General Robert Lewer, at Southsea, on May 30th in his 81st year. He received his first commission in 1857, having previously served in the Royal Navy, was appointed brigade-surgeon in 1882, surgeon-colonel in 1886, and retired with the rank of surgeon-major-general in 1895. He served in the Russian war, 1855, and with the Baltic expedition. He was present at the bombardment of Sweaborg (medal), and served in the Afghan war, 1878–80. He took part in the night attack on rear guard of June 6th, 1879, the operations around Kabul and Sherpur, the defence of Sherpur, the march from Kabul to the relief of Kandahar, and battle of Sept. 1st (mentioned in despatches, medal with two clasps, and bronze star).

The Military Surgeon.

From the May issue of the *Military Surgeon* (Chicago) we learn that the New Field Service Regulations of the United States Army have increased the total strength of a division by 14·74 per cent., but have decreased the relative strength of the medical department from 116 officers and 1005 men to 92 officers and 826 men. The divisional field hospitals are reduced from 4 to 3, but the medical department hopes to increase the capacity of these that are left. A regiment in peace has a combat equipment, litters (carried on ammunition wagons), and an aid station equipment (carried on the regimental pack mule); these always remain with the regiment, even when in brigade, or division, or in war, but the regiment in quarters or training by itself has attached—not assigned—to it a wagon belonging to the divisional sanitary train and marked "Sanitary Train ...... Division." This wagon carries in peace time and on detached service the regimental field hospital. When the regiment joins its division for war this wagon joins the other 11 wagons of the divisional sanitary train. Eight carry the field hospital equipment, the others each carry regimental infirmaries, one practically for each brigade. The "trains" belong to the divisions, "columns" to the line of communications. "Sanitary" service in the United States army, as on the continent, includes all the medical services as well as those specially preventive in function.

Captain Louis C. Duncan gives a very valuable account of the wounded at Ojiinaga (January, 1914) in Mexico, close to the United States frontier. Both the armies were wretchedly equipped, the soldiers filthily dirty; the battles were fought in clouds of dust ("one breathes it and eats it"). There was no sanitary service, apparently no one to care for the "patient, dog-like" wounded. "The Mexican army was a mediæval army in all but firearms," yet of 200 wounded who were received into hospital some three miles from the battle only 10 died. There were no severe cases of pyæmia or septicæmia, none of erysipelas or tetanus. Wounds of spine were fatal; patients recovered astonishingly from wounds of chest and abdomen; there was almost no shock. Captain Duncan was lucky, he thinks, in finding a moving picture man's tent (50 × 25 feet) weighing 800 pounds. It held 45 patients in cots in three rows, was perfectly lighted, being white, and required only two lights at night. The patients who remained had ultimately to be carried 70 miles in wagons. "The Mexican soldier who was wounded was in luck if he had a woman along." One mother did the 70 miles crouching in a wagon beside her desperately wounded boy. They also did the dirty, disagreeable work the men refused to do.

The British is not the only navy short of medical officers. A special Bill has passed Congress allowing a former naval medical officer "on account of his fitness, his excellent record, and the urgent need of more medical officers in the navy," to rejoin with his old position on the list at his retirement six years ago. The officers of the United States Naval Medical Department are very pleased to think that at Vera Cruz their men have suffered less from malaria than those of two other nations lying alongside. This they believe due to their lectures to their men against mosquitoes, screening ports, daily prophylactic doses of quinine, all men down below after dark but those on duty, and they wearing gloves and veils.

Society for Relief of Widows and Orphans of Medical Men.—The annual general meeting of this society was held on May 27th. The report stated that the year 1913 marked the 125th anniversary of the foundation of the society, and that a munificent legacy of £37,250 had been received from the trustees of the late Mr. James Brickwell. The income from this legacy—namely, £1331 10*s.* per annum—will be available for the increase of grants to widows over the age of 65 by £25 per annum and under the age of 65 by £10 per annum. Grants under the Copeland Fund may be increased by £20 per annum, and grants to orphans may be increased in certain cases by £15 per annum. The invested funds of the society amount to £139,500. from which sum is derived in interest £4511 10*s.*, and £330 8*s.* was received in annual subscriptions and donations. During the year 1913 the sum of £3760 was distributed among 46 widows and 10 orphans. On Dec. 31st, 1913, there were 46 widows and 13 orphans on the funds. Since the last annual meeting five new members of the society have been elected and seven have died. At the present moment the society consists of 300 members, a very small proportion of the number of medical men who are eligible for membership. This is to be regretted, for the advantages of joining the society are considerable, especially to the younger members of the profession. Membership is open to any registered practitioner who at the time of his election is resident within a 20-mile radius from Charing Cross. Should any member remove beyond the limits of the society he still continues to be a member. The annual subscription is 2 guineas, the payment of this sum for 25 years constituting the subscriber a life member. Further particulars and application forms may be obtained from the secretary, 11, Chandos-street, Cavendish-square, W. A special general meeting of the society will be held on June 24th to confirm the alteration of certain by-laws.

MEDICAL PRACTICE UNDER THE INSURANCE ACT.

(BY OUR SPECIAL COMMISSIONER.)

(Continued from p. 1492.)

XLVII.—UNANIMITY IN THE BURY ST. EDMUNDS AREA.

FROM Colchester I went to Bury St. Edmunds, taking that city as a typical agricultural centre. The impossibility of staying at more than a certain number of places during such an investigation as that which I was engaged upon forced me to omit, at any rate for the moment, the larger and more commercially important town of Ipswich.

Bury St. Edmunds, the ancient capital of Suffolk and the seat of the new East Anglian bishopric of St. Edmundsbury and Ipswich, is the centre of a division of the British Medical Association which is almost identical with the newly formed Bury St. Edmunds insurance area. Newmarket, on the Cambridgeshire border, is also included in the Bury St. Edmunds insurance area, but the interesting and ancient little town on the Norfolk border, Thetford, has been handed over to the Norfolk insurance area. The West Suffolk insurance area is about the same as the county council area, and much of the insurance work is done in its centre, Bury St. Edmunds. The city of Bury St. Edmunds has a population of 16,785; but the surrounding purely agricultural country is fairly well populated, and there are about 35,000 insured persons in this area, with a panel of 59 doctors. But some of these doctors do not actually reside in the West Suffolk area; they live on the outskirts. Indeed, for eight of them most of their work is not within the area. Such overlapping renders the gathering of statistics very difficult. Every available practitioner went on the panel except one doctor, who could not overcome his antipathy to the new legislation.

How the Act Works in the Bury St. Edmunds District.

At Bury St. Edmunds, as at Colchester, the members of the medical profession were in the negotiation stages of the Act unanimously in opposition. When ultimately they yielded, they attributed the fault to their geographical neighbours rather than to themselves. It was the overlapping of medical practice from other districts that made the Bury St. Edmunds district fear the danger that doctors who had given way elsewhere would overrun the places where the doctors still held out. West Suffolk doctors were afraid of the men of Essex, Cambridge, and Norfolk, just as I had found the doctors at Colchester complaining that they could not rely on the medical profession around them if any continued stand were made. The Insurance Committee are still accused of subtlety in their way of conducting negotiations and of intimidating the local practitioners. A circular was sent round saying the panel would be closed on the ensuing Monday. Then came another circular that it would be closed without fail at 10 in the evening of the following Thursday, but after all the panel was kept open indefinitely. The members of the profession, however, did end by being panic-stricken and then they all went on the panel. Apparently they have been quite satisfied ever since. In any case there is no bickering and friendly relations are well maintained.

Speaking to one of the leading local practitioners, he explained to me that as a result of the Act he had lost some private practice among domestic servants and small tradesmen. But instead of 200 club members at 5s. each he had 600 insured persons at 7s. each, and this more than covered his loss in private practice. The longest panel list in the area numbers, I ascertained, about 2000; there is a firm with 3000, but it is composed of three partners.

Here, as at Colchester, the members of the old clubs have remained faithful to their original club doctors. But it was pointed out to me that the abuses for which club practice has become notorious did not prevail at Bury St. Edmunds. This bears out a remark of mine, which I understand has been criticised, that now and again the old medical aid associations worked without injustice. There were no bad clubs in this district paying 2s. 6d. or 3s. per head per annum for all sorts of medical attention and drugs. On the contrary, instead of such monstrous capitation fees or even the usual 4s. the sum generally subscribed was 5s. a year, and the members of the clubs did not complain of carelessness on the part of their medical officers. On the other hand, I could find no evidence that the Act had done anything that enabled insured persons to obtain better treatment than they were in the habit of receiving as members of clubs and Friendly Societies.

That being the case, there are a certain number of small tradesmen and others who would much prefer paying fees than to be treated as contract patients under the Act. But if they are willing to pay medical fees they are not willing to pay income-tax, and therefore they have enrolled themselves under the Insurance Act, as a proof that they are below the attention of the Income-tax Commissioners. As an instance in point, I was told of a youth of the neighbourhood who, accompanied by members of his family, called on his panel doctor, when a long examination and consultation ensued in regard to a nasal polypus. After much discussion it was decided that the youth should go to London to have the polypus removed. The panel doctor naturally felt it rather hard that this 7s. a year patient, after giving him so much trouble, should pay a fee to some London surgeon which would amount to at least 5 guineas; the inevitable question was whether a patient who could on occasion find such sums of money was fairly within the contemplation of the scheme of the Act. The incident is related not as an individual case, but as one of many showing that insured persons are often well able to pay the usual medical fees.

In the Bury St. Edmunds district the calling on insured servants was brought to my attention as being often a troublesome duty for panel practitioners; such visiting entails a greater sacrifice of time than should be expected for contract work. As a rule, not only has the servant to be seen, but the servant's mistress then wants to know all about the case. She asks whether she ought to keep the servant in the house, how long the illness is likely to last, and is it necessary to get another servant. To discuss all these points may take up a long time, while irksome questions of duty in the matter of professional confidence may always arise. But the panel practitioner cannot cut such interviews short for fear of losing as private patients the family employing the servant.

Attempt to Avoid Election of Panel Committee.

In regard to the Medical Committee and the Panel Committee I found the position at Bury St.

Edmunds somewhat similar to what I had seen at Colchester. The action of the medical profession in regard to these bodies has been firm and very unanimous. Indeed here, as elsewhere, the agitation in regard to the Act has done much to weld the profession together. At the outset hostility to the Act was such that when the Insurance Committee first appointed its Medical Benefit Subcommittee there was not a single medical man on it. After a while, however, not only was a medical man secured for this committee, but eventually a practitioner of Bury St. Edmunds who had taken a very prominent part in the organisation of the profession was selected. Fortunately, the shortage of medical men on the subcommittee led to no trouble. Though the Act has been in force for more than a year, no complaint whatsoever has been made against any doctor in the area.

The Local Medical Committee was constituted on March 13th, 1913. Twelve members were elected. The one doctor who, though in active practice, refused to go on the panel, was unanimously elected on the Medical Committee. Another doctor who is also not on the panel, but who is not in active practice, was likewise elected to the Medical Committee. The remaining ten members of the Medical Committee are all panel doctors. It will be seen, therefore, that efforts were made to secure the representation of every possible interest on the Medical Committee. But the new regulation insisting on the election by panel doctors only of a Panel Committee produced difficulty. At Bury St. Edmunds no one wanted this committee, as, with but the two exceptions mentioned above, it would be a mere duplication of the Medical Committee. However, there is a clause which says that where no Panel Committee is formed the Commissioners might recognise any existing committee. Therefore nothing was done, and after waiting till the last day for electing a Panel Committee had passed the Commissioners were written to and invited to recognise the Local Medical Committee as the best existing committee. The Commissioners, however, refused to see the matter in the same light. Though the date for electing a Panel Committee was passed they insisted that such a committee should be elected. An inspector even was sent down by the Commissioners a little before Christmas (1913). Then 20 nomination forms for the Panel Committee were sent to the secretary of the Medical Committee. Thereupon a general meeting of the profession was convoked, and they proceeded to elect a Panel Committee on their own lines.

Funds for Medical Organisation Secured by Law.

The problem has arisen in many places whether the profession shall go through the form of keeping both the Medical and the Panel Committees in existence. In this matter the financial aspect of the question has also to be considered. The Medical Committee has no other resources save that of voluntary levies paid by its members. The Commissioners seem desirous of doing away with the Medical Committees, so as to give all the power to the men who are working the Act, but at Bury St. Edmunds it is the same men who are on both committees, a position that has arisen elsewhere and is bound to continue to arise. The Commissioners will not effect any real change if the Medical Committee does cease to exist. The Medical Committee met 24 times last year. This means sending out notices, keeping a book of minutes, and a good deal of work which generally has to be done by one or two devoted members. Such work ought not to be gratuitous, and the Panel Committee have powers to make a levy.

From all this there arose the present very interesting situation. Throughout the country there are many insurance areas where practically all the medical men in active practice are on the panel. This is notably the case at Southend, Colchester, and Bury St. Edmunds, the last three places I have visited. It does not mean that the Insurance Act was readily accepted; on the contrary, a very stout and unanimous resistance was made. The fact that all the doctors are on the panel only means that, as the Act could not be prevented, it was best to control its operations as far as possible. Now that official Panel Committees have been created this is much more easy than formerly. Formerly the great difficulty was the want of money to pay secretaries and working expenses generally. But to-day the Panel Committees have powers to make compulsory levies—that is, to deduct a halfpenny or more from the floating sixpence: money thus obtained only to be spent for administrative purposes and in a manner approved by the Commissioners. The latter, however, cannot exercise any control whatsoever over a voluntary levy. On the other hand, a good many practitioners might object to pay the levy. But the position is quite changed. The practitioner can hardly avoid a levy now; he can only decide which sort of levy he prefers—a compulsory levy imposed by the Panel Committee with the money so raised controlled by the Insurance Commissioners, or a voluntary levy of about the same amount, but which the subscribers would themselves control and spend in the way they thought best.

(To be continued.)

Home and Foreign Notes.

(FROM OUR OWN CORRESPONDENTS.)

LIVERPOOL.

Liverpool Hospital for Consumption and Diseases of the Chest.

THE fiftieth annual report in connexion with the Liverpool Hospital for Consumption and Diseases of the Chest, which was presented at the annual meeting held recently, showed that the hospital in Mount Pleasant and the sanatorium at Delamere Forest are fulfilling an important and beneficial work for the community. The Lord Mayor, who presided, moved the adoption of the report. It was to be regretted, he said, that the resources of the laboratory attached to the hospital could not be utilised to their fullest extent owing to financial difficulties. The Government had appointed a medical research committee to direct research into the problems connected with tuberculosis. There were funds available for the purpose, but up to the present no grants had been made. State aid was not forthcoming, and the scientific study of tuberculosis, which was a national question, was left to private endeavour and philanthropic effort.

School After-care.

The chief subject of discussion at the last meeting of the Liverpool education committee was a suggested change in the method of ensuring the after-care of children. It was proposed that the control of this work should be transferred from the control of the medical officer of health to the school attendance and care subcommittee. Dr. J. G. Moyles said that nobody had done more for the health of the school children than the schools medical officer (Dr. E. W. Hope), and yet the education committee without consulting Dr. Hope proposed to take out of his hands the following up and taking care of school children. The change was strongly opposed by several members, but was eventually approved.

Death of Mr. T. Moore Dawson.

I regret to announce the death of Mr. T. Moore Dawson, L.R.C.P. & S. Edin., one of the best-known medical practitioners in the city. Mr. Dawson had been in failing health for the last two years, and had recently retired to Hooton, where he died in his sixty-first year. He was for many years surgeon to the A and C Divisions of the Liverpool Police Force. He will be best remembered for his untiring energy in connexion with the Volunteer movement, for which he was awarded the V.D., finally rising to the command of the 2nd Field Ambulance, R.A.M.C., and the further distinction of A.D.M.S. of the West Lancashire Division. For the past 30 years he was closely connected with the St. John Ambulance Association, and he received recognition of his services by his appointment as an Associate of the Order of St. John of Jerusalem in England. As a judge in ambulance work and competitions he was greatly in demand.

June 2nd.

WALES.

Welsh Memorial Sanatorium.

About a year ago the Welsh Memorial Association purchased an estate and mansion near Talgarth at a cost of £15,600. It is about 600 feet above sea-level and looks out upon the Black Mountains and the Breconshire Beacons. The house has been occupied by patients for some months, but it has been decided to enlarge the accommodation at an additional cost of over £50,000. When the new buildings are completed there will be accommodation in the institution for 300 patients.

Coal Dust as a Nuisance.

The inhabitants of colliery districts have hitherto put up with the discomfort connected with residence in these localities and have apparently considered that they have no redress against the clouds of coal dust which are emitted from the surface workings. It is possible that they may not in the future be so complacent, for a butcher in the Pontardawe district has succeeded on appeal in obtaining an injunction against a colliery company, the coal dust from whose colliery was alleged to have been a serious nuisance to his slaughter-house, sausage factory, and stables.

King Edward VII. Hospital, Cardiff.

In spite of the large additions which have been made of late years to the Cardiff Hospital they have never been sufficient to cope with the number of patients eligible for admission. This has been partly due to the fact that although new buildings have been erected and wards have been equipped, the board of management has not been able to fill the beds provided owing to lack of funds for their daily needs. This very prudent course needs to be adopted no longer, and it has been decided that the last 50 beds available shall be placed at the disposal of the waiting patients. There are now provided at the Cardiff Hospital enough beds to justify the General Medical Council in recognising it for the purposes of a complete medical school, in connexion with which a sum of £60,000 has been promised to complete the school buildings conditionally on the Treasury making a sufficient grant for the maintenance, administration, and upkeep of the school. In addition to this sum Sir James Thomas, a colliery proprietor in the Rhondda Valley, has contributed £30,000 for the establishment of a physiological department.

Supply of Radium for Swansea.

The need for a supply of radium has recently been urged upon the board of management of the Swansea General Hospital by the members of the medical staff, and the question has been seriously discussed by the board, with the result that it has come to the conclusion that the expenditure involved is greater than it would be justified in recommending. In these circumstances it has been decided to form a limited liability company with a capital of £1500, for which sum 100 mgm. of radium can be obtained. The scheme, as outlined by two members of the medical staff, Mr. W. F. Brook and Dr. R. C. Elsworth, provides for the charge of a fee of £5 5*s.* a day for the use of the radium. It is anticipated that it may be required outside the hospital on at least 100 days during the year, so that after the lapse of two or three years the whole of the capital together with interest can be refunded to the shareholders, when it is intended that the radium shall be handed over to the hospital authorities.

June 2nd.

SCOTLAND.

Notification of Tuberculosis in Scotland.

In accordance with the Public Health (Scotland) Act, 1897, the Local Government Board at Edinburgh has issued to local authorities copies of Regulations providing for the compulsory notification as from July 1st next of cases of tuberculosis in Scotland. These Regulations provide for notification of all forms of tuberculosis and supersede those made by the Board two years ago for notification of pulmonary tuberculosis alone. Local authorities are instructed to send a copy of the Regulations to each medical practitioner in their districts. The Regulations follow closely the form and requirements of the earlier Order, except that notification is now required of cases of non-pulmonary tuberculosis as well as of pulmonary tuberculosis. Notification is to be made on the strength of evidence other than that derived solely from the tuberculin test. A notification fee of 2*s.* 6*d.* is payable to a medical practitioner in respect of each case occurring in his private practice, and 1*s.* if the case occurs in his practice as medical officer of any public body or institution, but no fee is payable to school medical officers. In so far as the new Regulations touch upon the work of school medical officers they have the concurrence of the Scotch Education Department.

Report of Lunacy Commissioners.

The Commissioners in Lunacy for Scotland have just issued their annual report. They state that on Jan. 1st last there were in Scotland, exclusive of insane persons maintained at home, 19,346 insane persons of whom they had official cognisance—an increase of 158 upon the previous year's total. The admissions into establishments during the year 1913 numbered 3682.

Housing Conference in Glasgow.

On May 26th and 27th a conference of representatives of Scottish local authorities was held in the Glasgow town hall to consider the practical administration of the Housing and Town Planning Act of 1909. Sir Thomas Hunter, town clerk of Edinburgh, presided. Among those who took part in the proceedings was Mr. T. McKinnon Wood, Secretary for Scotland.

A Convalescent Home for Mothers and Infants.

The Broomfield Convalescent Home for Mothers and Infants was formally opened on May 30th by Mrs. Pearce Campbell in the unavoidable absence through illness of the Countess of Eglinton and Winton. This home has been founded by Mr. A. F. Yarrow for the treatment of recently confined women and their infants. It is situated in six acres of ground upon the shores of the Gareloch at Shandon. The home is under the care of Professor Robert Jardine, of Glasgow, and Dr. Leonard Findlay, physician to the Glasgow Royal Hospital for Sick Children. Each mother received into the home is entitled to remain for a fortnight. All the rooms were occupied by patients with their infants on the date of the opening ceremony.

Death of Professor George Dean.

I regret to announce the death on May 30th of Dr. George Dean, Regius professor of pathology in the University of Aberdeen. Professor Dean was 50 years of age and had held the chair of pathology for the past six years. He was a native of Aberdeenshire and a former student in the University of Aberdeen, graduating M.B. and C.M. with honours in 1889. He studied bacteriology in Berlin and Vienna. In 1897 he was appointed bacteriologist in charge of the serum department of the Lister Institute in London, and later became chief bacteriologist to the Institute.

Aberdeen Sanatorium and Central Dispensary.

The proposed scheme for a central city dispensary in Aberdeen, to be constructed in Golden-square, has received the sanction of the Local Government Board and of the National Insurance Commissioners, and the report in connexion with this and with the proposed joint sanatorium was passed at a meeting of the Aberdeen county council held on May 29th.

The Parkin Prize.

The triennial Parkin Prize of £100, in the gift of the Royal College of Physicians of Edinburgh, has been awarded to Dr. H. J. Johnston-Lavis. The subject set was: On the Effects of Volcanic Action in the Production of Epidemic Diseases in the Animal and in the Vegetable Creation, and in the Production of Hurricanes and Abnormal Atmospherical Vicissitudes. Dr. Johnston-Lavis for some years held the professorship of vulcanology in the Royal University of Naples.

June 2nd.

IRELAND.

Delegates' Meeting of the Irish Medical Profession.

A MEETING of delegates of the entire medical profession of Ireland was held last Tuesday in the Royal College of Surgeons, under the presidency of Mr. P. J. MacNamara. Each county and county borough was represented by five delegates. The report of the Irish Medical Committee was first read. It related the efforts made by the committee to come to an agreement with the Insurance Commissioners on a scheme for certification of insured persons, and their failure. The delegates decided to re-appoint the Irish Medical Committee with the same constitution; duties, and powers as before. Certain changes in the financial arrangements of the committee were recommended. The delegates passed the following resolutions: (1) reiterating the opinion expressed by two previous annual meetings of delegates that all medical certificates should be issued by the medical attendant, and (2) that any system whereby the primary certification of patients for sanatorium benefit is relegated to salaried officials to the exclusion of the medical attendant would prevent the discovery of early cases and their efficient treatment.

Conversazione at the Royal College of Surgeons.

On Friday evening, May 29th, the President of the Royal College of Surgeons and Miss Purefoy entertained a large party of guests at the Royal College of Surgeons to meet the Lord Lieutenant of Ireland and the Countess of Aberdeen. The military uniforms and academic costumes of the guests made an imposing spectacle in the beautifully decorated large hall. Refreshments were served in the library, and the orchestral band of the Royal Irish Constabulary, with songs by the Misses Purefoy and Mr. W. S. Haughton, provided entertainment.

Royal Medical Benevolent Fund Society: Belfast Branch.

At the annual meeting of the Belfast and District Branch of the Royal Medical Benevolent Fund Society of Ireland, held in the Medical Institute, Belfast, on May 22nd, it was reported that the net contribution of the branch was £139 13*s.*, a reduction of 10 guineas as compared with the previous year. The report stated that "an amount of apathy unhappily existed amongst a proportion of the medical practitioners in the district, who do not seem to consider this charity, the only one confined to the profession in Ireland, worthy of support." In Belfast 140 out of a total of 224 practitioners alone subscribe, but Belfast is not the only place in Ireland where the same state of affairs exists.

Ulster Medical Society.

At the annual meeting of the Fellows and Members of the Ulster Medical Society, held in the Medical Institute, Belfast, on May 28th, the following officers were elected for 1914–15:—President: Dr. J. S. Morrow. Vice-Presidents: Dr. John Rusk and Dr. A. E. Knight (Donaghadee). Council: Dr. A. G. Robb, Dr. J. C. Rankin, Mr. P. T. Crymble, Mr. T. A. Davidson, Mr. R. Reid (Whiteabbey), and Mr. John O'Doherty. Honorary treasurer: Mr. H. Stevenson. Honorary librarian: Dr. W. L. Storey. Honorary secretary: Dr. S. T. Irwin. Honorary editorial secretary: Dr. C. G. Lowry.

Antivaccination Campaign in Belfast.

The Belfast Poor-law elections have resulted in the complete rout of the antivaccination party, not one of whom has been returned. Indeed, with one exception they made a very poor show at the polls. One of the unsuccessful candidates issued a poster calling upon the electors to vote for himself and liberty.

Royal Victoria Hospital, Belfast.

The annual street and house-to-house collection in aid of the Royal Victoria Hospital took place on May 30th, and the total returns amounted to £684, which is an increase of over £100 from the districts concerned. Twenty-five districts have still to make returns, and it is expected the total this year will be close on £1200.

Death of Mr. Edward Taylor.

I regret to announce the death, at his residence, Bessmont Park, Monaghan, on May 24th, after a few days' illness, of Mr. Edward Taylor, L.R.C.P. & S. Irel. Mr. Taylor was formerly resident medical superintendent of the Cavan and Monaghan lunatic asylum at Monaghan; but some years ago was compelled by failing eyesight to resign. Within the last few years he became totally blind. Mr. Taylor studied medicine at the College of Surgeons School in Dublin, and qualified in 1869 as L.R.C.S., and in 1870 as L.R.C.P. He was held in very high esteem all around Monaghan. He leaves a widow and a son of 15 years.

June 2nd.

PARIS.

The Congress of Practitioners.

I REFERRED last week to this Congress, which was meeting at the time of writing, under the presidency of Dr. Gairal. It lasted four days. The question that occupied most time dealt with the number of representatives of the medical syndicates that would be accepted by the Minister of Labour for the commission created to regulate the differences relating to contracts between the mutual aid societies, and such like, and the medical men employed by them. Dr. Léon Labbé, the well-known surgeon, who is also a senator, made known on the part of the Ministry at the beginning of the Congress that the number of medical representatives in the grand council, which was originally three, would be raised to six. Dr. Le Fur and a large contingent of the Assistance Publique were for absolute refusal, in opposition to the Minister, that any member of the syndicates should take part in this commission. M. Hartmann and M. Netter advocated the view that medical men should take part in this commission, so as to know what took place there and to oppose as far as possible measures detrimental to the medical practitioners and to resign if they did not succeed. The Congress upheld Dr. Le Fur and named a delegation of 30 members to approach the Minister of Labour and make known to him the abstention of the syndicates. It also voted for a complete separation between practising medical men and those charged with official duties or administrative work, officialism being incompatible with the preservation of professional secrecy, the free choice of doctor by the sick, and freedom in the matter of fees. The Congress then adopted the conclusions of a remarkable report by Dr. Jacques Bertillon, calling urgently for the prosecution of the struggle against alcoholism, the cause of so much crime, madness, degeneration, and sterility.

The Congress of Forensic Medicine.

The Fourth Congress of Legal Medicine for the French-speaking medical profession took place recently at Paris under the presidency of Professor Guilhem, of Toulouse. Pleuro-pulmonary tuberculosis of traumatic origin was one of the principal subjects considered. M. Georges Brouardel, nephew of the late renowned authority on medical jurisprudence, presented a noteworthy report. Dr. Simonin, the delegate of the Minister of War, dealt with the same subject as regarded its application to soldiers. Communications were also made by M. Corin and M. Stokis on cadaveric phenomena; by M. Dufour on survival after wounds of the heart; by M. Régis and M. Martin on the necessity for a medical examination of young prisoners; by M. Ménard on fractures of the neck of the femur which permit of walking; by M. Du Bousquet on the possibility of recognising the medical man in attendance as a medico-legal expert on behalf of his patient; and by Dr. Gilbert Ballet on the validity of the wills of subjects of melancholia. Some curious cases were reported; a suicide by self-strangulation with the hands was narrated by M. Mégerand, and a case of spontaneous muscular rupture by M. Ribierre. M. Minet and M. Cordonnier spoke on the use of the polarising microscope in legal medicine, and M. Etienne Martin, of Lyons, on the possibility of crying out and speaking after wounds of the larynx and the lungs. M. Nicloux demonstrated the working of a remarkably simple apparatus of his own invention for determining the amount of carbon monoxide contained in the blood after poisoning by this gas. The next meeting was fixed for May 15th, 1915, at Liége, under the presidency of M. Corin, professor of legal medicine at the university.

The Opposition to Antityphoid Vaccination in the Personnel of Hospitals.

In my letter in THE LANCET of May 23rd I referred to this subject. M. Mesureur, director of the Assistance Publique of Paris, has justified before the Académie de Medecine the measures taken by him with regard to his own personnel, which includes more than 8000 male and female nurses, constantly exposed to contagion by soiled linen, dejecta, and other objects. In ten years more than 300 such persons contracted typhoid fever during their service, furnishing a mortality of 12 per cent. Antityphoid vaccination began in 1912, and was first administered to the personnel of the nursing school. At present there are two vaccinating centres in Paris for the hospital personnel, one for women at the Salpêtrière, the other for men at the Saint-Antoine. Up to date 1064 employees have been immunised and more than 4000 injections made without any accident. According to M. Mesureur, the opposition made by the syndicate is only the work of agitators, who on the least pretext thrust themselves into every conflict with the administration. All the academicians approved these views. M. Chantemesse, M. Vincent, M. Netter, and M. Chauffard took up the defence of antityphoid vaccination. M. Chauffard particularly cited the case of a male attendant in his service, whom he had hesitated to vaccinate because the man was affected at the time with a cervical adenitis, which gave rise to fears of unfitness for this procedure. But he had speedily to regret it, for the man contracted typhoid fever and died. Up to the present time, however, it was shown that the vaccination had never been made compulsory on the personnel of hospitals, but had been voluntary. Only the candidates for a post on the nursing staff find it required of them. The discussion will now probably cease.

June 2nd.

INDIA.

India's Sanitary Progress.

THE Government of India will shortly publish a general review of sanitary progress in India in which its policy in this respect will be defined.

Tuberculosis in India.

Dr. A. C. Lankester, of the Peshawar Medical Mission, has been selected, under arrangements of the Indian Research Fund, to conduct inquiries in connexion with the prevalence of tuberculosis in India.

Calcutta Health Officers.

The general committee of the Calcutta corporation has decided that in respect of one of the appointments the maximum pay of the grade—viz., Rs.700 per month—be offered to a specially qualified candidate with practical experience who will be capable of acting as health officer, and will be required to sign an agreement to remain in the service for at least five years. Thirty-two applications have been received. The health officer has examined the applications, and has given his opinion as to the three best qualified candidates. It was resolved that the question of selection be referred for consideration and report to a subcommittee.

The Milk-supply of Calcutta.

A report just published by the chemical examiner to the Government of Bengal shows that the authorities at certain hospitals had a good deal of trouble with their milk-supply last year. But Calcutta has not only to complain of an unsatisfactory supply of fresh milk. The Bengal Chamber of Commerce has been concerning itself with the inferior quality of some of the condensed milk that is supplied in tins, alleging that before condensing the manufacturers skim off the cream. Last year the Government of India decided that all condensed milk imported into India, which analysis showed had been prepared from a milk containing less than 3 per cent. of fat, should be marked "prepared from skimmed milk"; and, further, that the condensed milk should contain a higher percentage of fat in proportion to the degree of concentration, 3 per cent. of fat being the proportion of uncondensed milk. It is now proposed to revise the system so that the classification of condensed milk should be based on a fixed percentage of fat for each tin. It is proposed to allow a minimum proportion of 12 per cent., and in cases where this amount is not reached the tins should be marked "prepared from skimmed milk."

Water Famine at Bombay.

Bombay is just now passing through a season of water famine. The irregular supply of water is causing great hardship. The cotton fires at Colaba have drained a large quantity of the reserve during the last month and are the chief source of deficiency.

Paying Patients in Indian Hospitals.

The Government of the United Provinces has decided upon a step in the right direction which was bound to be made sooner or later, and one which it may be safely assumed the other provinces will eventually follow. That which is given away is never appreciated at its proper value. The United Provinces Government has therefore resolved to give the people of those provinces the opportunity to realise fully the benefits of Western medical science and skill by making them pay for it. The important resolution notifying this fact will be read with interest in the Punjab, where the subject is no new one. The resolution points out that hospitals wholly or in part supported by public funds are not, and never were, intended for the relief of patients who can afford to pay for the treatment they receive, but for the poorest classes only, and quotes a Government Order as far back as 1886 in proof thereof. Hitherto Government has contented itself with the enunciation of this principle, deterred from its enforcement by the practical difficulty of differentiating between patients who can and cannot afford to pay, and also through fear of doing anything to hinder the growing popularity of the Western system of medicine and medical treatment. Attendance at hospitals and dispensaries in the United Provinces, however, has increased at such a rate of recent years that the practical difficulty of differentiation, if differentiation is insisted upon, is now overshadowed by the still greater practical difficulty, if it is not insisted upon, of the medical institutions of the provinces being unable to cope with the burden placed upon them. In the words of the resolution, unless measures are taken to prevent those who can afford to pay resorting to public hospitals, then "it may before long be beyond the power of the Government to provide adequately for the helpless and indigent who have the first claim on a form of public charity which is a direct charge on the general taxpayer"; and "in the opinion of the Government the interests alike of the public funds and of the private practitioner demand that action should be no longer delayed." The resolution then refers to recommendations made by the committee of inquiry under the presidency of Lieutenant-Colonel J. K. Close, I.M.S., in its report received by Government last November. The committee recommended that in all hospitals and dispensaries to which a medical officer of not lower rank than an assistant surgeon is attached action should be taken to prevent the admission of well-to-do patients and members of their families to the benefits of free medical attendance, and urged that conspicuous notices should be posted in prominent places to the effect that the hospital or dispensary is a charitable institution and is intended only for the treatment of the poor. The Lieutenant Governor, the resolution announces, finds himself in agreement with the general tenour of the committee's findings, and action on these lines is to be taken. As is pointed out, this new departure can only be made effective with the coöperation of local bodies, by whom the majority of medical institutions are maintained or aided, and it is confidently anticipated that they will see the desirability, in their own interests, of coming into line with State-aided and State-maintained institutions. There is, very wisely, to be one important exception to the policy of enforced payment—in the Dufferin Hospitals no charge is to be made, it being considered undesirable to do anything that might jeopardise the slow-growing popularity of medical relief for women.

Sanatorium for Consumptives.

The Bihar and Orissa Government is looking for a suitable site for a sanatorium for consumptives. The claims of Hazaribagh and Ranchi were first considered, but judgment was pronounced against them, and the Government is now looking for a site outside the province. Naini Tal in the United Provinces and Dharampur in the Punjab have each been advocated, but with such an arrangement the Biharis do not concur while there are such healthy localities as Puri, Deoghur, and Koilwar to be found in the province.

Precautions Against Plague at Travancore.

The native State of Travancore is one among the few places which have not yet had a serious outbreak of plague. Of late, however, much anxiety has been felt that it might at any time make its appearance owing to the fact that the surrounding country, especially Coimbatore and Ceylon, are infected. The Travancore Darbar are taking all precautions. Any person arriving from an infected area is subjected to a medical examination for ten days from the date of arrival. A special staff has recently been appointed for this purpose.

Sanitation in Lahore.

In a letter to the papers Mr. C. A. Owen, the officiating health officer of Lahore, says that the system of subsidising zemindars to carry away the excreta of the town and civil station is faulty in the extreme, and that it is not possible to dispose of it in this way without grave effects on the health and comfort of the inhabitants. The filth drops on the road and merges with the dust. Then a breeze or a passing motor whirls the contaminating material into the nose, eyes, and mouth of every passer-by. It is not enough that every householder should see to the cleanliness of his own little sanitary department. That will not meet the case as long as the stuff has to be carried away by human agency. What is required is a system that will carry away all excreta directly before it is deposited in depôts. Such a system is the only sure safeguard, as other measures must fall short of efficiency.

May 7th.

AUSTRALIA.

Federal Quarantine.

Dr. J. H. L. Cumpston, the Director-General of Quarantine, has published by direction of the Minister of Customs a pamphlet defending the system of quarantine adopted in Australia. It is claimed that the practice is based on the procedure followed by all the leading European nations and America.

Small-pox in Sydney.

Considerable dissatisfaction has been expressed at the announcement made by the New South Wales Board of Health that in future small-pox contacts would not be isolated at the quarantine ground, as it was unable to find accommodation. At a conference last November it was agreed by the various States that quarantine should be lifted from Sydney if patients and contacts continued to be isolated. The quarantine station belongs to the Commonwealth, and it recently notified the State Board that contacts must be housed elsewhere. The board replied by the intimation that it could not isolate them at all. A statement has been made by Mr. Groom, Federal Minister of Customs and Quarantine. He said that the State officials had been informed some months ago that the station would be required for overseas cases of disease, and the arrival in the meanwhile of two mail steamers with small-pox patients had compelled the Commonwealth authorities to insist on the removal of contacts sent from inland. The whole history of the Sydney epidemic discloses the unworkable nature of the present system of quarantine in which authority is divided between two sets of officials. Dr. R. T. Paton (the State Director of Public Health in New South Wales) has frankly admitted there is a breach of the agreement with other States, but says there is no place where contacts can be isolated and that his State finds it impossible to keep its agreement. The epidemic in Sydney has never completely disappeared, and within the past few weeks cases have been discovered in various parts of the suburbs in increasing numbers. The Acting Premier of Queensland has asked the other State premiers to urge a consideration of the matter.

Melbourne Medical School Jubilee.

The ceremonies arranged for the celebration of this event were inaugurated on April 29th by a dinner at the Grand Hotel. The Governor of Victoria (Sir A. Stanley) presided over a large gathering, and various congratulatory speeches were made. The toast of "The Medical School" was acknowledged by Sir Henry Allen, and that of "Our Guests" by Sir Hartmann Just, of the Colonial Office.

Melbourne Hospital.

The last return issued for the quarter ending March 28th shows that the expenditure had increased over the corresponding period of 1913 by £2238. The members of the committee were considerably surprised to find such a marked increase, and some of them were alarmed. The chairman stated that a large part of the increase was represented by wages, as there had been numerous additions to the staff. It was resolved that a statement should be submitted giving the number of patients treated in the two periods.

Death of Dr. John Williams.

The death was announced on April 21st of Dr. John Williams, one of the oldest physicians of Melbourne. The late Dr. Williams, who was Welsh by birth, was a graduate of Edinburgh University, and came to Melbourne in 1870. He was soon after appointed outdoor physician to the Melbourne Hospital, and from that time till 1904 was an active member of the staff, afterwards becoming indoor physician. In 1904 he retired and was made consulting physician. Dr. Williams had a singular gift for clinical teaching, and his name was a byword with generations of students at the Melbourne Hospital. He was also for some years lecturer on materia medica at the Melbourne University. He enjoyed a large practice as a consultant, and his reputation in his day was very high as a skilful and sagacious physician. He was president of the Medical Section at the first Australasian Medical Congress and for many years a member of the University Council.

April 30th.

EDUCATIONAL REFORM.—A large number of societies interested in education will take part in the educational conference to be held at London University on June 18th, 19th, and 20th, among them being the Ratan Tata Foundation of the University of London and the School Medical Officers' Association. The speakers will include Mr. N. Bishop Harman, who will deal with vision as affected by type in school books; and Dr. J. Kerr, research officer, London County Council, who will take for his subject the ventilation of schools. Dr. J. Letitia Fairfield, assistant medical officer to the London County Council, will also speak, and Mr. J. L. A. Paton, the headmaster of Manchester Grammar School, will open a discussion on Sex Instruction.

Obituary.

ROBERT MUSGRAVE CRAVEN, M.R.C.S. ENG., L.R.C.P. EDIN., D.P.H. CAMB.

Robert Musgrave Craven, who died suddenly at Southport on May 17th, was medical officer of health for the combined county districts of Westmorland. He was the son of the late Robert Craven, F.R.C.P., J.P., and was born in 1851 at Rothwell, near Leeds. His family removed to Southport while he was a boy. He studied at London, Edinburgh, and Liverpool, and qualified as M.R.C.S. Eng. and L.R.C.P. Edin. in 1873. In 1886 he took the Diploma in Public Health at Cambridge after an examination in which very few of a large number of candidates succeeded. Before entering on private practice at Southport he was resident surgeon at Worksop Dispensary; and he became later one of the honorary medical officers of the convalescent home at Southport. He took an active interest in the affairs of the town, and was well up in postal and railway matters, but he was never a candidate for municipal honours.

A colleague writes: "Mr. Craven was too frank and outspoken to make a conspicuous financial success of private practice, for he never hesitated to tell his most remunerative patients when their troubles were the result of their own indiscretion, and that they could remove them if they would without the aid of a physician. In 1889 he was appointed medical officer of health for the Westmorland combined districts, which include the whole of that county with the exception of the urban district of Kirkby Lonsdale, and he entered into his duties with a zest that never wore off. His cheerful manner and obvious sincerity enabled him to deal firmly with the owners of insanitary property and yet leave in their minds no sense of injury or of having been treated in any way but what was right and necessary, and he thus obtained great results with little friction.

Mr. Craven was one of the most efficient medical officers of health in the country. As he seldom attended medical or public gatherings of late years he was but little known to the younger members of his branch of the profession, who were sometimes surprised to find the high estimation in which his opinion, always severely practical, was held by their colleagues who were well acquainted with him."

On the formation of the Sanitary Corps of the Territorial Force he was offered and accepted a commission as major *à la suite*. He has left a widow, one son, and two daughters.

ARTHUR AUGUSTUS CÆSAR, L.F.P.S. GLASG., L.S.A. LOND.

THE death occurred at Pevensey, Sussex, on April 20th, of Mr. Arthur Augustus Cæsar, at the age of 74. He had resided at Pevensey for a good many years since his retirement from strenuous public service in the metropolis, where for 35 years he was a Poor-law medical officer of Mile-end. For nearly 20 years he was resident surgeon of the East London Children's Hospital, and for some time was the resident medical officer of the Tower Hamlets Dispensary. Mr. Cæsar was a native of Cork, being the fourth son of Dr. Henry Augustus Cæsar, principal of the Cork School of Medicine. He pursued his medical studies at Cork and at the London Hospital, and became a Licentiate of the Faculty of Physicians and Surgeons in Glasgow in 1866, and a Licentiate of the Society of Apothecaries, London, three years later. His death is sincerely mourned at the pretty little Sussex township, where Mr. Cæsar was a warm supporter of the various charitable institutions.

Correspondence.

"Audi alteram partem."

INTRAMUSCULAR INJECTIONS OF QUININE.

To the Editor of THE LANCET.

SIR,—In reply to the letter of Sir Ronald Ross in your issue of April 4th, 1914, I should like to make a few remarks on the subject of intramuscular injections of quinine. Your correspondent states that it has been shown that quinine is absorbed with very great difficulty from muscle and subcutaneous tissue, yet the experiments of Sir David Semple seem to me to show the reverse. This writer in his article on the Relation of Tetanus to the Hypodermic or Intramuscular Injection of Quinine says: "When large doses of quinine are given hypodermically to rabbits and guinea-pigs, they rapidly come under its influence, and death takes place in a few hours." He further states: "In the case of rabbits the lethal dose by the stomach would at least be double the hypodermic lethal dose." Surely one would infer from this that quinine is readily absorbed when injected into muscle. Further, clinical evidence of the absorption of quinine when administered intramuscularly is afforded by those cases of malaria in which quinine given by the mouth produces no effect on the temperature, which, however, is very quickly reduced to the normal line when the intramuscular method of treatment is substituted for the oral. Major A. C. MacGilchrist, I.M.S., showed that quinine given by the mouth is more rapidly absorbed than when given intramuscularly, but that the curve of absorption is more sustained in the latter case; in other words, in oral administration the maximum absorption occurred in about four hours, whilst intramuscularly the absorption curve was at its maximum from the eighth to the sixteenth hour. Thus it appears that normally quinine is more readily absorbed from the stomach. A possible explanation of the clinical observation that injections of quinine do good when oral administration fails is that in malaria the co-existing catarrhal condition of the gastro-intestinal tract may considerably inhibit the absorption of quinine. Sir Ronald Ross notes that "these injections still appear to be largely used." I agree that they are still very popular, but I think it unlikely that the practitioner in the tropics would give the care and the time necessary to their preparation unless he firmly believed that some material advantage was to be gained for his patient and unless his results from this mode of treatment were clinically more satisfactory than those obtained by the much simpler action of writing a prescription.

Your correspondent also writes: "Sir David Semple has shown the danger of tetanus attending injections, and it is to be noted that the case mentioned had some convulsions." From this I infer that Sir Ronald Ross means the convulsions which occurred in the case reported by me in THE LANCET of March 28th were in some manner related to the treatment which I adopted. If the convulsions were due to the quinine itself, then their occurrence is proof conclusive that the drug was absorbed; if, on the other hand, they were a manifestation of tetanus—as it seems to me is inferred—then, in my opinion, this patient would never have recovered. Clinically, the case referred to presented no similarity to tetanus as it occurs in man, and I consider that the convulsions had nothing to do with either the absorption of quinine or with tetanus, or any other infection incidental on the treatment. I would attribute these convulsions to the same cause which produced the coma—viz., toxins which had been liberated from the malarial parasites, and which, circulating in the brain, irritated the various centres.

Sir David Semple certainly showed in his experiments on guinea-pigs that the injection of quinine did produce conditions favourable for infection with "washed tetanus spores" injected into other sites. These experiments, however, have never convinced me that quinine injections as used in practice are dangerous, or that their administration requires the simultaneous injection of tetanus antitoxin, a condition which would place quinine injections beyond the reach of most practitioners. His experiments on guinea-pigs, which most closely resembled the lines of treatment by injection in man, were those in which $\frac{3}{4}$ grain of quinine was injected hypodermically into each of eight guinea-pigs. In only one of these was the tetanus bacillus subsequently isolated from the site of injection, the presumption being that the infection was autogenous. Now a dose of $\frac{3}{4}$ grain of quinine given to a guinea-pig of 500 grammes weight would correspond to injecting considerably over 100 grains to a man of 11 st. The conclusions were that quinine injections favoured the development of tetanus in two ways: (1) by paralysing the phagocytes; and (2) by a destructive action on the tissues at the site of injection. This being so, it seems to me that the larger the dose of quinine the more favourable would the conditions be for the development of tetanus. It would be interesting to know what percentage of guinea-pigs, if any, would develop tetanus after injecting 1/15 grain of quinine, which is the proportionate dose for a guinea-pig of 500 grammes weight, assuming that 10 grains is a suitable dose for a man of 11 st. I still think that Sir Patrick Manson was right when he said that "it was not the quinine that caused the tetanus; it was the tetanus bacillus, and this tetanus bacillus was introduced either on a dirty needle or in a fouled solution."

Finally, Sir Ronald Ross writes that "cases of malaria, even often in pernicious attacks, generally recover temporarily without any treatment at all." This may be so, but I have not seen any such cases; in the case recorded by me I feel sure that recovery would not have ensued without treatment, and I must therefore continue to express my faith in intramuscular injections.

I am, Sir, yours faithfully,
A. G. TRESIDDER, M.D. Lond.,
Jhelum, May 13th, 1914. Captain, Indian Medical Service.

DIATHERMY IN VESICAL HÆMORRHAGE.

To the Editor of THE LANCET.

SIR,—I am much interested in the letters under the above heading from Dr. C. E. Iredell and Mr. Ralph Thompson and from Mr. Frank Kidd. Both letters criticise my lecture on Tumours of the Urinary Bladder, which was recently published in THE LANCET, in that I made no mention of diathermy in the treatment of vesical tumours. My error, if such it be, is one of commission rather than omission, as I was fully aware of the work of Bell and other surgeons in this mode of treatment, but my personal experience of it was too limited to make any definite statement upon it. As, however, the omission has caused surprise to some of your readers, I trust I may be allowed space for a brief reply.

The letters published in THE LANCET of May 16th and 23rd last bring out two entirely different uses of diathermy. Dr. Iredell and Mr. Thompson write of the success in their hands of diathermy in the arrest of severe hæmorrhage for some months in four cases of advanced vesical carcinoma. In cases under my own care I have found so much relief given by the formation of a permanent suprapubic fistula, and the arrest of hæmorrhage under direct vision with the bladder opened has presented so little difficulty, that I have not tried the effect of diathermy. However, should a suitable case come forward in which hæmorrhage is the prominent symptom—apart from pain and the distressing increased frequency of micturition which so frequently accompany it—I shall certainly try it.

Mr. Kidd, on the other hand, would use diathermy in the radical treatment of a villous papilloma to the exclusion of operative removal and "does not believe that the bladder need ever be opened in the future for simple growths." Now one point I tried to emphasise in my lecture was the absolute necessity to remove not only the papilloma but the surrounding mucous membrane of the bladder at its attachment, to insure freedom from recurrence, and time alone will show if diathermy is as effectual in destroying the tumour cells at the base of the growth as their removal by open operation. Further, I attempted to show not only the close relationship between a papilloma and a villous carcinoma of the bladder, but the difficulty that may arise in the diagnosis between them in a cystoscopic examination. If we are to rely upon diathermy in the treatment of these cases I am sure that an early malignant vesical growth will occasionally be overlooked and valuable time in which a carcinoma may be eradicated with some hope of freedom from recurrence will be lost. For these reasons I look upon diathermy in the treatment of vesical tumour as still in an experimental stage, and accordingly cannot include it as a "standard method" of treatment.

I am, Sir, yours faithfully,
Wimpole-street, W., June 1st, 1914. R. H. JOCELYN SWAN.

INTRATHECAL TREATMENT WITH SALVARSANISED SERUM.

To the Editor of THE LANCET.

SIR,—That good can be effected in parenchymatous syphilis, notably in tabes dorsalis, by intrathecal injections is to my mind certain, but it must be conceded that this method of treatment has not yet passed the stage of probation. Admitting the principle, we have still much to learn as to matters of detail, and we can only arrive at a perfected technique (as to the medicaments to be employed, their dosage, the number of injections, &c.) by experience. It therefore behoves all physicians adopting the intrathecal method to make a careful record of the results obtained, not only as regards the general clinical features of the disease, but, what is even more important, the changes effected in the cerebro-spinal fluid.

The improvement which this treatment produces—e.g., in tabes—shows itself, as Dr. Gordon Spencer points out,[1] by a disappearance of the lightning pains and by a diminution in the incoördination; but, inasmuch as sceptics might be inclined to attribute such improvement to suggestion, it is desirable that careful records should be made of the effect of the treatment as regards such clinical features as the light reflex, the knee-jerks, and the weight of the patient. Observations on the light reflex demand particular care, and should always be checked by a second observer. The most accurate method of gauging the improvement brought about by the intrathecal treatment, however, is by observing the changes in the cerebro-spinal fluid. At every intrathecal injection a specimen of this fluid should be secured for testing purposes, and a record made of the Wassermann reaction, the lymphocyte count, the globulin reaction, and the percentage of albumin.

By comparing the results obtained by different methods in a large number of patients we shall be able to discover the most efficient one.

I am, Sir, yours faithfully,

Wimpole-street, W., June 2nd, 1914. HARRY CAMPBELL.

HELMINTHEMESIS.

To the Editor of THE LANCET.

SIR,—There is an interesting note on "helminthemesis" in THE LANCET of April 25th. It begins with the statement that "vomiting or expulsion by the mouth of intestinal parasites is a rare occurrence," and I would ask you to allow me to qualify this by adding the words "except in Persia." Here intestinal worms are exceedingly common, and I think I am safe in saying that every Persian is infected at one time or another in the course of his life, and that a large proportion of Europeans fails to escape. The common worms in the North of Persia are ascaris lumbricoides, oxyuris vermicularis, and taenia saginata, and they occur in this order of frequency.

So far is the vomiting of a round worm removed from being a rare occurrence that I now hear of the event with composure, though not a little astonished at its frequency when I first came to Tehran. I regret that I have not kept a record of the cases which I have met, but I can only say that they have been numerous. The expulsion of the worm is very often accompanied by serious general disturbance. I well remember the first case of grave illness to which I was called after arriving in Tehran eight years ago. It was that of a child aged 4 who was unconscious, with high fever, a rapid irregular pulse, and Cheyne-Stokes breathing. Meningitis was my diagnosis, but within 24 hours the child vomited a round worm and promptly got well. I have seen other cases of obscure and apparently grave illness, both in adults and children, terminated by the vomiting of a worm; I should say round worm, for I have never seen a tapeworm expelled from the mouth. To omit to give santonin in most cases of gastro-intestinal disturbance, and to many patients whose symptoms cannot be correlated with any definite diagnosis, might here in Tehran, to my mind, almost be dubbed mal-praxis!

Before closing I would like to describe a case of helminthiasis the like of which I have not read nor seen again. A child aged 7, wasted to skin and bone, face drawn with pain, fever, irregular bowels, and occasional vomiting. Abdomen full of lumps, some as big as hen's eggs, and tender. Diagnosis: tuberculous peritonitis. Prognosis: hopeless. Treatment: calomel and santonin in small doses, as a beginning. In three days the child was brought back looking a different creature and the lumps in the abdomen gone. Unfortunately I had been too sure of my diagnosis to order the results of my prescription, if any, to be brought for inspection. But the expressive gestures of the mother were sufficient to show that scores of round worms must have been expelled.

I am, Sir, yours faithfully,

H.B.M's Legation, Tehran, May 11th, 1914. A. R. NELIGAN.

RE-EDUCATION OF THE DEAF.

To the Editor of THE LANCET.

SIR,—In THE LANCET of May 23rd, p. 1449, Mr. Richard Lake has published an article on my method of treatment of deafness. In order to explain the lack of success which he has experienced, in contradiction to the results obtained in France during 15 years, results which are officially recognised by the Academy of Medicine, one of the three following hypotheses must be admitted: (1) Either he has modified the apparatus, however little, which has transformed the vibrations; or (2) he has turned his attention to patients who are not amenable to the siren (and this is evident at the end of a week's treatment); or (3) he has not followed the rules of clinical treatment.

I enclose my communication to the Academy of Medicine and the report of that body. In the interest of patients and medical men it would appear to me desirable that you should publish my letter and the report of the Academy in your journal.

There is no question here at all of a commercial matter, as in the case of other methods which Mr. Lake seems to confound with mine, since anybody who likes may construct my apparatus.

I am, Sir, yours faithfully,

M. MARAGE,

Docteur en Médecine et Docteur ès Sciences Chargé de Cours à la Sorbonne.

19, Rue Cambon, Paris, June 2nd, 1914.

*** We have translated Dr. Marage's letter. The communication to the Academy of Medicine (which we have not space to reprint) is entitled "Règles Acoustiques et Cliniques de la Ré-éducation Auditive," and is published by the author at his address.—ED. L.

A PRINCIPLE OF DIETETICS.

To the Editor of THE LANCET.

SIR,—It appears that the time has arrived when a subject interesting alike to physicians and the public generally should be discussed in the medical journals. It seems to me undesirable that medical men in authoritative positions should speak dogmatically to lay audiences upon subjects which they may not have studied closely and upon which there appear to be widely divergent views. I am prompted to suggest this discussion in THE LANCET by having had my attention drawn to some remarks by Dr. Robert Hutchison, reported in the *Times*, at a conference of teachers on domestic subjects. Answering questions, Dr. Hutchison said: "A good deal of nonsense was being talked about the effects of bad teeth. The most absurd instructions were issued, and in one leaflet he had seen it was stated that every meal was to end with raw fruit to clean the teeth out, and that the children were to have a raw apple each night before they went to bed, but nothing was said about a toothbrush."

---

[1] THE LANCET, May 30th, 1914.

It is not my intention to attempt to defend all that may be said as to how dental diseases may be prevented, and although no doubt the eating of an apple before going to bed might do the teeth no harm, for other reasons I certainly would not defend the procedure. At the same time, I am in most hearty agreement with the statement that every meal should end with raw fruit or food of a detergent nature so that the mouth will be physiologically clean at the end of the meal. To say that the advocacy of ending a meal with raw fruit in order to clean the teeth was a most absurd instruction seems to overlook a principle of dietetics of first-rate importance now recognised by many medical men in highly responsible positions—namely, that a meal should terminate in such a way that the mouth and teeth will be left physiologically clean. Indeed, on June 1st, 1912, in an article on Dietary Reform in Secondary Schools, THE LANCET said that "everyone will agree with the recommendation of raw fruit as a termination for a meal." To scout this principle leads not only to the destruction of the teeth from caries but also to "oral sepsis" and all its attendant consequences. To indicate that this principle can be flouted and that the evils resulting from ending a meal with non-detergent or unhygienic foods can be rectified by the use of a toothbrush is reverting to a system of preventing dental diseases which has been found in the past to be most unreliable and relatively inefficacious.—I am, Sir, yours faithfully,

Harley-street, W., June 2nd, 1914. J. SIM WALLACE.

"THE MENACE OF CANCER."

To the Editor of THE LANCET.

SIR,—The question, Is cancer on the increase? is no doubt extremely difficult to answer in the affirmative if accurate and reliable statistics on the subject be demanded as a necessary basis for the reply. Where such reliable statistics do not exist—which is, I imagine, the condition in most countries at the present time—it may be necessary for a community to make up its mind on the subject without them, aided by such figures as may be available and the general knowledge of the community. On account of the serious nature of the disease it would seem important for all communities to satisfy themselves on the point and to realise, as one of your correspondents puts it, "the seriousness of the cancer problem, ... the frequency of cancer occurrence," and the necessity "of arousing a public interest in the necessity of educating the public in the plain facts of cancer as a pre-requisite for a nation-wide campaign for cancer control"; and should an increase of the disease be evident, as Mr. Hoffman compels one to believe is the case in America,[1] it is of equal or greater importance to know the reason why. To judge from recent literature on the subject, Britain does not seem to be in any better case—e.g., the medical officer of health of Edinburgh in his annual report last year called pointed attention to the increase of this disease, the mortality from which has been for years almost the same as that from phthisis. An interesting letter appeared in the *British Medical Journal* of Feb. 14th last, p. 368, from "F. H.," with diagram, relating the occurrence of 17 cases of cancer along a four-mile stretch of road within the period of five years. Nor is this increase of cancer confined to Britain and America. South Africa is in an equally unfortunate condition. Speaking from personal experience during the last 29 years (for statistics we have none) at the beginning of that period cancer was decidedly a rare disease; it has increased in the white population gradually and continuously during these years, and to-day it is comparatively a common disease, so much so indeed that it is attracting public attention.

When a common condition is so widely spread there is probably a common cause. In the Physiological Section, British Association, 1913, Dr. F. C. Shrubsall, speaking on the relative fertility and morbidity of defective stocks, having studied 700 families, is credited with stating that consumption was extremely common among degenerate stocks, that insanity was infinitely more frequent in defective stocks, and that cancer was more frequent and infantile mortality ten times greater in defective than in normal stocks, a degenerate condition unquestionably showing a greater susceptibility to disease. It is, I think, generally accepted to-day that syphilis is the great agent by which degeneration of stocks is accomplished. Thirty odd years ago some of the older surgeons believed in a close relationship between syphilis and cancer: as I have heard it expressed by one of them, "people acquire syphilis late in life and die of cancer." This belief seems to have been "on the shelf" for a good many years, but is again finding expression in a cautious manner—e.g., Mr. D'Arcy Power, in his evidence before the Royal Commission on Venereal Diseases, at its twenty-second meeting, is reported as stating that "the expectation of life was materially shortened for a person who had been infected with syphilis; the immediate danger extended to the second generation, and the vitality of the stock seemed diminished for several generations. ...... It predisposed," Mr. Power thought, "to cancer and tubercle."[2]

In South Africa there seems little doubt that cancer favours syphilitics, and that the two diseases have increased side by side. The same is true of tuberculosis, the preference of which for syphilitics has been specially pointed out in papers by me in THE LANCET of May 11th, 1912 ("Report on an Enquiry into the Prevalence of Syphilis in the South African Native and its Influence in Aiding the Spread of Tuberculosis"), and of April 11th, 1914 ("The Mortality on the Rand: Some of its Causes"). South Africa has its full quota of physical and mental degenerates, the responsibility for the mass of which must be attributed to venereal diseases. In addition to these we have another disease which also seems to be dependent for its spread on the presence of a syphilitic foundation—viz., leprosy. Nor is this surprising in view of the close affinity of the organisms of leprosy and tuberculosis. So close that one asks, Are they distinct organisms or variations of the same organism? Possibly the development of Mme. Victor Henri's work may throw some light on this important matter in the near future. In 25 years the number of lepers in Basutoland has increased from 300 to 800. In Natal, along the Basutoland frontier, the increase of cases has been so great that the attention of the

---

[2] THE LANCET, March 21st, 1914, p. 846.

Government was called to it in the Union Parliament during the present session. In Europe the increase is also marked. In Paris, it is stated, the number of lepers has increased in a few years from 50 to 300. This is also true of Russia. India shows a like tendency, the increase being placed at 10 per cent. for ten years.

In consideration of these facts it would seem that, while not neglecting these various diseases, there may be a better way of directing a nation-wide campaign than against cancer, as suggested by Mr. Hoffman—viz., towards the elimination of venereal diseases. With its success one might venture to hope for the disappearance of most of the others to a very marked extent. The only army with which any hope lies of carrying such a campaign to a successful issue requires to be composed of the *children of the nation* who have received a common-sense education in those subjects which concern so nearly their own and the nation's welfare. "The foundation of every nation is the education of its youth."

I am, Sir, yours faithfully,
BENJAMIN G. BROCK.

Germiston, South Africa, April 30th, 1914.

THE CHEMICAL TREATMENT OF CANCER.

To the Editor of THE LANCET.

SIR,—The treatment of inoperable cancer by chemical agents is, in fact, that of the disease itself. If growths of long standing can be safely removed by their use greater success will be obtained when more recent growths are attacked. The basis of such treatment rests upon the fact that the bodily resistance to disease can be increased artificially by the exhibition of such chemical substances as the cinnamate of sodium and the orthocoumarate of sodium, and that an element destructive to the life of cancer cells can be introduced without involving the destruction of healthy cells. The introduction of colloidal copper has placed in my hands the coping-stone for which I have been seeking since 1903.[1] In 1912 D. T. Gaube du Gers published a paper in Paris, "De la Décancérisation," in which he published some cases treated with a colloidal copper solution, and I recognised the fact that the coping-stone for which I had been assiduously looking had been found. The successive steps taken have been published in THE LANCET,[2] and I claim that they have been taken in an orderly manner, and based upon a sufficient working hypothesis. Dr. Morgan, since 1903, has made various metallic organic compounds such as the coumarate of copper, but none of them have been found to be of practical therapeutic use owing to insolubility or other reasons. Dr. Martindale, of New Cavendish-street, has now made a solution which he is sending out in sterile form and which contains copper in the form of a protalbuminate or lysalbuminate, and he confidently asserts that the copper content is in a colloidal state and chemically very labile and reactive. From the therapeutic aspect there is no doubt that the solution is active, that it is well tolerated, and gives rise to no unpleasant reactions in patients.

I have administered 5 c.c. of this solution subcutaneously twice weekly to a patient suffering from advanced carcinoma of the liver, and Mr. C. B. Lockwood, who has seen the patient, thinks that there is extensive intestinal involvement in addition. On April 1st this woman, aged 64, was very deeply jaundiced, there was no bile in the motions, and the urine was the colour of mahogany. Vomiting and diarrhœa were incessant. After a fortnight's treatment there was definite improvement in the general condition of the patient, the large masses of growth had much diminished, and the vomiting had disappeared. After eight weeks' treatment the improvement was very marked, vomiting and diarrhœa were absent, the urine was less discoloured, and there was less pigmentation of the skin.

It appears, therefore, that the treatment of cancer can be successfully undertaken with the aid of chemical substances, and it is for this I have contended for many years past. During the last four or five years certainty existed in my mind that my chemical friends, Dr. Morgan and Dr. Martindale, would sooner or later provide me with the copper compound for which I was seeking, and when the latter sent me the colloidal copper solution I recognised the fact that success was secured. So much success had already been obtained with the aid of coumaric acid compounds aided by oleate of copper in the cases where the latter could be applied locally, that the only doubt remaining was as to the toleration of copper in the colloidal form by the patient in doses which would be sufficient for the attack upon large masses. This doubt has now been removed, and it can be asserted that there is no danger to the patient when colloidal copper is exhibited in the dose contained in 5 c.c. of Dr. Martindale's solution.

In conclusion, may I express the hope that no more will be spent upon the exploitation of radium as a cure for this disease? Its use has not been unaccompanied with grave disasters, and, if the truth is told, its therapeutic possibilities are limited to the treatment of easily accessible growths, and always will be. Growths situated even a comparatively short distance from the spot exposed to the rays must be uninfluenced by their action.—I am, Sir, yours faithfully,

June 1st, 1914. LOVELL DRAGE, M.D. Oxon.

TOUCHING FOR THE KING'S EVIL.

To the Editor of THE LANCET.

SIR,—In the last part of the Proceedings of the Section of the History of Medicine, Royal Society of Medicine (p. 234), Dr. Raymond Crawfurd added a note referring to the supposed bronze touch-piece of Charles I., for the first public announcement of which he thought we were indebted to Mr. Henry Symonds. I have looked up Dr. Crawfurd's reference to Mr. Symonds's announcement (*Numismatic Chronicle*, London, fourth series, 1910, vol. x., p. 395), and find that amongst "the accounts of the wardens of the exchange and moneys within the Tower" (1625–1649) Mr. Symonds specially noted an entry (1635–1636) recording the allowance of a payment to the chief graver "for making tokens used for the healing of the king's evil and delivered to William Clowes, sergeant chirurgeon, at *2d.* the piece; the number being 5500." Mr. Symonds proceeds: "This is an interesting discovery, proving, as it does, that Charles used a touch-piece of base metal when the gold angels had become too valuable to be distributed at such ceremonies." I do not think it proves anything of the kind. It is far more likely to my mind that the pieces in question were given as mementos to visitors allowed to watch the ceremony, or were used in some way as "passes" or "tickets" in connexion with the ceremony. There can, however, be no doubt that Mr. Symonds and Mr. Grueber are right in their suggestion that the bronze piece referred to is the one engraved in W. Boyne's "Seventeenth Century Tokens" (first edition, London, 1858, Pl. 36, No. 11), having on the obverse the design of a hand from the clouds over the heads of four men, and on the reverse a rose and thistle under a crown; the legend, partly on the obverse and partly on the reverse, is: HE TOVCHED THEM AND THEY WEARE HEALED. It may be here observed that Dr. T. J. Pettigrew already in 1844 had suggested that the piece in question was a touch-piece. He had it engraved amongst "royal touch-pieces" on the frontispiece to his book "On Superstitions Connected with Medicine and Surgery" (published by J. Churchill, London, 1844). By the style of the piece it must almost certainly belong to the reign of James I. or Charles I., but for the following reasons I think it cannot have been a real "touch-piece": 1. It is hardly ever met with pierced with a hole for suspension, like regular touch-pieces invariably are. 2. It is met with either struck from dies or as a *cast of the period*, like many other medalets of the Stuart sovereigns. 3. It seems very improbable that in 1635–1636 King Charles I. should have taken such a liberty with an ancient and cherished religious ceremony, as would have been the case had he used bronze instead of gold pieces in touching for the king's evil. Even the Stuart "pretenders," James III., Charles III., and Henry IX., during their most adverse times, never used touch-pieces of a metal inferior to silver when they "touched" (as they frequently did) for the king's evil. 4. Had bronze touch-pieces really been used by Charles I. instead of the proper gold pieces, it is almost certain that definite references to the fact would have come down to us in the literature and ordinary records of the time.

---

[1] THE LANCET, Nov. 7th, 1908.

[2] THE LANCET, July 12th, 1912, and Sept. 7th, 1907.

On all these grounds, therefore, I maintain that until further information is forthcoming the bronze pieces in question must be regarded as medalets or tickets of some kind connected with the ceremony of touching for the king's evil, but not as actual touch-pieces.

I am, Sir, yours faithfully,

F. PARKES WEBER, M.D. Cantab.

Harley-street, W., May 27th, 1914.

SOCIETY OF TUBERCULOSIS OFFICERS.

To the Editor of THE LANCET.

SIR,—Regarding the suggestion thrown out by Dr. Crowe in a letter in THE LANCET of March 21st that a society of tuberculosis officers should be formed, I am not aware that this has yet been taken up, but possibly the reason is that such officers are engrossed with the details of the organisation and development of their work. For various reasons it appears advisable for such a society to be formed, and it has occurred to me that an opportunity might offer itself during the forthcoming annual conference of the National Association for the Prevention of Consumption and other Forms of Tuberculosis in Leeds. A preliminary meeting might be called for the evening of Wednesday, July 8th, and if a sufficient response be made to this suggestion a suitable meeting-place could be selected. I shall be glad to learn the views of other tuberculosis officers.

I am, Sir, yours faithfully,

THOMPSON CAMPBELL, M.D. Glasg.

The Limes, Wakefield, June 1st, 1914.

THE STETHOSCOPE IN ENGLAND.

To the Editor of THE LANCET.

SIR,—In the interesting account of the dinner to celebrate the centenary of the Royal Hospital for Diseases of the Chest, City-road, published in your issue of May 16th, it is stated that Dr. Thomas Davies introduced the stethoscope into England in 1862. May I ask you to correct the date, which is misleading? It should be *1825* not 1862. Dr. Thomas Davies died in June 1839.

I am, Sir, yours faithfully,

ARTHUR T. DAVIES,
Senior Physician to the Royal Hospital for Diseases of the Chest, City-road, London.

Tokenhouse-yard, E.C., June 3rd, 1914.

THE NATIONAL INSURANCE ACT.

COMPLAINTS AGAINST LONDON PRACTITIONERS.

IN the monthly report on complaints against practitioners presented on May 28th to the London Insurance Committee was included a case in which the Medical Service Subcommittee found that a doctor wrongfully made a charge for services rendered, and that he refused to issue a death certificate until payment of 3 guineas was forthcoming. The latter allegation was denied by the doctor. Extenuating circumstances in the case appeared to be that the patient had been attended by another practitioner as a private patient, and on moving into another district came under the care of the doctor against whom complaint was made. The patient was in a very grave condition, and a conflict of evidence arose as to whether he was accepted as a private or an insured patient. On the documentary evidence available the subcommittee decided against the doctor on this point. Mr. O. E. Warburg, chairman of the subcommittee, mentioned that in this case the new form of procedure had been recommended of sending the papers to the Insurance Commissioners with a request that they would bring them to the notice of the General Medical Council. The dereliction of which the practitioner was found to have been guilty was not one concerning the *efficiency* of the medical service, the treatment having been quite satisfactory. A grave breach of professional practice was alleged, and the matter should come before the professional tribunal, which could deal with it adequately. The committee approved this course. In another case, in which a doctor was censured for a breach explainable by illness and had since died, Mr. Evan Jones moved the reference back with a view to the case being expunged from the records, but by a majority the committee rejected the motion.

DISTRIBUTION OF THE UNALLOTTED FUNDS.

The question of the distribution of the moneys accumulated in the Medical Benefit Fund in respect of insured persons who have not chosen a doctor was again before the London Insurance Committee on May 28th, when the special subcommittee, which was instructed a month ago[1] to prepare a scheme for distribution, recommended a method whereby an allotment would be made on paper to all practitioners on the panel of the whole amount in the Medical Benefit Fund for 1913—viz., £490,000 (including £28,436 for domiciliary treatment and the £91,000 unallotted money). Sums would be credited to each practitioner in accordance with the number on his list, the amount already received in the form of quarterly cheques during 1913 would be deducted, and a remittance would be sent for the balance. It was stated in the course of debate that the Insurance Commission had advised this as the proper and indeed the only possible course, but as it appeared that this information was not received in an official way, but only by word of mouth, and as various documents issued by the Commission seemed to contemplate alternative methods of distribution, the committee decided to refer the matter back to the subcommittee once more.

London Practitioners and the Budget Proposals.

The London Panel Committee has opened its meetings to representatives of the medical press, and at the first meeting held under these conditions resolutions were passed with the object of stating the professional view as to the best ways in which the money provided by the Budget to aid the establishment of laboratories, and for the provision of skilled nursing, &c., could be expended. The resolutions declared that the services of medical referees should be available to practitioners on the panel without fee, that the referees should not combine with these duties the ordinary duties of a consultant or be engaged in general practice in the same area. The conditions under which the services of nurses should be available to practitioners were defined, and it was declared that laboratories for chemical, pathological, and bacteriological examinations should be available to practitioners on the panel without fee, that arrangements should be made for closer coöperation between practitioners and institutions for specialised treatment, and that more hospital accommodation was needed in London for women. A deputation was appointed to place these views before the Chancellor of the Exchequer.

---

[1] The Lancet, May 2nd, p. 1239.

Hospital Sunday in London.—June 14th is Hospital Sunday in the metropolis, and it is announced that the Lord Mayor and Sheriffs of London will attend in state the morning service at Westminster Abbey and the afternoon service at St. Paul's Cathedral.

Chelsea Hospital for Women.—Viscount Castlereagh, President of the Hospital, will take the chair on the occasion of the laying of the foundation-stones of the new hospital and nurses' home by the Earl and Countess Cadogan on Tuesday, June 9th, at 3·30 P.M. The Rector of Chelsea, Archdeacon Bevan, will conduct the dedication service.

Donations and Bequests.—By the will of the late Mrs. Ann Smith, of Nottingham, the Nottingham Children's Hospital will receive £1000.—Under the will of the late Mr. Samuel Heilbut the London Hospital, St. Mary's Hospital, the Great Ormond-street Hospital for Children, and the Jews Hospital and Orphan School, Norwood, will receive £1000 each.—An anonymous donor has given £1500 to the Royal London Ophthalmic Hospital for the endowment of a bed and a cot.

Medical News.

University of Cambridge.—The following medical degrees have been conferred:—

M.D.—F. C. Trapnell, King's; F. O. Arnold, Trinity.

University of London.—At examinations held recently the following candidates were successful:—

Third (M.B., B.S.) Examination.

Honours.—*Henry Julyan Hoyte, Westminster Hospital; †Fede Margherita Mackenzie, London (Royal Free Hospital) School of Medicine for Women; and *John Beaufoy Randall, B.Sc., St. Bartholomew's Hospital.

* Distinguished in Medicine. † Distinguished in Midwifery and Diseases of Women.

Pass.—Francis Cooke Alton, St. Thomas's Hospital; Thomas Izod Bennett, Guy's Hospital; Geoffrey Andrew Bird, B.Sc., St. Thomas's Hospital; John Bostock and Michael Joseph Cronin, London Hospital; Hector Wynne Davies, University College Hospital; Robert Ellis, University of Birmingham and St. Bartholomew's Hospital; Henry William Evans, Guy's Hospital; Edward Alex. Marie Joachim Goldie, University College Hospital; Frank Arthur Grange, London Hospital; Peregrine Stephen B. Langton and Oliver Cuff Link, Middlesex Hospital; Robert John McNeill Love, London Hospital; Wilfrid Egerton Milligan, St. Thomas's Hospital; Cresswell Lee Pattison, St. Mary's Hospital; Richard Amyas Preston, London Hospital; Maitland Radford, University College Hospital; Cecil George Richardson, Westminster Hospital; Arthur Montgomery Marsh Roberts, University of Liverpool; Helen Lawson Robertson, London (Royal Free Hospital) School of Medicine for Women; William Henry Price Saunders, Middlesex Hospital; Clive Justin Hicks Sharp, University College Hospital; George William Shore, King's College Hospital; William Simpson, St. Bartholomew's Hospital; John Smith Sloper, St. Thomas's Hospital; Sidney Smith, King's College Hospital; Henry James Drew Smythe, University of Bristol; William Edward Tanner, Guy's Hospital; Victor David Collins Wakeford, St. Bartholomew's Hospital; Aubrey Harrison White, University of Bristol; Alfred Wills, B.Sc., Oscar Reginald Lewis Wilson, and Charles Witts, Guy's Hospital; and Bernard Woodhouse, University College Hospital.

The following candidates have passed in one of the two groups of subjects:—

Group I.—Basil William Armstrong, St. Mary's Hospital; William Claude Percy Barratt, University College Hospital; Robert Maitland Beath, Queen's University, Belfast; Alexander Decimus d'Array, University College Hospital; Una Griffin, Mary Esther Harding, and Mildred Archer Jukes, London (Royal Free Hospital) School of Medicine for Women; John George Owen, B.Sc., King's College Hospital; Cyril Sherris, Guy's Hospital; Godfrey Alan Walker, London Hospital; and Thomas Burges Welch, St. Bartholomew's Hospital.

Group II.—William Roy Blore, Victoria University of Manchester; William Burt, St. Thomas's Hospital; Noel St. John Grey Dudley-Buxton, University College Hospital; John Alfred Wylde Ebden, Westminster Hospital; George Dunluce Eccles, Guy's Hospital; Thomas Percy Lewis, St. Mary's Hospital; Thomas Bond Paul, Middlesex Hospital; Edna Mary Powell, London (Royal Free Hospital) School of Medicine for Women; Arthur Leslie Hanworth Rackham, Middlesex Hospital; Philip Smith, Guy's Hospital; Trevor Richard Snelling, London Hospital; Grace Stapleton, London (Royal Free Hospital) School of Medicine for Women; Joseph Alexander Tsoi-A-Sue, London Hospital; Ernest Haines Walker, St. Thomas's Hospital; and Arthur Graham Winter, London Hospital.

N.B.—This list, published for the convenience of candidates, is issued subject to its approval by the Senate.

Glasgow University Club, London.—Emeritus Professor John Cleland presided at the half-yearly dinner of the Glasgow University Club, London, held in the Trocadéro Restaurant on May 27th. A large proportion of the members are medical graduates. Amongst those present were Director-General Sir Arthur Sloggett, A.M.S., Sir Henry Craik, M.P., Lieutenant-Colonel Sir W. B. Leishman, R.A.M.C., Sir John McCall, Sir Thomas Oliver, Mr. Charles Stonham, Professor W. R. Smith, Principal J. Yule Mackay, Mr. Charles Ryall, Dr. Guthrie Rankin, Dr. Dan McKenzie, Lieutenant-Colonel Legge, Inspector-General of the Australian Forces; Dr. Norris, Commonwealth medical officer in London; and Dr. Alexander Macphail and Dr. D. S. Roxburgh, the honorary secretaries. The Chairman, in proposing "The University of Glasgow," said that his association with it had been long. He had performed the duties of professor of anatomy for 32 years, and at a previous period to that he had been for two years a demonstrator. The latter post he had held under Professor Allan Thomson, a most genial man, who raised the teaching of anatomy in the University to a height which had not been reached in it before. Besides that, he was the first man in this country to teach that very important part of his subject which went by the name of embryology. He was sorry that very few professors who were teaching at the time when he took up the duties of his chair, now remained.

There was only one who still continued at work in his chair, Professor Ferguson, but he was glad that a few others still lived. It was the medical school with which he had most to do, and it had produced many distinguished men in the medical profession. One of those distinguished men was present with them in the person of Sir W. B. Leishman. Sir Henry Craik (the representative of the University in Parliament), in proposing the health of Mr. W. Craig Henderson, who had retired from the office of honorary secretary, congratulated him on the success of his efforts in his professional character as a barrister in saving the University from the attempt to run the Glasgow tramways through its vicinity. Mr. Craig Henderson replied. The Rev. Dr. John Smith responded to the toast of "The Guests," which was proposed by Professor John Adams. Principal Mackay, in submitting the health of the chairman, spoke as an old student of the high ideals which Professor Cleland had set in his teaching. He was the kind of teacher who was looked up to with feelings of admiration, respect, and love by all who had had the privilege of being his students. The toast was drunk with Highland honours.

ROYAL MEDICAL BENEVOLENT FUND.—At the last meeting of the committee 35 cases were considered and grants amounting to £310 voted to 30 of the applicants. The following is a summary of the cases relieved:—

Widow, aged 52, of L.R.C.P. & S. Edin. who practised at Walsall and Bethnal Green. Ill-health and unable to do much work, only earning about 5*s.* per week by nursing. One son, unable to help. Granted £12 in 12 instalments.—Wife, aged 48, of M.R.C.S. Eng. Deserted by her husband. One daughter who with her mother earn a few shillings each week by teaching children. The mother's health very bad. Granted £12 in 12 instalments.—Daughter, aged 57, of M.R.C.S. Eng. who practised in London. Until a few years ago was able to earn her living as housekeeper, but owing to the death of employer and ill-health following through overwork is unable to obtain employment. Granted £12 in 12 instalments.—L.R.C.P. & S. Edin., aged 58, who practised at Leith, suffering from locomotor ataxy and quite unable to work. His wife only a small annuity. Voted £18 in 12 instalments.—Widow, aged 68, of F.R.C.S. Eng. who practised at Putney. Has tried to live by letting off portion of house she rents. Is now suffering from arthritis deformans and quite helpless. Recommended for an annuity. Voted £12 in 12 instalments.—Widow, aged 64, of M.D. Aberd. who practised at Fulham until early this year. Only income £16 per annum. Four children, unable to assist. Voted £12 in 12 instalments.—Widow, aged 49, of L.R.C.P. & S. Edin. who practised in Jamaica. Only certain income 30*s.* per month from another society and friends. Three children unable to assist. Relieved six times, £72. Voted £12 in 12 instalments.—Daughter, aged 62, of L.F.P.S. Glasg. who practised at Widnes. Income £40 per annum from two charities. Suffering from laryngitis. Relieved four times, £20. Voted £5.—Daughter, aged 59, of F.R.C.P. Edin. who practised at Cheadle. Failing health and unable to obtain suitable employment. Allowed £25 per annum by a friend, and earns about £6 10*s.* a year by own efforts. Relieved nine times, £74. Voted £12 in 12 instalments.—Widow, aged 73, of M.R.C.S. Eng. who practised in the Old Kent-road, S.E. Suffering from rheumatoid arthritis. Only income an old age pension. Relieved four times, £40. Voted £12 in 12 instalments.—Widow, aged 43, of L.R.C.P. & S. Edin. who practised in South Wales. Has endeavoured to earn a living for herself and two daughters by nursing, but work has been very uncertain of late. Referred to the Guild. Relieved eight times, £60. Granted £5.—Widow, aged 68, of M.R.C.S. Eng. who practised at Heathfield. Two children, both married, but unable to help. Applicant helpless with rheumatism. Only income £20 per annum. Relieved six times, £63. Granted £12 in 12 instalments.—Widow, aged 51, of L.R.C.P. & S. Edin. who practised at New Quay. Has recently fractured her leg and otherwise been very ill. Two sons who are sailors only able to help slightly. Relieved 12 times, £113. Granted £12 in 12 instalments.—Daughter, aged 75, of M.R.C.S. Eng. who practised at Hackney-road, N.E. Lost all her private income by the failure of her trustee. Only income £52 per annum from friends and relations. Relieved twice, £24. Voted £12 in 12 instalments.—Widow, aged 62, of M.D. Aberd., who served in the I.M.S. Suffers from acute rheumatism. Only income about £28 per annum. Relieved once, £12. Granted £12 in 12 instalments.—Daughters, aged 64 and 67, of F.R.C.S. Eng. who practised at Stokenchurch; both have very indifferent health and quite unable to work. Only joint income about £56 per annum. Relieved twice, £20. Granted £18 in 12 instalments.—Daughter, aged 61, of M.D. Lond. who practised at Goxhill. Suffering from locomotor ataxy. Only income £7 per annum. Relieved five times, £62. Granted £18 in 12 instalments.—Widow, aged 80, of L.R.C.P. & S. Edin. who practised at Skirlaugh. Only income the old age pension. Only son unable to help. Relieved twice, £24. Granted £18 in 12 instalments.—Daughter, aged 86, of M.D. who practised at Manningtree. Receives £13 per annum from another charity. Cause of distress the failure of an annuity of £100. Relieved once, £12. Granted £12 in 12 instalments.—Daughter, aged 59, of L.F.P.S. Glasg. who practised at Mauchline. Health very indifferent. Only income £12 per annum from another charity. Relieved seven times, £80. Granted £10 in two instalments.—Widow, aged 67, of M.R.C.S. Eng. who practised at Pedrham and Jamaica. Three children, none able to help. Health very bad. Only income £26 per annum from friends in Jamaica. Relieved ten times, £65. Granted £10 in two instalments.—Daughter, aged 66, of M.R.C.S. Eng. who practised in India and Bishops Teignton. Earned her own living until six years ago, when she was obliged to give up in consequence of ill-health. Relieved once, £12. Granted £12 in 12 instalments.—Daughter, aged 65, of M.D. Aberd. who practised at London, Ramsgate, and Worthing. Earned her living for 40 years as a teacher of music, but in consequence of ill-health and age unable to continue. Receives an annuity of £21 from another charity. Relieved [illegible] times, £70. Granted £12 in 12 instalments.—Daughters, aged 42 and 50, of L.R.C.S. and L.M. Dub. who practised at Sydenham and [illegible]stead. Elder sister suffering from migraine, the younger one is epileptic. Joint income only £45. The recent death of the mother, who had an annuity of £50, the immediate cause of distress. The cases referred to the Guild for report. Relieved seven times, £75. Granted £5.—Wife, aged 4[illegible], of M.R.C.S. Eng. who practised in Westminster and other places. Deserted by husband. One daughter who earns a little. Applicant, who is lame, has earned a little by teaching English and needlework, but insufficient to support herself. Has an opportunity of purchasing a small teaching connexion. Relieved four times, £[illegible]. Granted £10 in two instalments, the first amount to be utilised in purchasing the teaching connexion.—Widow, aged 53, of M.R.C.S. Eng. who practised at Stockton-on-Tees. Has two children; only help slightly. Earns a little by needlework, but eyesight very bad and getting worse. Relieved ten times, £88. Granted £9 in 12 instalments.—Two other cases were considered and emergency grants of £[illegible] to each were made and the cases referred to the Guild for report.

Contributions may be sent to the honorary treasurer, Dr. Samuel West, 11, Chandos-street, Cavendish-square, London, W.

N.B.—A fee of 5s. is charged for the insertion of Notices of Births, Marriages, and Deaths.

Notes, Short Comments, and Answers to Correspondents.

"TORMENTORS" FOR FLEAS.

IN the late Andrew Tuer's "Old London Street Cries" (1885) there is some discussion as to what could have been the exact meaning of the ancient street-hawker's adjuration—"Buy a tormentor for your fleas," or again, "Buy a fine mousetrap, or a tormentor for your fleas." The latter cry is embalmed in literature in Taylor, the Water Poet's quaint couplet:—

> I could name more, if so my muse did please,
> Of Mouse Traps, and tormentors to kill Fleas.

The bodies of our Elizabethan ancestors, and indeed of Englishmen in general up to the time of the introduction of the morning bath, were more or less tortured by *pulices* and kindred insects. Ingoldsby sings of a big-wig at an early Victorian levee who is troubled by a ravenous flea in the small of his back; the idea was so little shocking to the past generation that the verse was often quoted by admirers of the "Legends."

Irritated thus, the fops of the eighteenth century made use of elegant "scratch-backs," slender rods of ebony or ivory, topped by miniature hands with sharpened fingers. These may have been the descendants of the "*tormentors*" or their sublimation, for the tormentor, hymned by Taylor, was probably a humble affair like a lath, made of some rough substance resembling pumice-stone. Such an instrument was lately preserved in the collection of an Isle of Wight virtuoso, and a specimen may perhaps exist in the London Museum. The scratch-backs with hands are often to be seen in curiosity shops to-day. They were used to get at almost inaccessible parts of the human *economy*, such as the region between the shoulder-blades. Their disappearance is eloquent of the advance of personal hygiene. There are undoubtedly less fleas about than when the Great Plague was supposed to have been spread by the escape of these creatures from sacks of rags in Long Acre.

On the other hand, it might plausibly be argued that our ancestors were conscious that disease is disseminated by fleas or flies, and that the "tormentor" was used in the crusade against them. Hence it may have been in the nature of fly-paper, or even of those little bamboo cages with greased perches which the Japanese are said to take to bed with them in order to catch fleas.

A CASE OF BEE-STING.

To the Editor of THE LANCET.

SIR,—I was attracted by Mr. Lawrence Pick's letter in THE LANCET of May 30th. It is now nearly 13 years ago since I published a similar case in your paper (THE LANCET, Oct. 26th, 1901). Mr. Pick's case and my own are almost identical. The points of interest in the two cases are: (1) The extreme rapidity of onset of symptoms after the individual had been stung; (2) the general skin eruption, with its intense irritability; (3) vomiting; and (4) the rapid disappearance of the rash. The points of difference in the two cases were: (*a*) Whereas in Mr. Pick's case it was a bee-sting, in mine it was the sting of a wasp; and (*b*) the rash is described in his case as being "scarlatiniform," while in mine it was urticarial. Mr. Pick asks for a cause. He may be interested to hear the suggestion I offered in THE LANCET at that time—"the suddenness of the onset of the rash after the sting seems to be indicative of a hypodermic injection of some toxic substance which might have been imparted with the sting." I am, Sir, yours faithfully,

T. WILSON PARRY.

Crouch End Hill, N., May 29th, 1914.

REINDEER MEAT.

A CORRESPONDENT writes: Dr. W. T. Grenfell, the well-known medical missionary and explorer of Labrador, is about to start reindeer farms in Labrador to meet the demand for reindeer meat in Canada, and it is also proposed to bring some of the frozen reindeer meat to England. The caribou, or renne du Canada, otherwise cariboo, is the name of the North American reindeer. It is the fleetest, wildest, and most shy of all the deer tribe. The woodland cariboo is abundant in Labrador, and may be found in considerable numbers in New Brunswick and in parts of Nova Scotia. The reindeer moss, otherwise called cariboo moss (Cladonia or Cenomyce rangiferina), is the principal food of the reindeer in the sterile regions, and covers the rocks. Professor Henry Youle Hind, who wrote "Explorations in the Interior of the Labrador Peninsula," published in London in 1863, said that "Once the country was rich in fur-bearing animals and cariboo or reindeer, but these are now greatly reduced in numbers." Nansen, speaking of the Eskimos, said: "One of their greatest delicacies is the contents of a reindeer's stomach. If a Greenlander kills a reindeer and is unable to convey much of it home, he will, I believe, secure the stomach first of all. It is, no doubt, because they stand in need of vegetable food that they prize this so highly, and also because it is in reality a very choice collection of the very finest moss and grasses which that 'gourmet,' the reindeer, picks out for himself. It has undergone a sort of stewing in the process of semi-digestion, while the gastric juice provides a somewhat sharp and aromatic sauce."

A NEW BINOCULAR MICROSCOPE.

IN reviewing the exhibits of medical interest at the Royal Society conversazione in an article in our issue of May 23rd we inadvertently omitted to mention that the new binocular microscope of Mr. E. Leitz (18, Bloomsbury-square, London, W.C.) was seen to great advantage in the demonstration of microscopic objects. This instrument is capable of being used for all purposes to which the monocular microscope is put, and without at all impairing the performance of any optical system. In a paper read before the Royal Microscopical Society this microscope is described as the first successful binocular instrument made for use with all ordinary objectives and eyepieces, including the highest powers. This, of course, is a most important achievement which adds considerably to the value of the microscope in the work of biological diagnosis. The body of the binocular microscope consists of a flat casing containing the system of prisms. At the upper end are situated two eyepieces whose distance apart can be regulated to suit the eyes of the observer by means of a milled head which actuates two levers inside the casing. The interpupillary distance can be varied between 54 and 70 mm. The eyepiece tubes slide in guides so that dust cannot enter the prism casing. The left eyepiece tube is provided with an independent adjustment to accommodate eyes of unequal vision. All kinds of eyepieces and objectives may be used, and the instrument can be employed for the same purposes as the ordinary monocular microscope. A most important feature in this microscope is the parallel eyepieces which obviate the actions of accommodation and adjustment for convergence as is necessary in binocular microscopes constructed hitherto. By the use of this instrument it is now possible for the research worker to employ both eyes in microscopical observations for a considerably longer period with much less fatigue than is commonly felt by using one eye in high magnifications. Greater facilities are thus offered in future researches and the prolonged routine of daily microscope work may be carried on with much less eye-strain.

THE STERILISATION OF MILK AND ALLIED QUESTIONS.

To the Editor of THE LANCET.

SIR,—In THE LANCET of Feb. 14th last you published a letter from Mr. Richard W. Woosnam on the subject of condensed milk, in which he offered to arrange for an inspection of a condensed milk factory by any medical men interested in the matter. I wrote to Mr. Woosnam, and he very kindly arranged with the Anglo-Swiss Condensed Milk Co. for a small party of medical men to inspect their factory at Aylesbury. I went with them, and full opportunities were given us to inspect the factory and the whole of the process of condensation. The arrangements to ensure absolute cleanliness and the details of the process employed in condensing and sweetening the milk are most interesting. Mr. Simond, the manager, tells me that the company make arrangements for conducting parties of medical men over the works at frequent intervals, and that any doctor who applies to the company for permission to visit the works will receive an invitation to join the next party. The visit takes the greater part of the day, but the provision made by the company is such as to make it a very enjoyable as well as instructive outing.—I am, Sir, yours faithfully,

C. THACKRAY PARSONS, M.D. Lond.

Fulham Infirmary, Hammersmith, W., May 29th, 1914.

THE UROBILIN REACTION IN BLACKWATER FEVER.

DR. Sörensen, of the Dutch Army in Flores, a small island in the most beautiful part of the Sunda Seas, reports in the *Archiv für Schiffs- und Tropen-Hygiene* for March an interesting observation on the urobilin reaction in malaria and blackwater fever. He made his tests either by Schlesinger's zinc acetate method or by the spectroscope, and even devised a quantitative method by dilution of the urine till the absorption bands were no longer visible. There is much malaria in Flores. In all cases of the three forms of malaria there was a reaction during pyrexia, and urobilin disappeared from the urine two to three days after defervescence. It reappeared again in some cases before relapses, and daily increased till the fever developed. Other relapses might show no warning urobilin. The more urobilin appeared, the worse the patient felt, the more anæmic he became, and the longer his convalescence lasted. One day a patient gave a value of 125; this was astonishing, and only to be explained by great destruction of red blood corpuscles and the oncoming of hæmoglobinuria. He had had 15 gr. quinine on each of the preceding days, was very slightly jaundiced, but had albuminuria. His quinine was stopped and he was put in hospital; that night he had hæmoglobinuria which increased till next midday, and lasted in all 40 hours. Urobilin disappeared from the urine in about a week, and in 10 days the patient applied to leave the hospital to get married. Very similar experiences are related concerning 15 other cases of blackwater fever. They were all recognised 12 to 24 hours before hæmoglobinuria set in.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

Medical Diary for the ensuing Week.

SOCIETIES.

ROYAL SOCIETY, Burlington House, London, W.

THURSDAY.—4.30 P.M., Croonian Lecture:—Prof. E. B. Wilson (Columbia University): The Bearing of Cytological Research on Heredity.

ROYAL SOCIETY OF MEDICINE, 1, Wimpole-street, W.

TUESDAY.

SECTION OF SURGERY (Hon. Secretaries—J. Murray, Raymond Johnson).

MEETING AT LIVERPOOL, the arrangements for which have already been announced. Members intending to attend the meeting are requested to send their names to one of the Hon. Secretaries without delay.

WEDNESDAY.

SECTION OF OPHTHALMOLOGY (Hon. Secretaries—J. Herbert Parsons, Leslie Paton).

Annual General Meeting.—Election of Officers and Council for Session 1914–1915.

Cases (at 8 P.M.):

Mr. Harold Whale (introduced by Mr. Brewerton): Case of West's Intranasal Operation for Dacryocystitis (photograph and instruments).

Mr. R. Affleck Greeves: Supernumerary Punctum Lacrimale and Canaliculus.

Mr. Rayner and Dr. Batten: Double Detachment of the Retina in a Boy with Functional Albuminuria.

Mr. E. Erskine Henderson: Hole in Optic Disc (drawing).

Mr. Charles Wray: (1) Multiple Ruptures of Choroid between Macula and Disc, with V. = $\frac{6}{6}$ (drawing); (2) Keratoconus treated by Snell's Cautery.

Papers (at 8.30 P.M.):

Mr. Charles Wray: Operative Treatment of Keratoconus.

Mr. E. Erskine Henderson: Rupture of Optic Nerve at Lamina *Cribrosa*.

THURSDAY.

SECTION OF OBSTETRICS AND GYNÆCOLOGY (Hon. Secretaries—T. Watts Eden, C. Hubert *Roberts): at 8 P.M.*

Specimens:

Dr. Macnaughton-Jones: Twin Female Monster.

Mr. Gordon Luker: A Lithopædion Removed *from* a Patient Six Months Pregnant.

Epidiascope Demonstration:

Professor David Waterston: A Decidual Cast containing a Very Young Embryo.

Papers:

Dr. Archibald Donald (Manchester): Case of So-called Chronic *Metritis in a Nullipara.*

Dr. W. Fletcher Shaw (Manchester): The Subdivisions of Chronic Metritis.

MEDICAL SOCIETY OF LONDON, 11, Chandos-street, Cavendish-square, W.

TUESDAY AND THURSDAY.—9 P.M., Lettsomian Lectures:—Dr. F. M. Sandwith: Dysentery. (Lecture II. will be illustrated by pictures and pathological specimens.)

SOUTH-WEST LONDON MEDICAL SOCIETY, Bolingbroke Hospital, Wandsworth Common, S.W.

WEDNESDAY—9 P.M, Bolingbroke Lecture:—Dr. W. Hale White.

LECTURES, ADDRESSES, DEMONSTRATIONS, &c.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC, 22, Chenies-street, W.C.

MONDAY.—4 P.M., Dr. A. M. H. Gray: Clinique (Skin). 5.15 P.M Lecture:—Dr. F. L. Golla: Acute Anterior Poliomyelitis.

TUESDAY.—4 *P.M., Dr. P. Parkinson:* Clinique (Medical). 5.15 P.M., Lecture:—Mr. A. E. J. Barker: Leucoplakia on the Tongue and Other Parts.

WEDNESDAY.—4 P.M., Mr. J. Berry: Clinique (Surgical) 5.15 P.M., Lecture:—Dr. J. C. McClure: Neurasthenia Gastrica.

THURSDAY.—4 P.M., Dr. F. G. Crookshank: Clinique (Medical). 5.15 P.M., Lecture:—Dr. J. F. H. Dally: Practical Electrocardiography.

FRIDAY.—4 P.M., Mr. W. Stuart-Low Clinique (Ear, Nose, and Throat).

POST-GRADUATE COLLEGE, West London Hospital, Hammersmith-road, W.

MONDAY.—10 A.M., *Dr.* Simson: Diseases of Women. 10.30 A.M., Medical Registrar: *Demonstration* of Cases in Wards. 12 noon, Dr. Bernstein: Pathological Demonstration. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. D. Armour: Operations. Dr. Pritchard: Bacterial Therapy Department. Mr. B. Harman: *Diseases* of the Eye. 5 P.M., Lecture:—Dr. Saunders: Diseases *of the Liver.*

TUESDAY.—10 A.M., Dr. Robinson: Gynæcological Operations. Dr. Owen: Demonstration of Cases in Wards. 12 noon, Mr. T. Gray: Demonstration of Fractures, &c. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. *Baldwin:* Operations. Dr. Davis: Diseases of the Throat, Nose, and Ear. Dr. Pernet: Diseases of the Skin. 5 P.M., Lecture:—Dr. Saunders: Diseases of the Liver.

WEDNESDAY.—10 A.M., Dr. Saunders: Diseases of Children. Dr. Davis: Operations of the Throat, Nose, and Ear. 11 A.M., Mr. Souttar: Demonstration of Minor Operations. 12 noon, Lecture:—Mr. Souttar: Abdominal Diagnosis. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Pardoe: Operations. Dr. Simson: Diseases of Women. Mr. Gibb: Diseases of the Eye. 5 P.M., Lecture:—Dr. Saunders: *Diseases of the Liver.*

THURSDAY.—9 A.M., Dr. Bernstein: Bacterial Therapy Department. 10 A.M., Dr. Simson: Gynæcological Demonstration. 12 noon, Lecture:—Dr. G. Stewart: Neurological Cases. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. D. Armour: Operations. Mr. B. Harman: Diseases of the Eye. 5 P.M., *Lecture:*—Dr. Saunders: Diseases of the Liver.

FRIDAY.—10 A.M., *Dr. Robinson: Gynæcological* Operations. 10.30 A.M., Surgical Registrar: Demonstration of Cases in Wards. 12.15 P.M., Lecture:—Dr. Bernstein: Applied Pathology. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Baldwin: Operations. Dr. Davis: Diseases of the Throat, Nose, and Ear. Dr. Pernet: Diseases of the Skin. 5 P.M., Lecture:—Dr. Saunders: Diseases of the Liver.

SATURDAY.—10 A.M., Dr. Saunders: Diseases of Children. Dr. Davis: *Operations of the Throat, Nose, and* Ear. Mr. Gibb: Diseases of the Eye. 12 noon, Lecture:—Mr. *Souttar:* Surgical Anatomy of the Abdomen. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Pardoe: Operations.

LONDON SCHOOL OF CLINICAL MEDICINE, *Dreadnought* Hospital, Greenwich.

MONDAY.—Out-patient Demonstrations:—10 A.M. Dr. H. *B.* Carlill: Medical. Mr. H. Curtis: Surgical. 12 noon, Mr. G. N. Biggs: Throat, Nose, and Ear.—2.15 P.M., Mr. *W. Turner: Surgery.* 3 *P.M., Mr. W. Turner: Operations.* 3.15 *P.M.,* Sir Dyce Duckworth: Medicine. 4.15 P.M., Mr. R. Lake: Throat, Nose, and Ear. 3.15 P.M., Special Lecture:—Sir Dyce Duckworth: Prognosis in Cases of Albuminuria.

TUESDAY.—Out-patient Demonstrations:—10 A.M., Dr. *C. E. Zundel:* Medical. Mr. Cole: Surgical. 12 noon, Dr. H. MacCormac: Skin.—2 P.M., Mr. L. McGavin: Operations. 2.15 P.M., Mr. *R. Carling: Surgery.* 3.15 P.M., Dr. G. Rankin: Medicine. 4.15 P.M., Sir Malcolm Morris: Skin. 3.15 *P.M., Special* Lecture:—Dr. G. Rankin: Lymphadenoma.

WEDNESDAY.—Out-patient Demonstrations: *10 A.M., Dr.* H. B. Carlill: Medical. Mr. Cecil Rowntree: Surgical. 11 A.M., Mr. R. E. Bickerton: Eye.—2 P.M., Mr. L. V. Cargill or Mr. Choyce: Operations. 2.15 P.M., Dr. F. Taylor: *Medicine.* 3.15 P.M., *Mr. Cargill: Eye Clinique.* 4.30 P.M., Mr. C. C. Choyce: Surgery. 3.15 P.M., Special *Lecture:*—Mr. L. V. Cargill: Syphilitic Affections of the Eye and its Adnexa.

THURSDAY.—Out-patient Demonstrations:—10 A.M., Dr. H. R. Prentice: Medical. Mr. H. Curtis: Surgical. *12 noon,* Mr. G. N. Biggs: Throat, Nose, and Ear.—2 P.M., Mr. R. *Carling or* Mr. W. Turner: Operations. Dr. A. Davies: *Pathological* Demonstration. 3.15 P.M., Dr. R. Wells: Medicine. 4.30 P.M., Special Lecture:—Mr. C. Rowntree: Cancer of the *Tongue.*

FRIDAY.—Out-patient Demonstrations:—10 A.M., *Dr. C. E. Zundel:* Medical. Mr. Cole: Surgical. 12 noon, *Dr. H.* MacCormac: Skin.—2 P.M., Mr. L. McGavin: *Operations.* 2.15 P.M., Sir John Rose Bradford: Medicine. 3.15 P.M., Mr. L. McGavin: Surgery.

SATURDAY.—Out-patient Demonstrations: 10 A.M., Dr. H. R. Prentice: Medical. Mr. Cecil Rowntree: Surgical. 11 A.M., Mr. R. E. Bickerton: *Eye.*—10 A.M., *Col. Barry:* Radiography.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of *Wales's General Hospital, Tottenham, N.*

MONDAY.—Clinics:—10.30 A.M., Surgical *Out-patient* (Mr. E. Gillespie). 2.30 P.M., Medical Out-patient (*Dr. T. R. Whipham*); Gynæcological (Dr. *Banister*). 3 P.M., Medical In-patients (Dr. R. M. Leslie).

TUESDAY.—2.30 P.M., Operations. *Clinics:*—Medical Out-patient (Dr. A. G. Auld); Surgical (Mr. *Howell* Evans); Nose, Throat, and Ear (Mr. H. *D. Gillies*). X Ray and Electrical Methods (Dr. Metcalfe). 3.30 P.M., Medical In-patient (Dr. A. J. Whiting).

WEDNESDAY.—Clinics:—2 P.M., Throat Operations (Mr. Gillies). 2.30 P.M., Children's Out-patient (*Dr.* T. R. Whipham); Skin (Dr. G. N. Meachen); Eye (Mr. *Dorell*).

THURSDAY.—2.30 P.M., Gynæcological Operations (Dr. A. B. Gillespie). *Clinics:*—Medical Out-patient (*Dr. A.* J. Whiting); Surgical (Mr. Carson); X Rays and Electrical *Methods (Dr. Metcalfe).*

FRIDAY.—2.30 P.M., Operations. *Clinics:*—Medical Out-patient (Dr. A. G. Auld); Surgical (Mr. E. Gillespie); Eye (Mr. R. P. Brooks). 3 P.M., Medical In-patient (Dr. *G.* P. Chappel).

ROYAL HOSPITAL FOR *DISEASES* OF THE CHEST, Medical School, City-road, E.C.

MONDAY.—1.30 P.M., Department *for* the Prevention of Consumption. 2 P.M., Cardiac Department, Dr. Stott; *Out-patient* Department, Dr. Phear, Dr. S. Thompson. 3 P.M., Wards, Dr. Phear.

TUESDAY.—9 A.M., Laryngological Department, Mr. Mant. 1.30 P.M., Department for the *Prevention* of Consumption. 2 P.M., Out-patient Department, Dr. M. Leslie, Dr. B. King; Operations, Mr. A. Evans. 3 P.M., Wards, Dr. White. 4 P.M., Wards, Dr. M. Leslie.

WEDNESDAY.—2 P.M., Wards, Dr. A. Davies; Out-patient Department, Dr. Drysdale, Dr. Kellie. 4 P.M., Wards, Dr. Drysdale. 4.30 P.M., Roentgen Ray Department, Dr. Jordan.
THURSDAY.—9.30 A.M., Dental Department, Mr. G. Thomson. 10 A.M., Cardiac Department, Dr. Stott. 1.30 P.M., Department for the Prevention of Consumption. 2 P.M., Out-patient Department, Dr. Phear, Dr. S. Thompson. 4.30 P.M. Laryngological Department, Mr. Mant.
FRIDAY.—1.30 P.M., Department for the Prevention of Consumption. 2 P.M., Wards, Dr. Calvert; Out-patient Department, Dr. M. Leslie, Dr. B. King. 5 P.M., Lecture-Demonstration:—Dr. B. King: Bronchitis, Emphysema, Pneumonia and Pleurisy in Relation to Pulmonary Tuberculosis.
SATURDAY.—10 A.M., Out-patient Department, Dr. Drysdale, Dr. Kellie. 11.30 A.M., Roentgen Ray Department, Dr. Jordan.

LONDON HOSPITAL MEDICAL COLLEGE (UNIVERSITY OF LONDON), Clinical Theatre, London Hospital, Mile End-road, E.

Course of Lectures on Tuberculosis for Post-Graduates and Senior Students:—
MONDAY.—4 P.M., Dr. W. J. Hadley: General Treatment (I.).
TUESDAY.—4 P.M., Dr. H. R. Andrews: Tuberculosis of Genital Organs in the Female.
WEDNESDAY.—4 P.M., Dr. W. J. Hadley: General Treatment (II.).
THURSDAY.—4 P.M., Dr. C. Wall: Specific Treatment.

GUY'S HOSPITAL MEDICAL SCHOOL, London Bridge, S.E.

Course of Lectures on Industrial Medicine:—
FRIDAY.—4 P.M., Lecture VI.:—Dr. F. Shufflebotham: The Medical Aspect of the Workmen's Compensation Act.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton, S.W.

WEDNESDAY.—4.30 P.M., Lecture:—Dr. Meek: Some Aspects of Sanatorium Treatment.

CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, Victoria Park, E.

Course of Demonstrations for Post-Graduates:—
FRIDAY.—4 P.M., Dr. C. Riviere: Collapse Therapy (Artificial Pneumothorax).

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen-square, Bloomsbury, W.C.

TUESDAY.—3.30 P.M., Clinical Lecture:—Dr. J. Collier: Craft Palsy.
FRIDAY.—3.30 P.M., Lecture:—Dr. H. Tooth: Clinical Cases.

THE THROAT HOSPITAL, Golden-square, W.

MONDAY.—5.15 P.M., Special Demonstration of Selected Cases.
THURSDAY.—5.15 P.M., Clinical Lecture.

LONDON LOCK HOSPITAL, 91, Dean-street, Soho, W.

Special Course of Instruction in Venereal Diseases, for Post-Graduates and Students, with Practical Demonstrations of the Various Methods of Treatment:—
MONDAY.—Clinics:—1 P.M., Mr. Ryall; 6 P.M., Mr. Gibbs.
TUESDAY.—Clinics:—2 P.M., Mr. Lane; 6 P.M., Mr. Paterson.
WEDNESDAY.—Clinic:—6 P.M., Mr. Shillitoe.
THURSDAY.—2 P.M., Lecture:—Mr. Lane: Gonorrhœal Arthritis and its Treatment.
SATURDAY.—Clinic:—2 P.M., Mr. McDonagh.

MANCHESTER HOSPITALS POST-GRADUATE CLINICS.

THURSDAY.—ANCOATS HOSPITAL—4.30 P.M., Mr. H. Platt: The Surgical Treatment of Infantile Paralysis.

For further particulars of the above Lectures, &c., see Advertisement Pages.

A DIARY OF CONGRESSES.

WE shall publish this diary from time to time that our readers may have under their hands the dates of the approaching scientific Congresses. It is unnecessary to issue the lists of all these functions week by week, and we propose to make only such gatherings as will occur in the immediate future the subject of regular announcement. The following Congresses, Conferences, and Exhibitions are announced:—

May 1st-Nov. 1st (Lyons).—International Town Hygiene Exhibition.
„ 15th-Oct. 15th (Berne).—Swiss National Exhibition.
May-October (London, Shepherd's Bush).—Anglo-American Exposition.
June 8th-10th (Berne).—Seventh International Dairy Congress.
„ 9th-12th (Birmingham).—National Council of Nurses' Annual Conference and Nursing Exhibition.
„ 15th-18th (Portsmouth).—International Abolitionist Conference (Prostitution).
„ 18th-20th (Newcastle-upon-Tyne).—Fifth Annual Conference of the British Hospitals Association.
„ 19th-24th (London, Church House, Westminster).—International Conference on the Blind.
June-July (Groningen).—University of Groningen 300th Anniversary Celebration.

EDITORIAL NOTICES.

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITOR," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention should be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this office.

Lectures, original articles, and reports should be written on one side of the paper only, AND WHEN ACCOMPANIED BY BLOCKS IT IS REQUESTED THAT THE NAME OF THE AUTHOR, AND IF POSSIBLE OF THE ARTICLE, SHOULD BE WRITTEN ON THE BLOCKS TO FACILITATE IDENTIFICATION

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers—not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale, and advertising departments of THE LANCET *should be addressed "To the Manager."*

We cannot undertake to return MSS. not used.

MANAGER'S NOTICES.

TO SUBSCRIBERS.

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423, Strand, London, W.C., are dealt with by them? Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and *not* to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will ensure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

THE COLONIAL AND FOREIGN EDITION (printed on thin paper) is published in time to catch the weekly Friday mails to all parts of the world.

The rates of subscriptions, post free from THE LANCET Offices, have been reduced, and are now as follows:—

FOR THE UNITED KINGDOM.		TO THE COLONIES AND ABROAD.	
One Year	£1 1 0	One Year	£1 5 0
Six Months	0 12 6	Six Months	0 14 0
Three Months	0 6 6	Three Months	0 7 0

(The rate for the United Kingdom will apply also to Medical Subordinates in India whose rates of pay, including allowances, is less than Rs.50 per month.)

Subscriptions (which may commence at any time) are payable in advance. Cheques and Post Office Orders (crossed "London County and Westminster Bank, Covent Garden Branch") should be made payable to the Manager, Mr. CHARLES GOOD, THE LANCET Offices, 423, Strand, London, W.C.

TO COLONIAL AND FOREIGN SUBSCRIBERS.

SUBSCRIBERS ABROAD ARE PARTICULARLY REQUESTED TO NOTE THE RATES OF SUBSCRIPTIONS GIVEN ABOVE.

The Manager will be pleased to forward copies direct from the Offices to places abroad at the above rates, whatever be the weight of any of the copies so supplied.

SOLE AGENTS FOR AMERICA—MESSRS. WILLIAM WOOD AND CO., 51, Fifth Avenue, New York, U.S.A.

METEOROLOGICAL READINGS.

(Taken daily at 8.30 a.m. by Steward's Instruments.)

The Oliver-Sharpey Lectures
ON
SOME EFFECTS WHICH FOLLOW UPON CHANGES IN THE REACTION OF THE BLOOD.

Delivered before the Royal College of Physicians of London on March 31st and April 2nd, 1914,

By F. GOWLAND HOPKINS, M.A. CANTAB., M.B., D.Sc. LOND., F.R.C.P. LOND., F.R.S.,
READER IN CHEMICAL PHYSIOLOGY IN THE UNIVERSITY OF CAMBRIDGE.

LECTURE II.[1]

Delivered on April 2nd.

MR. PRESIDENT AND GENTLEMEN,—At the close of my first lecture I pointed out that a change of reaction in the blood may be responsible for the increase of metabolism in fever. This leads me to say a few words concerning the effects upon metabolism which are observed after experimental interference with the reaction.

METABOLISM AND BLOOD REACTION.

Bearing on the effects of administering acids and alkalies to man, there is, of course, a large literature, dating from many years back. It is a somewhat tangled literature, but one may safely say, I think, that, taking the evidence as a whole, we have a genuine basis for the belief that the administration of alkali increases, while giving acids diminishes, the oxidative processes of metabolism. I will turn for a moment to experiments done upon animals in this connexion. An old observation made by Lehmann seemed to show that in rabbits there was a definite decrease of oxygen consumption when acids were injected into the circulation, and an increase as the result of injecting alkalies. Recent experiments carried out by Szili[2] have proved that injections of acids in the quantities so employed definitely increase the hydrogen ion concentration in the blood, though it may still react alkaline to lacmoid. Experiments similar to those of Lehmann, published during the present year by Leimdörfer,[3] show plainly enough a fall in oxygen consumption after the injection of acids, but this observer claims to have obtained in some experiments a fall in the case of alkalies also, though his protocols show a number of cases in which there was a marked rise. So far, however, as such experiments are of any value, more weight should be attached to the results of acid administration than to the effects of alkali. In the case of the former, the depression of metabolism is seen in spite of increased activity in the respiratory muscles. Moreover, as we have learned, a rise in hydrogen ion concentration, because of its effect upon oxyhæmoglobin, tends to increase the rapidity of the oxygen supply to the tissues. Any secondary effects due to the acid would therefore tend to limit rather than increase its direct effect upon metabolism. With alkalies, on the other hand, we have to reckon with the pleionexy which must result from their injection. This might interfere with the supply of oxygen to the tissues and obscure the direct influence of the alkali. The effect upon the dissociation curve of hæmoglobin has indeed to be remembered in the interpretation of the results of all such experiments.

More satisfactory are observations upon the results of administering acids and alkalies by the mouth. Almost the only research of importance on these lines is that of Chvostek[4] (1893), in which rabbits received 0·9 gramme of hydrochloric acid per kg. of body weight, administered by the mouth in two or three portions during 24 hours. As measured either by the oxygen consumption or by heat production there was an extremely well-marked depression in metabolism, amounting in the case of two of the animals to 31 and 49 per cent. respectively.

Carbohydrate Metabolism.

Evidence for the lessening of metabolic processes as the result of increase of acidity comes to light very clearly in the interesting observations of Rona and Willenko[5] upon the isolated perfused heart. The experiments show that the utilisation of sugar by the heart is depressed by rise of acidity in the circulating medium. An alteration in the hydrogen ion concentration leading to a comparatively small departure from the normal reaction of the blood on the side of acidity prevents altogether the utilisation of the sugar supplied to the organ. These experiments are especially interesting in that the actual ionic acidity was measured and controlled, while the effect of varying it could be observed apart from all complicating factors. The experiments do not, of course, show at what stage in the course of sugar utilisation the inhibition occurs. It may be that a process which necessarily precedes oxidation is interfered with, rather than the oxidation process itself; the formation of glycogen, for instance, or some other synthetic process. The raising of this point suggests reference to another line of inquiry which has occupied a number of observers—I mean the question as to how far a change of reaction in the body fluids affects the stability of its carbohydrate stores. It is a question which from the first greatly interested Pavy, and his interest in it remained to the end of his life. In his book upon diabetes, published so far back as 1869, he describes experiments of his own bearing upon the matter, and he was engaged upon similar ones during the year in which he died. He, in conjunction with Bywaters, had shown that alkalies inhibit while acids accelerate the post-mortem destruction of glycogen in the liver, and in 1911, quite shortly before his death, he demonstrated to the Physiological Society the fact that the glycosuria induced in cats by chloroforming was arrested by carefully conducted intravenous injection of sodium carbonate. Dr. Pavy more than once talked with me concerning this phenomenon, and I know that he believed to the last that it was of real importance in connexion with diabetes.

Külz, so far back as 1881, observed glycosuria after injecting phosphoric acid intravenously into rabbits, and many experiments of like kind with similar results are described in the literature. It is clear that such experiments alone do not enable us to judge how the acid and alkali act; whether by respectively mobilising or stabilising the glycogen stores or by affecting the oxidative powers of the tissues. In all such observations we have, moreover, to think of a possible intrusion of the suprarenal function. But Macleod,[6] like Pavy, finds that a very small increase of acidity accelerates glycogenolysis. There is no doubt that the optimum action of the liver diastase occurs slightly on the acid side of neutrality, and little doubt that a small change in H ion concentration greatly affects the stability of the glycogen in the liver cell. Elias[7] has quite recently published an account of a fresh study of the relation between acid intoxication and glycosuria. He found, in what seem to have been carefully controlled experiments, that giving comparatively small amounts of hydrochloric acid by the mouth greatly reduced the percentage of glycogen in the liver of normal rabbits. Hyperglycæmia and glycosuria were also observed. Even dogs, which are so much less sensitive to the effects of acid, became under similar treatment hyperglycæmic and glycosuric. Elias brings forward evidence to show that the suprarenal gland was in no way responsible for these results. When the isolated livers of turtles were perfused with sugar solution containing N/200 hydrochloric acid there was rapid loss of glycogen from the liver, while, conversely, there was definite glycogen formation in the organ as a result of perfusing it with a sugar solution made slightly alkaline.

Elias and Kolb[8] have further demonstrated an effect of a change of blood reaction upon carbohydrate metabolism in a condition which, though special and not displayed by man, is instructive. In the year 1890 Hofmeister pointed out that young dogs after temporary starvation exhibit a greatly diminished tolerance for sugar. It is shown by the above authors that the condition is due to the diminished alkalinity of the blood. Unfortunately they relied upon titration figures for their estimations, but, as they point out, Rolly has shown by direct measurement that starvation in dogs appreciably raises the H ion concentration. The glycosuria which results upon giving sugar may be wholly prevented by the simultaneous administration of alkali. This effect of starvation is certainly not due to any stimulation of the suprarenals. It occurs after the sympathetic nerves have been cut.

The recent experiments of Merlin and Kramer[9] have apparently a similar bearing. If acids be administered to a depancreatised dog the sugar excretion displays a sharp rise, while a dose of alkali promptly diminishes the output.

Taking all these facts into consideration, it seemed not impossible that comparatively small doses of acid taken by the mouth might to some degree affect the amount of sugar in the blood of a normal individual. Cole has tested this point on several occasions by taking himself doses equal to 1 gramme of pure hydrochloric acid, but he found no measurable effect. Evidence depending upon the use of such small doses is, of course, of no value as against the view that change of reaction in the liver or of the hepatic blood can mobilise glycogen; but it is interesting to note that they seem sufficient to produce a measurable lowering of the alveolar CO_2 tension and to affect the dissociation curve of oxyhæmoglobin. Barcroft found this, at any rate, on the one occasion on which Cole's blood was tested. This was two hours after a gramme dose of HCl. There was, of course, no meionexy, but the curve was found to be shifted when points were determined in the presence of a normal instead of the lowered tension of CO_2, so that the addition of acid to the blood could be demonstrated.

That mobilisation of glycogen by increase of acidity may play a part in a kind of automatic regulation of the blood sugar—a low concentration of sugar leading to acid production in the liver, and this in turn yielding more sugar to the blood—is a doubtful if tempting hypothesis. But we must certainly not forget that local changes of reaction may be of importance in connexion with sugar mobilisation; nor, indeed, that such local changes may be significant in much wider connexions.

METABOLIC FACTORS IN CONTROL OF BLOOD REACTION.

I propose to deal with such local changes after saying first a few words on a more general point. I may speak of the tissues without departing from my theme. The reaction of the blood cannot, of course, be really considered apart from the reaction of the tissues. Adjustment of reaction in the blood is only an aspect of adjustment throughout the body. We have to recognise that in the tissues local changes of reaction may occur, of a temporary or, under abnormal conditions, of a more permanent character.

When in my previous lecture I dealt with the control of blood reaction I was concerned with only one side of the subject. The physico-chemical and secretory factors which so rapidly adjust the blood reaction to a mean value are continuously called into action by the vagaries of metabolism; but metabolic factors also play their part in the adjustment itself. We think at once of the familiar reaction of the body whereby ammonia is produced to meet a relative deficiency of bases. Now this supply of ammonia would seem to call for changes in metabolism much more deep-seated than those hitherto pictured as requisite. We have been inclined to attribute the existence of ammonia in the urine during various conditions of acidosis as due merely to a partial arrest in the process of the conversion of ammonium salts into urea. But McCollum and Hoagland[10] have carried out experiments in which pigs were kept on a dietary consisting only of starch mixed with either acid, neutral, or basic salts, or, in other cases, mixed with free mineral acids. The nitrogenous metabolism was, therefore, wholly endogenous. Quantitative comparison showed that the extra ammonia excreted on the acid dietaries was not part of that which, in the absence of acids, becomes urea, but represented added nitrogen drawn from the tissues. As the authors point out, their results recall the equilibrium theory which Schryver[11] put forward eight years ago. Schryver had himself previously shown that acids accelerate the action of autolytic ferments. Now the amino-acids liberated by these enzymes are the source of the ammonia which serves for the neutralisation of acids. With a normal food-supply neutralisation is secured by the presence of fixed bases in the diet, aided, if necessary, by ammonia derived from the amino-acids of the food. But consider what occurs in starvation. Here we get acidosis owing to the absence of carbohydrates, and no extraneous supply of bases or of amino-acids to yield ammonia. Tissue acidity (or decrease of tissue alkalinity) results; the action of the autolytic ferments is therefore accelerated, and the production of ammonia from the liberated amino-acids is accurately adjusted to meet the requirements of neutralisation. The process of autolysis is thereby checked, and adjustment becomes automatic. This, very partially and dogmatically stated, is Schryver's theory. It is certainly supported by McCollum and Hoagland's experiments, in which the place of the endogenous acidosis due to starvation is taken by the acid added to the diet. In essence, and within the limits quoted, Schryver's view can, I think, hardly fail to be true. I think, too, that the phenomena upon which it is based explain, partially at any rate, the necessity of carbohydrate for protein equilibrium, and very likely bear upon experiments which seem to show that ammonium salts can act as protein sparers.

---

[7] Biochemische Zeitschrift, 48, 120.

[8] Ibid., 52, 331.

[9] Journal of Biological Chemistry, vol. xv., p. 365.

[10] Journal of Biological Chemistry, vol. xvi., 1913, p. 299.

[11] Biochemical Journal, vol. i., 1906, p. 123.

In parenthesis I would point out that McCollum and Hoagland's experiments, and incidentally the theoretical views of Schryver, bear also upon the question I have just discussed, the effects, namely, of acids and alkalies upon the total grade of metabolism. The former we have seen depress, while the latter increase, oxidative processes. The reverse is the case with respect to the excretion of nitrogen. McCollum and Hoagland got the lowest possible endogenous nitrogen excretion when alkalies were added to the starch ration, and the highest when acids were added. This is merely further proof of facts with which we are familiar. The excretion of nitrogen is dissociated from the main oxidation of metabolism. The elimination of the nitrogen from the free amino-acids of protein proceeds promptly and independently, even when the main supply of energy contained in these amino bodies is not being liberated but stored up. We have just seen that mineral acids, because they liberate the amino-acids, increase the nitrogen output, even though they depress metabolism as a whole. With alkalies the phenomena are reversed.

RELATION BETWEEN THE BLOOD AND TISSUES.

Returning now to the relation between the blood and tissues it is interesting to note that Barcroft found that the acidosis due to *starvation*—at any rate, that due to a brief period of starvation—left the blood mesectic; in one case as studied it became indeed pleionectic; that is to say, the hydrogen ion concentration was normal or even lowered. Now to some extent the respiratory centre was responsible for this adjustment, as the CO_2 tension in the blood was *lowered*; but the centre could not adjust to the larger acidosis of continued starvation. We have seen that the supply of ammonia becomes all-important here. But we know that the circulation of β-oxybutyric acid and aceto-acetic acid also involves loss of fixed bases. It is significant that in starvation the loss is chiefly of potassium from the cells; the blood retains its sodium with avidity. The protection which the tissues obtain from the ammonia production is therefore not complete. They make a sacrifice of bases in order to keep the blood so long as possible normal in reaction. Just as we find with regard to osmotic properties that it is only the blood, and not the tissue-cell, that retains under all circumstances a nice adjustment to a mean value, so it is only the blood which tends under stress to maintain the mean value of its chemical reaction. Since the properties of the blood can only be of importance in so far as they relate to the needs of the tissues these familiar relations are somewhat puzzling. Perhaps we may conclude that, just as the less active tissues are, in starvation, sacrificed to supply energy to the more active tissues, so tissues less sensitive to changes in hydrogen ion concentration are sacrificed to those which, like the cells of the medulla, are hypersensitive. But the hypersensitiveness of these is essential to the body as a whole and the adjustment is an expression of the solidarity of the animal. At any rate, it is almost certain that the average H ion concentration of the tissues as a whole must increase in such conditions as starvation, though we have no quantitative data, I think, with regard to it. There are abundant checks to extreme change, as we are to see; but temporary and local changes are continually occurring during normal life. They are, indeed, an essential factor in the activities of tissues. As examples of extreme cases we have only to think of what is involved in the secretion of strongly acid and alkaline fluids by the gland cells; but changes of some degree are much more universal.

LACTIC ACID PRODUCTION IN MUSCLE.

It is necessary that I should now deal a little further with chemical mechanisms which regulate reactions within the tissue cells themselves. In 1907 W. M. Fletcher and I investigated the conditions of lactic acid production in muscle. The work we did was called for at the time because, old as was the interest of lactic acid in physiology, its significance had been obscured by faulty observations. It had even been asserted that there was no increase in the lactic acid of muscle even as the result of stimulation or rigor. We were able to correct this statement by demonstrating that the extreme sensitiveness of the acid-producing processes to the stimulus of injury had led to gross over-estimation of the amount in resting muscle. The acid estimated in this had been largely produced by the manipulations of the analyst. We studied, so far as we could, the rate of production of acid under various conditions. We were able to show also that an efficient supply of oxygen to the muscle caused a disappearance of lactic acid *in situ*. This had not received experimental demonstration before. But we produced some evidence to suggest that this removal does not imply actual oxidation of the lactic acid, but rather the restoration of some complex from which it originally arises. A reversal of a reaction under the influence of oxygen seems involved. We know nothing yet of chemical details in connexion with this, but the later thermodynamic studies of A. V. Hill seem fully to confirm the fact in its essentials. "The lactic acid," says Hill, "is part of the machine, not part of the fuel." It may be the product of a change which yields energy for the contraction of the muscle—a change not involving oxidation. But I conceive of the chemical mechanism which produces it as having also a somewhat different function. A very low concentration of lactic acid (in other organs as well as in the muscle) may be normal, even when the cell or fibre is resting, but an increase is always imminent. The explosion which produces it is, as it were, under the influence of a hair trigger, always cocked. A small relative failure of oxygen supply such as momentary vaso-motor constriction might induce, a small change in the permeability of membranes within the cell—if these or certain other events happen an increase of lactic acid, to some degree or other, follows promptly. On the other hand, such concentrations as I am thinking of may disappear rapidly with restoration of oxygen-supply or as the result of other reversals in conditions. But the shift of H ion concentration which the appearance or disappearance of the acid involves brings other events in its train. Rightly or wrongly, I look upon the lactic acid mechanism as an important regulator in the *tissues, not only of* "reaction," but of *reactions.*

With regard to muscle in particular, Mines[12] has even ventured to formulate as a possibility the view (which had been vaguely perhaps in the minds of many of us) that a very localised production of lactic acid in the fibre, at high concentration, is the direct cause of muscular contraction. *He points* out that there is experimental evidence to show that "the application of an acid to a colloidal *system of particular disposition of parts may give* rise to a large production of mechanical energy." Mines induces striking arguments in support of this view.

ADJUSTMENT OF REACTION IN THE TISSUES.

It is important in any case to remember that adjustments of reaction, whether towards the acid or alkaline side, may occur in the tissues depending entirely upon organic reactions catalysed by ferments. There is little doubt, as we know from the work of Dakin, confirmed by that of Neuberg, that lactic acid arises in the tissues (though probably not in muscle) *from a substance, methyl-glyoxal,* $CH_3.CO.COH$, which may itself take origin from sugar or from the amino-acid alanine, CH_3CHNH_2COOH. *Dakin points out that* in these chemical relations we have a mechanism making for the maintenance of approximate neutrality in living cells. Alanine may be converted into "neutral" methyl-glyoxal with liberation of alkaline ammonia, while the methyl-glyoxal in turn may be converted into acid lactic acid by union with water; but *the former process is inhibited by an* alkaline reaction and the latter by an acid. "Thus it is clear," writes Dakin, "we are dealing with an *exquisitely delicately adjusted condition* of equilibrium provided with automatic checks guarding against undue development of either acid or alkali." Neuberg, again, has shown that tissue ferments can convert the neutral sodium salts of the keto acids, which we know occur in the course of metabolism, into aldehydes and alkaline sodium carbonate, *e.g.*:—

$$CH_3.CO.COONa + H_2O \rightarrow CH_3COH + NaHCO_3.$$

Ferment reactions can, therefore, produce a change in the direction either of acidity or alkalinity. We see that the powers of adjustment of reaction *within the cell are great,* even as a result of metabolic processes alone.

Do not think that all this time I have been too far off *my main theme. Local changes* in the cells of an organ are followed by local changes in the blood within the organ, and these, so far as they involve changes of reaction, have *important results* for the organ itself. An increased activity in the organ calls for an increased supply of oxygen. We know that this is met by a *local vaso-dilation* which results in the transport of more blood to the cells. So far as the dilation is something more than the relaxation of previous *constriction it has been customary* to ascribe it to the action of dilator nerve impulses. But is it? Barcroft in a very admirable chapter in the book[13] which I have already quoted so much has marshalled strong arguments, largely based on his own work or that of his colleagues, to show that it is rather due to the *addition of metabolites* to the blood. Many years ago Gaskell, confirming some earlier observations of Severini, showed that very dilute lactic acid dilates *the capillaries.* Bayliss in 1901 showed that carbonic acid has the same effect. The dilatation is a hydrogen ion effect, not due to a specific acid. Barcroft's full presentation of the evidence, which *I must not stop to give you, leaves* us with no doubt that the addition of acid metabolites to the blood plays a predominant part in the normal dilation which accompanies activity. However rapidly its reaction may subsequently be adjusted, the venous blood leaving an active organ is definitely more acid than the arterial supply. Since a full supply of oxygen diminishes acid production, there is clearly an automatic adjustment possible. The beginning of activity we may picture as *raising the acidity slightly, first in the cell* and then in the capillary. The consequent vascular dilation provides more oxygen, and so checks the *further development of acidity. Here, then,* we have a very definite instance of an important effect following on a local change in the reaction on the blood.

RHYTHM OF HEART.—PRODUCTION OF ŒDEMA.

My subject as one surveys it seems almost coextensive with the whole of physiology. But I must hasten to a *close,* and will *deal only* very briefly with two other local phenomena. Various workers, and especially G. R. Mines and his colleague, Miss Dale, have shown *how great is* the importance of the reaction of the fluid which perfuses the heart in connexion with the origination and maintenance of rhythm. The different chambers respond somewhat *differently* to changes of hydrogen ion concentration, and if this factor be varied sufficiently, considerable dislocations in the beat may occur. *The variations studied experimentally during artificial perfusion* are much too large for any such to occur in the normal circulation, but local variations *may be more* extensive, and we must remember, in any such connexion, that abnormalities of less degree may, if long continued, produce results of significance.

Lastly, I will *mention* a much discussed theory in which great importance is attached to a local rise in hydrogen ion *concentration whether in the tissues or the blood.* I mean the theory of œdema advanced by Martin Fischer. If a *frog's limb* be ligatured and the animal *allowed to remain* in water, œdema *develops* with some rapidity below the ligature. It does *not appear* if the frog remains out of the water, so that *it is clearly* not due to blood pressure *changes* in the *limb itself.* The tissues below the ligature, unlike the tissues when normal, attract water *from* the *outside.* Now a considerable number *of* colloidal substances, fibrin and gelatin for instance, which tend to attract water and swell up as a result of *absorbing* it, do so with increased *rapidity* and to an increased degree when certain concentrations of acid are present. Martin Fischer's view is that *these* two phenomena are essentially the same. The tissues of the ligatured limb develop lactic acid because they are deprived of oxygen; this *increase* of acidity greatly increases their affinity for water and œdema is the result. The swelling is essentially due to a physico-chemical property of a *colloidal* system, and there is *from* Fischer's standpoint no *occasion to go* beyond or behind this property in seeking for an explanation in any case of œdema whatever. Needless to say, *in* the presentation of the theory *other* evidence is advanced; but nevertheless the swelling of the ligatured frog's *limb remains* the *experimentum crucis* on which it is based. As you are doubtless aware the theory has been criticised by many authors whom I must not stop to quote. I think you will agree that its teaching is too purely mechanical or, rather, too superficial. It leaves out of account the many subtleties involved when a living tissue responds to any kind of change. In the endeavour to avoid all that is mystical and to give us something objective it probably excludes factors of real importance. But the phenomena upon which it is based are certainly not without significance, and the theory has some advantages over others that have held the field. No one I think who has worked, say, with the isolated and artificially perfused mammalian heart, and has watched it grow œdematous while still beating, the degree of œdema —seemingly at least—depending upon the degree of acidity which has developed, can wholly ignore Fischer's views. Local acidity would seem undoubtedly to favour the occurrence of œdema, at least in some tissues; but we do not know what is the relative importance of the part it plays.

[13] The Respiratory Function of the Blood, Cambridge University Press, 1914.

SUMMARY.

Before concluding, I may attempt a brief summary of the facts and considerations which I have put before you. The hydrogen ion concentration of the blood is a variable, but the interests of the body demand that its variations should be confined within a very narrow zone of change. In the maintenance of its mean value, which is such as to make the blood a very nearly neutral fluid, a great number of factors play a part—some chemical, some physico-chemical, and others more purely physiological. When appreciable variations occur they produce striking effects, especially upon the mechanisms of respiration. Considerable departures from the normal indeed can only exist when the sensitivity of the respiratory centre is simultaneously modified. In the tissues—at any rate, in certain tissues—wider variations in the hydrogen ion concentration probably occur; but metabolic processes are nicely adjusted to the maintenance of approximate neutrality even in the tissues themselves. Any local change of reaction when it occurs may profoundly affect the general chemical equilibrium in a tissue or organ.

It is remarkable that the acidosis produced by such factors as are involved in taking exercise at high altitudes should induce more change in the actual reaction of the blood than the severer forms of acidosis occurring in a disease like diabetes. Doubtless the more gradual establishment of the acidosis favours a more complete adjustment. We have very definite evidence that variations of reaction may occur in disease and be responsible for certain symptoms, but the whole question of the range of variation in pathological states and the effects correlated with it remains for further study by modern accurate methods. I may conclude with another appropriate quotation from the address given by Dr. William Sharpey in 1862. He said: "But one of the most significant steps that have been made in modern physiology is in my judgment the general recognition of the importance of exact numerical determination, whether as to time, space, or quantity, and its general application to those phenomena of the body which are susceptible of it." Our progress depends upon the continued recognition of this importance, and fortunately we are always finding fresh phenomena which prove susceptible of quantitative study. With some of these I have been dealing.

A PLEA FOR THE DEGENERATE.[1]

BY T. CLAYE SHAW, M.D. LOND., F.R.C.P. LOND.,
EMERITUS LECTURER ON PSYCHOLOGICAL MEDICINE,
ST. BARTHOLOMEW'S HOSPITAL.

THE conferences of eugenists which are held from time to time have for one of their aims the procurement of a Utopia of physical excellence and ability, and Parliament has adopted a Bill for the segregation of those members of the community whose continuance in it as free agents is considered adverse to the well-being and prosperity of the race and antagonistic to the transmission of a healthy offspring.

The eugenists appear to have had it all their own way, but there is still something to be said for the very large class of slightly degenerate, and many will agree that in the desire to make a nation of sane and healthy people the eugenists overlook or under-estimate the curative power of nature, whilst they advocate measures some of which are unnecessary and others intolerable. Their enthusiasm blinds them to the defects of even the best educated and most intelligent people, whilst it incites them to crush out a most useful and harmless section of the population, even if it be in some respects "degenerate"—whatever may be the limits of that debatable term. For no one could rightly maintain that grades of intelligence are not a necessity or that a socialistic Hygeiopolis, where all are equal in mental and bodily development, is either desirable or possible.

In the ultra-impaired and degenerate, such as epileptics, idiots, and the lower imbeciles, it is no doubt absolutely necessary to condemn their contribution to the perpetuation of the race, and the best way of doing this is by legal restraint until extermination eventuates; but it is a doubtfully wise proceeding to limit marriage to those who are able to produce a medical certificate of validity, for one reason because we cannot always detect latent disease, and for another because our views on hereditary transmission are still in the crucible, and biometrical science is mostly in the apophthegmic stage—a matter of terse sayings of limited range. To argue that the safeguards of marriage should be tightened so as to produce only healthy stock is one thing, but to sacrifice everything to the development of educated intelligence is quite another thing, and there are plenty of proofs that the comfort and even the safety of social conditions may be violently upset by suppressed or loosened emotional storms which are just as much the accompaniment of "higher" intellectual states as they are of the "lower," if indeed they are not more intense and compelling in the former than they are in the latter. There are plenty of intelligent and educated women among the militant suffragettes, but that fact does not prevent them from breaking the law nor from establishing the dread of unexpected and impulsive violent actions engendered by bad logic and a state of monoideism.

The education of the lower orders has not tended to the peace of social systems; indeed, it is probable that in many directions it has substituted for a beneficent oppression the tyranny of agitators and the subtle influence of a systematised organisation for the accomplishment of ends sometimes unworthy.

It will be observed that those who advocate the advanced views of eugenists are mostly scientists, not physicians; they want all to be perfect and all approximately intelligent, a condition which would be as dazzling as living in perpetual sunshine with no respite of dawn, twilight, or darkness. Too much must not be expected quickly from education; and discomfort must accompany its spread. An educated monkey or a tamed lion never loses his innate destructiveness; he just learns how to become a more accomplished nuisance. When the *Education Bill* was passed in this country the Kaiser William said that it was "the beginning of the downfall of England," and however this statement may be traversed there still remains the truth that upheavals and discontent have been the accompaniments—perhaps the necessary accompaniments—of the process. The early promoters of the general and forced education of the masses probably knew this very well, and never for a moment thought that the feeding with the fruit of the tree of knowledge would have any other result than the upheaval of settled social systems—it has, indeed, been cataclysmic, bringing about a bloodless revolution and upheaval in many of the organised strata of our social system.

---

[1] A paper read before the Harveian Society on April 2nd, 1914

When the eugenists have had their way, and when disease is no more and degeneration a thing of the past, what a world of strife it will be. There will be no peace and quietness; no one to do the drudgery. As it is, the majority of people are commonplace, perhaps rather stupid, or, at any rate, not brilliant, and this wholesome leavening with mediocrity makes for the easy routine work which is of such advantage for the smooth working of the cosmic economy. To carry on the work of the world we do not want everyone to be a model of ability and excellence of structure; we require a certain number who will do as they are told, and who, as long as the conditions under which they live are humane and well-ordered, delight in the beneficent compulsion of authority, direction and guidance, and seek for nothing better. When a long-established order or arrangement is upset, and what was below is placed on the top, a new crushing force of unknown extent and intensity is developed, a power which has no experience of its new and unaccustomed existence, which in its spasmodic writhings to accommodate the environment to itself is pretty sure to make mistakes, because it tries to adjust in a day what has taken years of gradual subsidence to consolidate. And this subversion must occur when the forces of nature are interfered with by such drastic remedies as the eugenists propound—viz., the unsexing or the destruction of all degenerates and the artificial cultivation of general excellence. In the organic kingdom there is no such thing as equality, but a graduated system of complexity and excellence can be detected all through its hidden recesses and in its open manifestations, whilst in the lower developments are found a peculiar adaptability and usefulness which could not be got from the more elaborated members of the family, do not, indeed, lie within their functioning capacity.

Heredity is in many respects a blessing. If owing to it we have the transmission of tendencies of an advantageous kind it saves time and work, because it gives the individual a flying start and lessens the trouble of acquisition and of preliminary training, and, notwithstanding all the difficulties nowadays set up to the doctrines of the hereditary transmission of disease and of undesirable qualities, there must be many believers in it, else why do the eugenists go to such extreme measures for exterminating the poor specimens which, if it were not for their power of hereditary transmission, should be treated as accidental occurrences with a very limited range of ability for doing evil?

The greatest hereditary transmission is death—there is no doubt about that—and probably disease is the next. The eugenists take refuge for their measures under the plea of civilisation, but their practice is, after all, but a return to savage methods which are drastic and, as they think, beneficial to the social system, relieving it from what is irksome to it. For what is the tendency of our modern civilisation? It is really little more than the *toleration of abuses.* We let off murderers in deference to public sentiment, and we never carry out the extreme sentence on women because we are more "civilised." We treat crime as a disease and deal with it mildly. We suffer fools gladly and take the most beneficent care of them. We endure all sorts of inconvenience at the hands of strikers and allow violent coercion to proceed very largely unchecked because the "high civilisation" suggests toleration and not repression.

There are two chief classes in civilised communities: those who find the form and means for work and those who use these, and in the latter we want bodily fitness and a certain amount—not too much—of intelligence. It is quite right to do what we can to ensure the former, and if the eugenists confine their efforts to hygiene they will be working all for good; but to go to the extremes advocated by some of their members in their desire to adopt a high standard of intelligence is unnecessary, because nature steps in and provides for the early and efficient elimination of the extreme forms of degeneration by disease and death. We may assist nature by placing under lock and key every "degenerate" in the country; but it would only be a respite, the condition would soon reassert itself, because however we try to eliminate it the measures cannot touch the elements which are present in many of the lives which would be passed by the eugenists as sound, though they may only declare their existence too late and when the damage by transmission has been effected.

As for the intermediate forms and degrees, we turn them into staple commodity; they provide us with occupation for builders, architects, and governing bodies, besides an array of doctors, nurses, and attendants. If all the by-products of civilisation were cleared away there would be no scavenging to be done, and the large proportion of medium-brained toilers would be without occupation. Instead of exterminating a class which does not rise in some few particulars to the intellectual level desired by those who think they can secure breeding on fixed principles, it might be deemed more conducive to the peace and contentment of the world if some of the very "clever" people were deleted, for their criticisms of the social scheme are so much more "clever" than their suggestions for remedy. The drawback of making people in humble circumstances develop aspirations for which they are quite unfitted is that whilst the inferior occupations remain as necessary as ever the people who should carry them on become fewer—they relegate them to the recidivists instead of leaving them in the hands of those who, by their very mediocrity, provide a most important link in the social system. From their mediocrity the best of them would regularly and steadily emerge according to biological rule. If there are some members of the population who can do the work which others will not do, it may be, and I think is, the duty of the governing body to protect them; it is certainly wrong to exterminate them because they form part of a natural system which is composed of graduated elements of perfection, and which is as useless without these lower but subsidiary members as is a house without a kitchen or a reptile with its tail chopped off.

No doubt it is better to stop bad and dangerous breeding than to sequestrate and try to extirpate the results of it, but is it possible to adopt the former course? Not in the transition stage in which we now are, and inasmuch as we can never hope to attain to a fixed and final perfection it is impossible to see how care in breeding can be more than palliative. If every palpable degenerate of the moment were obliterated the supply would still go on. There are now going about with full approval as to their gametic validity all sorts of swindlers, drinkers, dishonourables, pleasure-seekers, lazybones, gossips and slanderers, men and women physically fit to perpetuate their species and who cannot in this particular be denied, but who are morally and intellectually distinctly unfit because there is ground for belief that these defects may be ontogenetic and capable of influencing progeny; indeed, this ground for belief becomes a certainty if we remember that many mental characteristics are the necessary results of certain bodily processes, and are in their sphere only another form of them. There are numbers of people in prominent places for which they are absolutely unfitted, they have been foisted upon leadership by patronage, or by family descent, or by fortuitous circumstances, and when they are in leading positions the evil they do is enormous. There is no guarantee that one who has played a leading rôle in any of the subdivisions of the life-drama is fit to have descendants; because some of even the most distinguished self-made or hereditarily marked people are so pervaded by hidden defects that they are unfit to generate, lest the weeds appear and thrive upon the good soil with which they are simultaneously projected: on the other hand, it would not be difficult to prove that a not wholly corrupt tree may bring forth good fruit.

There is often raised the cry "Where is the man?" And when he is found it is not by looking among pedigree stock—people who have had notable ancestors, but by waiting until the right person "arrives," often an unknown growth from some dark, neglected, and unsuspected corner, the spawn of which has the latent endowments which the new environment seizes upon and nourishes to its own advancement. There never occurs a crisis without its hero of the moment—it may be a woman, as the Pucelle d'Orléans, or it may be a diminutive degenerate, as was the ferocious Swiss hairdresser, the thief, the creature of hæmothymia, the infamous Marat. Now Marat was probably a degenerate, at any rate a bodily degenerate, and the eugenists might say, "Such a person would be impossible if our suggestions were acted upon, and therefore you would never have had such a bodily or mental degenerate"; but cruel and bloodthirsty as Marat was, he was yet the man of the moment, and he may have been useful by bringing about the satiety of revenge which was the turning-point in the tone of the environment, and led to a change of atmosphere demanding a different set of agents. For, after all, it is not invariable that men set up an environment; as often as not circumstances arise which require men suited to the work to be done, and so the "man of the moment" may be wicked, unscrupulous, immoral, and degenerate from the standard of mental desirableness, but his very vices qualify him for the prominence which, evil though it may seem at the time, may be the necessary prelude to a blessing. The history of human nature is that of a condition of unstable equilibrium—at one time the good factor, at another the bad element in the ascendant; but inasmuch as "good" and "bad" are relative terms it is of no use to legislate for a special class to the exclusion of others, because that favoured class may turn out to be the one undesirable and invalid at the moment. The distorted body may have a most excellent and beneficent mind, whilst an Apollo or a Hebe may be of a devilish intellect, and the system which would exterminate the one and perpetuate the other cannot be founded on right principles. The Marchioness of Brinvilliers and Beatrice Cenci would have been champion stock for the eugenists.

In one of his aphorisms Wundt says that "men think very little and very seldom." The truth of this dictum is indisputable, and it has much to do with the point we are discussing. Herbert Spencer walked about London notebook in hand, listening to and writing down the matter of the conversation of passers-by. He found it to be of the most ordinary character, chiefly personal, such as "And how was Jemmy when you left him?" or, "She never gives more than tenpence a yard for it," &c. And action, like thought, is often of the simplest kind; however difficult at first to acquire it has become an easy and self-sustaining reflex. When active thought or energy of a new kind is carried on for a long time or under stress people break down under it: the work can be done for only short periods. It is the custom to point to the great age to which scientific and other very busy men live; but when they do it is because they have as a rule an occupation which they are fitted to carry on without strain. That people cannot bear strain for long is shown by the desire for filling up positions of responsibility and activity by young men, the idea being that new work requires young material.

Though people are enabled, through the progress of hygiene, medicine, and surgery, to live longer, their active and altruistic sphere is cut short, and just when their energies and experience are at the best they have to give place to younger men. What is left for them to do? In many instances nothing. Do you suppose that the men who lounge about clubs and spend the day on golf links or croquet grounds are doing what they prefer? Not a bit of it. They are just getting through time in the easiest way, whilst many are inwardly fretting at their enforced idleness. Though placed *hors de combat* they are still of some use to the community—they pay taxes, and in amusing themselves may contribute to the gaiety of nations, but except as mere units they are of little account, and the world tolerates them as long as they are harmless; but in rendering this scant recognition the world is unjust, for by their very inactivity they leaven the surging restlessness of the crowd, and act as buffers which deaden the shocks of the to-and-fro hustling of conflicting interests—they are then most useful in their enforced leisure; they cannot be called "degenerate," and they have a serviceable rôle as honorary members of the social system. When a man reaches 60 years of age—still more

100—he may carry his own proof that he has led a fairly moderate life, but at the same time he indicates that it has not been too strenuous.

Some forms of disease are so manifestly incapacitating that no doubt can be held as to the necessity of isolating them; such are violent epileptics and advanced imbeciles and idiots. But the rule must not be made too hard and fast, and I could give instances of families where epilepsy in the parent has had no effect at all upon the children, and of high-grade imbeciles whose children are sound and bright. On the other hand, who is not at a loss at times to account for the deviation from moral rectitude, the actual mental breakdowns, the ineptitude of many whose pedigree chart seems unexceptionable? If we look at the manual and mental work done in large institutions, such as asylums and workhouses, we see that much is accomplished by degenerates, and that the best done part, too. Occasionally the quarrelsome and troublesome person is given employment to keep him quiet and to interest him, but the cleaning, the carrying, the heavy drudgery, is by preference given to the degenerates—the epileptic, the imbecile, and the idiotic—and very well it is, as a rule, done. The working expenses of institutions would be vastly increased were it not for these degenerate toilers. And so it is in the outside world. I doubt if ordinary society could be carried on without the aid of the mediocrity, the patient force which has only to keep in motion the body which has been swung into the sphere of activity by the superior mind. Just as small coinage has its advantages, so we should find the conduction of social necessities too expensive if confined to the regenerate. The eugenists want to do away with the pence and farthings, and to substitute a more showy and expensive medium which cannot do the work of its lower congener except at the price of waste and inconvenience.

To some extent the cult of eugenics has actually been a going concern for some time in an incomplete and imperfect degree, but still in action. For years thousands of insane and degenerate people have been kept in asylums, workhouses, and prisons. It will be said that many of these have been from time to time allowed to return home and to go on increasing their families, and that it would not be prudent to draw too definite conclusions from the partial enforcement of these repressive measures; but it is interesting to look round and see whether there is any tendency to improvement in social conditions since repressive measures (however imperfectly administered) have been in force. Is the law any better obeyed than it formerly was? There seems to be a rising feeling that if the law as it stands does not accord with what the "educated" mass of the people think best for its individual advantage, therefore it (the law) must be resisted until it is changed to suit their own wishes, regardless of the effect of the change on other classes of the community, the result being numerous class wars, because altruism becomes sacrificed to selfishness. It seems to be more and more unlikely that those who find the present condition fairly satisfactory will quietly submit to have it subverted; they will not consent to anarchy as the succedaneum for even an imperfect law without a struggle. "No," they say, "your proposition is a revolution, and that we will not accept unless you are able to bring superior force and establish it yourselves." When once it is seen that the revolution is successful there is sure to be a repetition of it until the social system settles down again under the rule of those who have the power and the numbers to enforce their position.

If all vice is confined in prisons and all deformity and defect is sequestered in hospitals, asylums, and sanitary homes, if pauperism is done away with by syndicalism and trades unions, if moral and physical pain are to be banished by the panaceas of faddists—if, in fact, a new world is to be regenerated by esoteric philosophy—then we must be prepared to see a change in those mental elements which at present are viewed as the traits in us of descent from a Divine origin. Altruism and pity will die a natural death, because there will be no one requiring self-abnegation and commiseration—where all are strong there will arise an inability to understand weakness. The idea (as a working hypothesis) that mental deformity is dependent on bodily impairment, and the converse, that physical integrity connotes mental adequacy, or even perfection, is not based on unprejudiced experience. The giant in strength and in grace of form is liable to abuse both; he thinks that nothing can resist him, and so he proceeds to over-functioning and to super-induced decay, whilst the weakling learns to husband what strength he has and is careful not to incur the risks of contradiction from others.

The experience from America, where in some places eugenist marriage theories have been in force, is not very favourable; the medical certificates have proved very expensive and inadequate, and people have evaded the law by quitting the State and disregarding medical impediments. It is not logic to say that because a theory is useful in its application for some cases it is therefore necessary to make it universal; because, to have this effect, the theory must be perfect. Is the theory perfect? This can surely not be upheld even by its most strenuous supporters. It is true that when disease or imperfection is markedly in evidence so that all are agreed on its existence in the individual case under observation, the enforcement of the theory may reasonably be upheld, and so there can be no doubt that the marriage of freaks, epileptics, of imbeciles and idiots, of syphilitics, and, perhaps, of the tuberculous, ought to be forbidden; but inasmuch as it is probable that an absolutely healthy person is not to be found, and that it may hence be concluded that the majority have in their organism the latent germ of disease, it is evident that the universal application of eugenics cannot be tolerated—that therefore it would be unjust to tabulate any compulsory laws to be of universal application. Indeed, in many countries everything which tends to support the ideas of eugenism is deliberately traversed. Take Germany, for instance, where among the nobility it is absolutely taboo to marry anyone who is not *hof-fähig*, which, of course, means ostracism from society functions. Royal families, where one would think that the highest physical and mental qualities were desired, are very limited in the choice of marriage possibilities, so that it often happens that consanguinity of a fairly close degree is necessitated, and this is directly opposed to eugenic theories, though it does not always in practice eventuate badly. In this country *Hof-fähigkeit* is not an inexorable law, and the aristocracy of wealth fuses readily with the aristocracy of birth—nay, more, the platforms of the marriage market have become so extended that mere good looks combined with respectability and intellectual competence are almost as good a passport to the aristocracy of birth as is that of wealth alone, all of which may be of eugenic trend and therefore desirable. That morganatic marriages were not always successful in producing the best stock, whilst very often marriages between people of the same social standing turn out extremely well, shows that it is not necessary to break down class laws by eugenic theories. It is quite fortuitous whether the result is good or bad —fortuitous, that is, as far as the matter of personal selection is concerned, though not fortuitous, but necessary, if we only knew the laws of ontology.

The brainy person is driven forward to continual striving and knows no rest, and if, as is not infrequent, his braininess is joined on to a weak bodily accompaniment, his life is a continual effort, a war against discomfort; if, notwithstanding this personal bodily degeneracy, he is yet able to add to the progress of the race, well and good—let him live and raise offspring if he desires, for though eugenically unfit he may produce a fairly healthy stock which, brought up in a healthy intellectual atmosphere, may, though not perhaps most desirable from the physical point of view, be of use to his social environment.

The man of first-rate physique is not always proportionately endowed intellectually, and he, too, is wanted and called upon to energise to an excess which is not good for him. His very strength tempts him to despise moderation, and before long he is landed in difficulties which the more moderately endowed person never feels, and so the strong man ceases at an early stage to be a practical asset. Which is the better for a nation? To have good physique and moderate, unsensational brain development, or to have extraordinary intellect and poor or indifferent bodily quality? The eugenists will say that they want both body *and* brains, and though it is true that now and then we do find these eclectic phenomena they are yet too rare to rest hopes upon; as a rule one of the two is commonplace, and the most useful social stock combination would seem to be the sound body with the medium mind, for such a man makes the best citizen: he can fight for his country; he can add his quota to the population; he is honest and not so brainy as to become a dissatisfied theorist; he may, indeed, be of such moderate mental capacity that, compared with his bodily standard, he is inferior and may be classed as degenerate, but he is able to get his living and remains a valuable potentiality even though he does not attain a theoretical adequacy. We judge, after all, by results, and however much a person fails to realise an ideal we put up with the theoretical inferiority and prefer inertia to inconvenient dynamics.

The above was written before I read a speech recently made by Sir J. Crichton-Browne at a dinner of the Sanitary Inspectors' Association, and I am very glad to find my views in harmony with so distinguished a rhetorician. I beg to quote that part of Sir James's speech which suits my purpose. He says, talking about not prolonging the lives of the unfit, that "it would emphatically *not* be better to let some of them die out. Sanitary improvement did not run counter to natural selection; it did keep weaklings alive, and weaklings often turned out to be the benefactors of the species. Slum-life was a widely destructive process; it favoured the survival of those who could subsist on a relatively small amount of nourishment and light and air."

The object of this paper is to remind us that there is now in actual force the Mental Deficiency Act of 1913 which gives ample opportunity for placing under restraint defectives of very different degrees of intensity, from the very strongly pronounced idiot and imbecile to the "moral imbecile" or the person "who from an early age displays some permanent mental defect coupled with strong vicious propensities on which punishment has had little or no deterrent effect." This clause is very vague and I doubt if it will really help much, for the phrase "some permanent mental defect" may be exceedingly difficult to put down on paper, and the whole clause implies that punishment has been tried and has failed. The really troublesome people are often those whom the law seems unable to touch, especially when alcoholism enters into the question. I saw recently a gentleman, married and with a healthy family, who is really morally imbecile and whom his friends would wish to have certified, but no medical man will take the risk of doing it. He is a graduate of a university, a distinguished athlete, and free from delusions or any mental flaw which would pass current as insanity; and yet he is a habitual drunkard, easily imposed upon by designing persons, and would be with advantage restrained—but there would be great difficulty in doing this—nothing but a *conseil de famille* could effect it. On the other hand, we all know of people who are of low intellectual standard but morally are correct; these are the people whom the law *would* enable us to sequestrate, and it is just these whom, for many reasons, it is not (as I have tried to show) desirable to remove out of the community.

It almost looks as if intelligence and morality were two distinct things, and that it is safer to have intelligence than morality; a person who has the former may get off scot-free, but to him of weak intelligence his morality is of little avail when it suits the purpose of those who have the power of sequestrating him to use it. It is against the abuse of this facility that I have ventured to address you.

Weymouth-street, W.

THE AERIAL CONVEYANCE OF INFECTION.

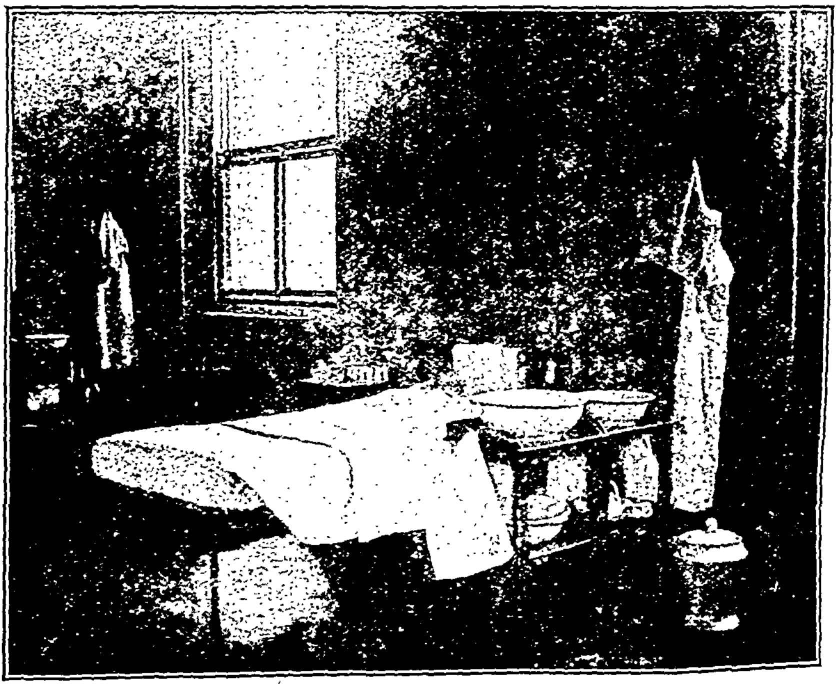
By FREDERIC H. THOMSON, M.B., C.M. ABERD., D.P.H.,
MEDICAL SUPERINTENDENT OF THE NORTH-EASTERN HOSPITAL, TOTTENHAM, N.;
AND
CLIFFORD PRICE, M.R.C.S. ENG., L.R.C.P. LOND.

There has been, and still is, very considerable difference of opinion as to the conveyance of infection by air, and while on the whole it is conceded generally that the air is not the chief vehicle for the conveyance of infectious diseases, there exists amongst the most competent observers considerable doubt as to what part the air plays in this conveyance, and certainly there has been great exaggeration in the past. Yet it appears desirable to accept views not based on sound observation with caution.

For the past five or six years we have held the view that conveyance of scarlet fever by air is improbable, but we were not courageous enough to put our view to the test, except in a limited way, until the work conducted by Dr. Claude Rundle and

Dr. A. H. G. Burton at the Fazakerley Hospital[1] became known to us.

Early in 1912 we decided to make an attempt to increase our knowledge on this subject and to treat certain infectious diseases in an ordinary ward with the precautions of cloak-wearing, cleanliness, and sterilisation. This work has nothing to do with cubicle and box ward work which has been conducted at this hospital for a number of years, the first box ward having been opened on June 15th, 1904, and the first cubicle ward on Sept. 6th, 1905, these being, as far as we are aware, the first box and cubicle wards to be put into use in this country. At the commencement we decided that, with the exception of measles, we would place in the ward sufferers from the infectious diseases ordinarily admitted to or arising in the hospital, and we did not contemplate treating measles in the ward, at all events until we had satisfied ourselves that chicken-pox was not aerially conveyed. We failed to satisfy ourselves on that point, and we therefore continued to exclude measles and modified our action as to chicken-pox.



Reproduction of photograph of ward, showing a bed with its equipment.

The ward in which we conducted the work is a modern one for 12 patients, well lighted, well ventilated, and having 195 feet floor space and 15 feet wall space for each patient. We endeavoured to avoid infection being carried from one individual to another by every means in our power and within our knowledge. Feeding and other utensils, textile goods, instruments for treatment, and so on, were either reserved for the individual or sterilised before use. For example, a penholder was kept on each patient's locker in order that it might not be a means of infecting the medical or other officers' fingers. Pedal spray basins for washing were desirable, but we did not feel justified in asking the managers to provide these, since the work was after all an experiment; accordingly we used ordinary washhand basins placed upon lockers at each bedside. We are well aware that it would have been more satisfactory to wash the hands in running water, and had it been available it is possible our results might have been better.

In contemplating the work we considered that since the diseases with which we proposed to deal were to all intents and purposes those of early childhood we would make a serious error if we departed materially from the age-periods at which these diseases particularly arise. Also we decided not to place adults or adolescents in beds intervening between different infectious diseases, as this in our opinion, would have rendered the experiment of much less value. On the other hand, however, the fact of a child being protected by a previous attack of a disease was made use of in the allocation of patients to beds. For example, a chicken-pox patient would be placed in a corner bed and next him would usually be a child suffering from scarlet fever but showing old scars of chicken-pox. At some future period, no doubt, we may find ourselves able to dispense with this use of a protected individual as a barrier, but naturally we must progress step by step. Further, the diseases were so located as to minimise the risk of the conveyance of infection as far as possible.

Such means of endeavouring to avoid the conveyance of infection as oiling the skin or specially treating the throat were entirely avoided, since we held no belief in their value, apart from the fact that the introduction of any such factors would lessen the value of the results. However, an exception to this occurred when the sister of the ward, without instructions from us, oiled the skin of one chicken-pox patient who was placed in the ward in the scabbing stage. She did this owing to her having read a discussion on the subject which had taken place at the Royal Society of Medicine.

No toys, books, papers, or other such materials were allowed in the ward, and no patient was removed from his bed for any purpose during his stay in the ward. Upon entering the ward every officer who was to touch a patient, his bed, or anything connected with him, was required carefully and thoroughly to wash the hands and scrub the nails with soap and water, and then to rinse the hands and scrub the nails in 1 in 200 lysol contained in basins at each bedside, and afterwards to put on a cloak reserved at the patient's bedside. After attending to the patient the cloak was taken off and the same washing process was gone through.

We wish to emphasise the difficulty in thinking of and legislating for possible sources of indirect infection, and we would mention, as an example, an occasion on which chocolates had been given to some of the more convalescent children, whereupon a lively child commenced throwing his chocolates to others, his example being followed by other children before the sister could put a stop to the game. This and other matters unthought of gave us ample food for reflection; and, indeed, the combination of such unforeseen occurrences with occasional cross infections, which we could not account for, so dispirited us on several occasions that we talked of giving up the work.

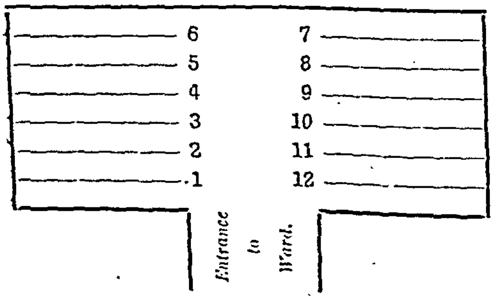
---

[1] THE LANCET, March 16th, 1912, p. 720.

Taking into consideration the detailed work necessary in the ward we decided that the nursing should be ample, and the number of nurses was as follows: for day duty, 1 sister, 2 staff nurses, and 2 probationers; for night duty, 1 staff nurse and 1 probationer or second assistant nurse. The day staff relieved themselves for time off duty, but the night staff were relieved by a nurse accustomed to the work. No alteration has been made in this staffing except that the sister for some time past has also supervised another ward of the same size for diphtheria patients.

The nurses deputed to the ward have always been specially chosen out of the best in the hospital, and we wish to express our great appreciation of the work of all of them, and particularly of sisters Miriam Williams and Helen Turner, who at different times have had charge of the ward. Without the care and enthusiasm displayed by these sisters the work would have been impossible.

For a clear understanding of our remarks the following plan showing the disposition of the beds is necessary.



We have kept a daily plan of the position of the patients with their diseases during the whole period in order that easy access to the facts concerning any given case can readily be made by anyone. Commencing Feb. 12th, 1912, 274 patients were treated during a period of two years. As some of these patients suffered from more than one disease the number of individual diseases is necessarily more, and amounted to 332.

TABLE I.—*Showing the Number of Patients Treated and the Disease from which they Suffered.*

* 1 septic. † 1 septic. ‡ 2 septic. ‖ 2 infected in ward.
§ 6 infected in ward.

Secondary Infections.

All secondary affections that arose are called attention to below.

1. *Scarlet fever.*—112 cases of scarlet fever, including 4 septic cases, were treated in the ward and 2 cases which were infected in the ward. In 75 cases scarlet fever existed alone, 3 being septic; while in 37 cases it existed in combination with other infectious diseases, as shown in Table I., one case being of the septic type. Of the 112 cases 78 were admitted during the first week and 34 at a later period. Two cases of secondary infection occurred, the first on Dec. 24th, 1913, and the second on Dec. 25th, 1913, practically 22½ months after the opening of the ward; one case was of the aseptic type and the other the mild form. Both cases were left in the ward. During this period of 22½ months 103 cases of scarlet fever had been treated with no case of secondary infection. At the time of infection there were 12 cases in the ward, 4 being scarlet fever and occupying Beds 2, 3, 4, and 5. The patients infected were on the opposite side of the ward in Beds 8 and 11.

With regard to the day of disease of the cases (which may have been the source of infection) at the time of infection, in Bed 2 scarlet fever was in the fifth week of the disease; in Bed 3 at the commencement of the third week; in Bed 4 in the fifth week; and in Bed 5 at the beginning of the third week.

Regarding the mode of infection the only circumstances differing from the usual were: (*a*) that a nurse who was not quite up to the work was shifted out of the ward on Dec. 19th—i.e., six days before the first case, after being in the ward for a week; and (*b*) that on Dec. 19th she was replaced by another nurse who remained until Dec. 26th. This nurse had unknown to us a septic finger which probably prevented her from washing her hands properly. This, in all probability, was the origin of the infection.

2. *Diphtheria.*—63 cases were treated, and in 49 diphtheria was the sole disease, while in 14 cases it existed in combination, as shown in Table I. 33 cases were admitted in the first week of the disease and 30 at a later period. No secondary cases occurred.

3. *Rötheln.*—Six cases of rotheln were admitted—4 on the first day of the disease and 2 on the second day. In 4 cases rotheln was the sole disease; in 1 case it existed in combination with whooping-cough and in another with scarlet fever in the convalescent stage. No secondary cases occurred.

4. *Mumps.*—10 cases were admitted from the receiving room or isolation wards and 1 from a scarlet fever ward; 8 cases were admitted on the first day of disease, 1 case was admitted on the second day, 1 on the third, and 1 on the fifth. No secondary cases occurred. The case admitted from the scarlet fever ward on the first day of mumps gave rise to four secondary cases in that particular ward.

5. *Whooping-cough.*—47 cases (including 2 infected in the ward) were treated. In 31 cases it was the sole disease; in 16 in combination. 22 cases were admitted during the first week of disease, including the 2 infected in the ward; 11 cases in the second week; and the remainder at a later period of the disease. Five cases of infection occurred: 2 cases developed whooping-cough in the ward and were kept there; the other 3 cases developed whooping-cough in cubicles to which they had been removed.

First infection.—Bed 1: The patient developed whooping-cough on May 1st, 1912. Infected April 18th or before. Two cases of whooping-cough were present in the ward at this period. Bed 11: Whooping-cough of 7 weeks' duration. Bed 12: Whooping-cough of 3 weeks' duration. There were also present 3 patients with a history of whooping-cough and 7 (including the infected case) with no history.

Second infection.—Bed 4: The patient developed whooping-cough on May 7th, 1913. Infected April 24th or before. Three cases of whooping-cough were present in the ward at the time of infection. Beds 5 and 6: Whooping-cough of 2 weeks' duration, April 24th. Bed 7: Whooping-cough of 4 weeks' duration, April 24th. There were also present 2 patients with a history of whooping-cough and 7 (including the infected case) with no history.

Third infection.—Bed 8: The patient developed whooping-cough on June 12th, 1913. Infected May 30th or before. Three cases of whooping-cough in the ward at the time of infection. Bed 5: Whooping-cough of 4 weeks' duration on May 30th. Bed 6: Whooping-cough of 6 weeks' duration on May 30th. Bed 7: Whooping-cough of 2 weeks' duration on May 30th. There were also present 2 patients with a history of whooping-cough and 5 (including the infected case) with no history.

Fourth infection.—Bed 1: The patient developed whooping-cough on June 22nd, 1913. Infected June 9th or before. Three sources of infection possible. Bed 5: Whooping-cough 6 weeks' duration on June 9th. Bed 6: Whooping-cough of 7 weeks' duration on same date. Bed 7: Whooping-cough of 4 weeks' duration, same date. There were also present 2 patients with a history of whooping-cough and 6 (including the infected case) with no history.

Fifth infection.—Bed 9: The patient developed whooping-cough on July 15th, 1913. Infected July 2nd or before. Three cases of whooping-cough in the ward at the time of infection. Bed 6: Whooping-cough of 5 weeks' duration, July 2nd. Bed 7: Whooping-cough of 4 weeks' duration, same date. Bed 8: Whooping-cough of 2 weeks' duration, same date. There were also present 1 patient with a history of whooping-cough and 7 (including the infected case) with no history.

6. *Measles.*—No case of measles was knowingly admitted into the ward, but 2 cases admitted for other diseases were incubating measles. They were removed from the ward as soon as recognised. From the first case 5 secondary cases resulted, and from the second case 2 secondary cases.

First case.—The patient, occupying Bed 3, admitted on July 11th, 1912, developed a prodromal measles rash and Koplik spots on July 21st and was at once removed from the ward, which contained at that time 11 other patients, 4 being protected in so far as they had a history of previous measles, and 7 being unprotected. (*a*) Five secondary cases resulted in Beds 1, 5, 8, 10, and 12; 4 developing in the ward and 1 (Bed 10) developing at home, having been discharged. These 4 cases were immediately removed from the ward on the first signs of measles, thus 2 unprotected cases escaped infection. (*b*) One of these cases (Bed 2) developed measles as a tertiary case; the other, who had been discharged, was a sister of the child who developed measles at home, and she became infected at home. When the 4 secondary cases and 1 tertiary case were removed the ward was filled up with new patients who all had a history of previous measles.

Second case.—Bed 2: The patient, admitted on Feb. 18th, 1913, on the fourth day of scarlet fever, developed measles on the third day after admission to the ward. She was removed from the ward at once. There were 11 other patients in the ward at the time, 6 being protected and 5 unprotected. Two secondary cases arose in Beds 3 and 9.

7. *Chicken-pox.*—Twenty-four cases were treated in the ward. Eighteen cases were introduced into the ward in various stages of the disease, while 6 cases which were infected were left in the ward. Eight secondary cases arose, 6 developing in the ward and being left there, and 2 cases developing in cubicles to which the patients had been removed. Of the 18 cases introduced into the ward the following shows the stage in which introduced:—Three cases on the first day; fresh lesions after admission to ward. Two cases on the second day; fresh lesions after admission to ward. Four cases on the third day; 3 cases had vesicles on day of admission, but none after admission to the ward. One case had a fresh crop on day after admission to the ward. Four cases on the fourth day; 3 in pustular and scabbing stage, and 1 with fresh crop of vesicles on the fourth day. Two cases on the fifth day; in pustular and scabbing stage. Two cases on the sixth day; in scabbing stage. One case on the seventh day; in scabbing stage. In addition the 6 cases infected were left in the ward.

First case.—Bed 7: Second day of chicken-pox eruption; fresh crops in ward. Nine other cases in ward, 2 protected, 7 unprotected. No special nursing. No secondary cases.

Second case.—Bed 6: First day; fresh crops in ward. 8 other cases in ward. Three protected, 5 unprotected in ward. No special nursing. No secondary cases.

Third case.—Bed 6: First day; fresh crops till fourth day. Eleven other cases in the ward; 4 protected, 7 unprotected. No special nursing. Infected two patients—viz., the occupants of Beds 8 and 9. These were left in the ward, and another patient unprotected was admitted to Bed 12, making 6 protected cases and 6 unprotected cases. Special nursing was adopted with these secondary cases. These secondary cases infected 3 cases—the occupants of Beds 4 and 12 (left in ward) and the occupant of Bed 1, not in ward when chicken-pox developed. These 2 cases, special nursing, left 3 unprotected cases, who escaped.

Fourth case.—Not introduced until 6 months after 3 last infections, then on Oct. 9th, 1912. Bed 1: First day; fresh crops in ward. Ten other cases in the ward; 5 protected, 5 unprotected. Special nursing. No secondary cases.

Fifth case.—Bed 1: Seventh day; scabbing. Ten other cases in the ward; 3 protected, 7 unprotected. Special nursing. No secondary cases.

Sixth case.—Bed 1: Nov. 26th, second day; fresh crop next day. Special nursing. Eleven other cases in the ward; 6 protected, 5 unprotected. Infected occupant of Bed 12 (chicken-pox, Dec. 14th); left in ward. Special nursing. Among 6 protected, 4 unprotected. Infected occupant of Bed 7 (chicken-pox, Dec. 30th); left in ward. Special nursing. Leaving 7 protected, 3 unprotected. Infected occupant of Bed 5, who developed chicken-pox in Ward 7 (a cubicle ward), to which he had been removed.

Seventh case: Bed 1: Fifth day; pustules and scabs.

Special nursing. Inadvertently the skin was oiled by sister. Eleven other cases in the ward; 2 protected, 9 unprotected. No secondary cases.

Eighth case.—Bed 1: Fifth day; pustules and scabs. Eleven other cases in the ward; 7 protected, 4 unprotected. Special nursing. No secondary cases.

Ninth case.—Bed 1: Sixth day; pustules and scabs. Ten other cases in the ward; 1 protected, 9 unprotected. Special nursing. No secondary cases.

Tenth case.—Bed 1: Sixth day; pustules and scabs. Ten other cases in the ward; 2 protected, 8 unprotected. Special nursing. No secondary cases.

Eleventh case.—Bed 1: Fourth day; pustules and scabs. Ten other cases in the ward; 7 protected, 3 unprotected. Special nursing. No secondary cases.

Twelfth case.—Bed 1: Fourth day; pustules and scabs. Six other cases in the ward; 3 protected, 3 unprotected. Special nursing. No secondary cases.

Thirteenth case.—Bed 1: Fourth day; fresh vesicles, but not in ward. Eleven other cases in the ward; 5 protected, 3 doubtful, 3 unprotected. No special nursing. No infection.

Fourteenth case.—Bed 1: Fourth day; pustules and scabs Three other cases in the ward; 1 protected, 2 unprotected. No special nursing. No infection.

Fifteenth case.—Bed 1: Fourth day; vesicles and pustules profuse. No fresh lesions in ward. Ten other cases in the ward; 4 protected, 6 unprotected. No special nursing. No infection.

Sixteenth case.—Bed 1: Third day; vesicles and pustules. No fresh lesions in ward. Seven other cases in the ward; 4 protected, 3 unprotected. No special nursing. No infection.

Seventeenth case.—Bed 1: Third day; vesicles; fresh vesicles next day. Eleven other cases in the ward; 3 protected; 8 unprotected. No special nursing. No infection.

Eighteenth case.—Bed 1: Third day; vesicles and pustules profuse. No fresh lesions in ward. Eleven other cases in the ward; 4 protected, 7 unprotected. No special nursing. No infection.

"Special nursing" means that the senior nurse on day or night duty was detailed off to look after the chicken-pox case, and was not allowed to touch any other patient except protected ones, and no other nurse was allowed to touch the chicken-pox patient or anything connected with him. At first we admitted chicken-pox patients to the ward in the earliest obtainable stage of the disease, and although the resultant cross infections were less than one would have anticipated in an ordinary ward we felt afterwards that it was unsatisfactory to admit chicken-pox in its earliest stages. However, from observations made by us before the opening of the ward we had thought that chicken-pox did not remain infectious so long as was generally supposed. Therefore, as will be noted in the list of cases, we commenced later on admitting chicken-pox at a more advanced stage of the eruption, with the intention of working backwards in order to find the earliest period of the disease at which we could place it safely in the ward. No cross infection occurred, although the last three cases of the series were admitted to the ward as early as the third day of the eruption, and in these no special nursing was employed.

We strongly protest against any deductions being drawn from lists of different infectious diseases treated in the same ward unless the days of disease upon admission to the ward and the ages of the patients are clearly stated, and, when it can be verified, the number of protected and unprotected individuals.

As the result of our experience we feel we can assert that we could treat these infectious diseases in one ward, almost certainly, with perfect safety were we to select the day of the disease on which to admit them. We are in some doubt as to the conclusions to be deduced from our experience, but we feel satisfied that the treatment of the above diseases is more satisfactorily carried out in this class of ward than in a cubicle ward—that is, rooms with incomplete partitions between the patients. It is open to perfect supervision by the sister and senior night nurse, everything that is done can be seen by the staff, and patients frequently comment on the routine. For the treatment of diseases when they are not conveyed by air such a ward as ours is also possibly better than box wards (rooms with complete partitions). It must not be lost sight of that the ward is a thoroughly well-ventilated one, and ample space is allowed for the patient. We have no experience of ill-ventilated or overcrowded wards, and consequently our chief deductions do not refer to any other conditions than those obtaining in our own particular ward.

We think our evidence in the case of scarlet fever goes somewhat strongly to show that the infection is probably not air-borne. The evidence as to whooping-cough is less definite and we are in some doubt as to whether it may be occasionally air-borne or not. It is to be noted that the whooping-cough infections occurred in summer, when the ventilation was even more free than in winter. We think it fair to assume that the infection was not carried by the staff, at least not in each instance, for had negligence been occurring cross infection of scarlet fever most probably would have arisen also.

From our experience in this and other wards we believe that the infection of measles is probably air-borne early in the disease, but that the power of infection soon passes. We are inclined to think that the infection of chicken-pox is air-borne early in the disease, but our experience goes to suggest that on and after the third day it is probably not air-borne; in our view this probability is the most interesting outcome of the work. For many years we have held that diphtheria infection is *not air-borne*. No cross infections arose from German measles or from mumps, but the small number of cases treated scarcely warrant any definite conclusion. On the whole, however, from this and previous experience in other wards, we tend to the view that they are probably not air-borne.

In conclusion, we wish to say deliberately that we would rather place a child of our own into this ward, as it is conducted, than into any other ward in the hospital.

THE EXPERIMENTAL PRODUCTION OF PURPURA IN ANIMALS

BY THE INTRODUCTION OF ANTI-BLOOD-PLATE SERA.

A PRELIMINARY COMMUNICATION.

By J. C. G. LEDINGHAM, M.A., D.Sc., M.B. ABERD.,
CHIEF BACTERIOLOGIST, LISTER INSTITUTE, LONDON.

DURING the past few years a considerable amount of attention has been directed to the part played by the blood platelets in the process of blood coagulation and to the significance of abnormal blood-plate counts in those clinical conditions which have been grouped under the general heading of the Hæmorrhagic Diathesis. Opinion has been growing steadily that the function of the blood plates in maintaining the normal coagulability of the blood by supplying an indispensable thrombogenetic element may be an all-important one, and that any derangement of that function, as manifested, for instance, by a much reduced plate content, is liable to be associated with purpuric lesions, delayed blood clotting, and the like. The experiments recorded in this note carry the matter to a further stage, inasmuch as they demonstrate the possibility of reproducing at will the purpuric condition in animals, and consequently afford a ready means for the obtaining of suitable material for further studies connected with the etiology and therapeutics of the condition.

Experimental Data.

In the course of some work, the primary object of which was to determine whether phagocyted blood plates might simulate certain forms of cell inclusions, an anti-blood-plate serum was prepared. Blood plates were obtained by the usual method of fractional centrifugalisation of citrated human blood, and almost completely freed from admixture with red cells. The deposit of plates was finally washed in physiological saline and inoculated intravenously into rabbits in a series of successive doses. The serum of the immunised rabbits was found to contain agglutinins for human blood plates and also for human red cells, as Cole (1908) had previously shown. In the presence of this antiplate serum phagocytosis of blood plates took place, but the serum did not appear to be very powerful in this direction, and it was felt that another system might be employed with advantage.

The difficulty of obtaining a sufficient amount of fresh human blood from which to isolate blood plates in any quantity rendered it impossible to effect an intensive immunisation of the animals. Resort was therefore had to guinea-pig blood plates. By a fortunate circumstance guinea-pig blood could be obtained in large quantities, as over 100 animals are killed in the Institute every week for another purpose (viz., the routine testing of milk for tubercle bacilli). The blood obtained from 20–30 guinea-pigs (160–250 c.c.) was received into 2-3 times its volume of 1 per cent. sodium citrate in physiological saline. The whole mass was centrifuged for a period just sufficient to throw down the red cells and leave a cloudy supernatant fluid. This upper fluid, which contained the blood plates with a slight admixture of red cells, was then removed and centrifuged completely, yielding a white deposit. The latter was then freed from red cells as completely as possible by fractional centrifugalisation and used for the immunisation of rabbits.

It may be noted that from 20-30 guinea-pigs a yield of about 0·5-1 c.c. volume of white blood-plate deposit was usually obtained. At each inoculation the rabbit received either the half or the whole of this amount in saline suspension. Seven to eight injections were given intravenously at intervals of 6-8 days. The animals bore the injections well.

Action in vitro of the Antiplate Serum.

Guinea-pig blood plates were almost instantaneously agglutinated by the antiplate serum in high concentration, and definite agglutination was observed in a 1 in 128 dilution of the serum. Guinea-pig red cells in saline emulsion were also intensely agglutinated by the antiplate serum, and definite agglutination occurred in a 1 in 2048 dilution of the serum.

It has to be observed that, in testing agglutination of red cells, blood plates are always present in the emulsion, and it has still to be determined how far the intense agglutination of red cells is due primarily to agglutination of the blood plates with subsequent mechanical entanglement of the red cells. Whether the action on the red cells is primary or secondary may be a point of great importance when we come to consider the action of the antiplate serum *in vivo*. In a hæmolytic system, each tube of which contained 0·5 c.c. amboceptor dilution (inactivated antiplate serum), 0·5 c.c. complement (guinea-pig serum 1 in 10), and 0·5 c.c. guinea-pig red cells (2 per cent. suspension), immediate agglutination of the red cells occurred in the higher dilutions of the amboceptor, and thereafter lysis of the agglutinated cake of red cells proceeded slowly. Complete lysis of the cake did not occur in any tube, but grades of partial lysis occurred after standing 24 hours in tubes containing amboceptor in dilution of 1 in 128. The effect was in marked contrast to that obtained by an ordinary anti-guinea-pig red cell serum, which gave complete lysis in the higher dilutions of amboceptor without obvious antecedent agglutination.

Toxic Action of the Antiplate Serum.

The action of this serum *in vitro* was so striking that it was determined to test whether any toxic effects occurred *in vivo*.

Intravenous inoculation of the serum.—A guinea-pig of 300 grm. weight was given 1·5 c.c. serum in the jugular vein. It recovered easily from the slight operation and appeared quite active for a time. At the end of an hour and a half, however, the animal was found collapsed and death took place. Post mortem some free blood was found in the peritoneal cavity and on the surface of the liver. The blood had a reddish-brown tinge and was somewhat grumous. Blood from the heart emerged as a purplish granular fluid, and it was readily demonstrated that the red cells were completely agglutinated. This blood clotted quite normally, but the clot showed little tendency to retract.

Intraperitoneal inoculation of the serum.—A guinea-pig of 500 grm. weight received 1 c.c. of antiplate serum intraperitoneally on May 8th. About an hour after the injection the animal became sluggish and did not move readily on excitation. On the following morning (May 9th) it had quite recovered and it remained well on the 10th, but on the 11th it was found dead. Numerous subcutaneous hæmorrhages were found in the abdominal wall. The peritoneum contained free blood, and there were extensive hæmorrhages in both tunicæ vaginales. The blood from the heart had a purplish granular appearance as in the previous animal.

Subcutaneous inoculation of the antiplate serum—This method, which yields the most striking results, has been employed repeatedly, and the picture obtained is almost invariably the same. A subcutaneous inoculation in the groin of 1 c.c. o the serum gives rise on the following day to a hard subcutaneous swelling extending to the centre o the abdomen. On the next day the swelling has extended to the lower part of the sternum, and o the third day to the neck. As a rule the subcutaneous swelling becomes softer as the disease progresses. Purpuric spots have been noted on th external skin after parting the hair in whit animals. The animals usually die on the third o fourth day. Post mortem one finds an extensiv hæmorrhagic infiltrate over the front of the abdominal wall. Numerous petechiæ are present i other remote parts—viz., on the under surface o the skin, the lungs, diaphragm, epicardium, an intestinal serosa. In one animal, which receive the dose of serum subcutaneously in the dorsa region, the skin on reflexion was found to presen an enormous number of hæmorrhages of all sizes simulating exactly the purpuric condition, and internally an enormous hæmorrhage was found in the mesentery of each Fallopian tube. The lymph glands in these animals have a bright red appearance and are consequently striking objects, while the spleen shows some enlargement and turgidity. The adrenals are quite pale, and the liver has a yellowish colour. The blood in the heart, if examined immediately after death, always presents a pale granular appearance, which is due to complete agglutination of the red cells.

Another interesting feature which these subcutaneously inoculated animals show is a form of cataract (double). This condition has been noted a few hours before death, and in animals which have died during the night the condition has been almost invariably observed post mortem. The isolated lens in these cases shows what might be described as a cup-shaped peripheral opacity, but at present a full description of this interesting condition must be withheld, as it is still the subject of study.

Systematic blood counts have not yet been made in the course of the disease, but isolated observations reveal a progressive fall of the red cells, counts as low as a million and a half being recorded. Numerous nucleated red cells also appear, and large swollen megalocytes. It is proposed to study fully the changes in all the cellular elements. The pathological histology of the organs, and particularly of the hæmopoietic system, promises to be of great interest, but so far it has only been touched. Examination of the red lymph glands on stained films shows numerous free red corpuscles generally collected in clumps and numerous micro- and macrophages stuffed with ingested red cells. Similar cells are seen in the spleen and also in the material from the local hæmorrhagic infiltrates. It is therefore clear that the red corpuscles which are agglutinated by the antiplate serum, either *primarily*, or secondarily through the mediation of the agglutinated plates, are removed by the lymph channels from the extravasation areas to the lymph glands, where they are further broken down.

The actual mechanism of the hæmorrhage may, it is hoped, find solution with further study of the lesion in all its stages. The agglutination of the red cells has constantly been observed in specimens of blood obtained by pricking the ear of animals during the second, third, and fourth days of the disease. The blood on emerging from the ear has a granular appearance, and when placed on a slide and gently agitated settles out into large red flakes. Clotting is delayed, and there is *little* tendency for the clot to retract. In several cases during the later stages of the disease it has been found extremely difficult to stop the oozing from the small puncture in the ear vein. A study of the coagulation time of the blood at all stages is being undertaken.

General Discussion.

The fact that a condition resembling purpura hæmorrhagica and presenting other features associated with the hæmorrhagic diathesis can be produced in animals by inoculation with an antiplate serum adds a further link in the chain of evidence connecting the blood plates with the phenomenon of blood coagulation, and with some of the derangements of that mechanism as manifested in the various types of the hæmorrhagic diathesis. A full discussion of the important rôle played by the blood platelets in the process of blood coagulation will be found in the careful experimental study of this subject by Bordet and Delange (1912). The properties of antiplate sera have been studied mainly from the serological point of view by various authors—Marino (1905), Cole (1908), Chevrel and Roger (1907), Le Sourd and Pagniez (1908), Sacerdotti (1908), Stschastnyi (1909), and others. Much of their work has been undertaken with the view of establishing the specificity of these sera for blood plates, and the matter cannot yet be considered as settled. In this connexion it may be observed that an absolutely pure antigen cannot perhaps be obtained, and consequently the demonstration of specific properties in the antiserum can rest only on a quantitative basis. Further research is needed on this aspect of the question.

With regard to the action of these sera in the body Le Sourd and Pagniez, who worked with antisera to rabbit platelets (immunisation of guinea-pigs with rabbit plates), found that intravenous injection of the sera into rabbits led to a disappearance of the blood plates from the circulation. This disappearance lasted for 24–36 hours, but ultimately the plates returned to normal proportions. During the phase of absent plates the blood clot showed no tendency to retract, but the retractility returned with the return of the plates.

It must be noted that a very transitory fall in the number of plates in the circulating blood can be produced by the injection of other antisera—e.g., ordinary hæmolytic sera—and even normal sera. According to Le Sourd and Pagniez, after injection of hæmolytic serum the plates returned in half an hour. It is further claimed by Achard and Aynaud (1908) that the injection into the blood of various colloidal substances, such as electrargol, egg albumin, egg lecithin, &c., may cause a temporary disappearance of the blood plates.

Le Sourd and Pagniez were unable to show that their antiplate sera had any appreciable toxic action; and Sacerdotti, who worked with antisera obtained by immunising rabbits with dog blood plates, found that the serum was not toxic for dogs except in large doses and in young animals. It is highly probable that the sera with which these authors worked were not strong enough to show toxic effects or to produce lesions at all similar to those described in this communication. The total amount of rabbit plates used by Le Sourd and Pagniez throughout the whole course of immunisation of the guinea-pig was only that derived from 250–400 c.c. of rabbit blood. However, one cannot generalise from an ascertained effect on guinea-pigs to a probable similar effect of a *powerful* antiplate serum on rabbits or dogs. This question must be left for further research.

Finally, mention should be made of the work which has been done on the variations in the plate content in various forms of purpura in man, and in this connexion I may refer to the work of Duke (1912), who made a study of the blood plates in 31 cases of hæmorrhagic disease. Of these cases, 17 had normal or slightly increased counts, while 14 had very low counts (below 65,000 per c.mm.). His general conclusion was that when the plate count descends below a level of 60,000 there may be an *abnormal* tendency to bleed (as measured by the time taken for the blood to stop flowing from a cut in the ear lobe); when the count descends below 10,000 this tendency is always present, and when below 1000 it is present in its most severe form. The observation of

Le Sourd and Pagniez, *that during the stage of absent plates the blood clot does not retract*, was confirmed by Duke in the human cases, and supports the original statement by Hayem that *blood freed from blood plates does not retract*.

Conclusion.—A condition resembling purpura and presenting other features of the hæmorrhagic diathesis can be produced in guinea-pigs by inoculation of an antiserum prepared by immunising rabbits with guinea-pig blood plates.

TUBERCLE OF THE CRUS CEREBRI SIMULATING ENTERIC FEVER.

BY FREDERICK E. WYNNE, M.B. DUB., D.P.H.,

MEDICAL OFFICER OF HEALTH, WIGAN; HONORARY PATHOLOGIST, ROYAL INFIRMARY, WIGAN; HONORARY CONSULTING SURGEON, LEIGH INFIRMARY.

THE diagnosis of enteric fever in its early stages is so difficult and such a constant source of anxiety both to the general practitioner and to those in charge of isolation hospitals, and the number of conditions which may be mistaken for it by competent observers is so numerous, that it should be worth while to record some particulars of a comparatively rare condition in which the earlier manifestations presented a clinical picture very difficult to distinguish from enteric fever.

This case, moreover, is one of a considerable number coming within the scope of my own recent experience which illustrate the danger of placing too implicit reliance on the Widal reaction in diagnosis. Without minimising its value when properly applied one is justified in pointing out that it is a method in which the personal equation is very considerable, and I have known more than one doubtful case in which discrepant results were recorded by different observers. I have also had charge of a number of cases in which a "positive" reaction was unassociated with any clinical evidence of the disease in its later stages. Not all of these were ambulatory cases, for several of them developed in other and quite definite directions. The simple process of taking a blood tube and examining it or sending it away to be examined must not be allowed to become an easy substitute for careful and accurate observations of the purely clinical aspect of the case, and I am inclined to the belief that a "positive" result should only be regarded as conclusive if it occurs in considerably higher dilutions than those with which many observers are satisfied.

CASE 1.—The patient a girl aged 20, was notified to me as suffering from enteric fever and admitted into the Wigan isolation hospital on May 8th, 1912. She was a well-nourished girl and worked in a cotton mill, but was somewhat anæmic when admitted. Her home conditions were bad, and she came from an insanitary house in an area from which several cases of enteric fever had recently been notified. There was a history of a week's illness with continued fever, constipation, distended abdomen, and foul tongue. An examination of the blood had given a "positive reaction," dilution not stated. Throughout her illness headache had been a marked feature. Her temperature on admission was 100° F., her pulse 80, regular and normal in volume and frequency. Her respirations, however, were 28 per minute, and continued throughout her illness to show a frequency out of proportion to that of the pulse, only occasionally dropping to 20, and never below that.

The abdomen was slightly distended, but not more so than might be expected in view of the constipation which was present. There were no spots. The splenic dulness was increased, but the spleen was not palpable. The tongue was uniformly covered with a light brownish fur, the teeth were defective, and the breath most offensive. A further blood examination showed that there was no clumping in dilutions above 1 in 40, and as it was found that the patient had been in the hospital a year previously with an undoubted attack of enteric fever the doubtful results of the blood test could be ignored. The bowels were evacuated by an enema, and the result was a well-formed normal-looking motion. She complained of intense persistent bilateral frontal headache, but had no other symptoms, and took a fairly liberal diet quite well. She had no cough, but there was a small area of slight dulness and increased vocal resonance immediately below the right clavicle. The urine was normal in quantity and quality.

On the day following admission the headache was much better, and this improvement was maintained, but the temperature fluctuated within a few decimal points of 100°, without definite morning remissions. On the afternoon of her fourth day in hospital the nurse noticed that the girl's left pupil was dilated, and two hours later, at 5 P.M., she had an epileptiform convulsion. This passed off after a few minutes, but left her with the pupil still dilated and homonymous diplopia which lasted for five hours and then disappeared. By the next morning her temperature had fallen to normal, she had no headache or diplopia, and felt very well, but the dilatation of the pupil persisted, and there was no reaction either to light or convergence. An examination of the fundus showed nothing abnormal. She remained in this condition for three days, with the temperature oscillating quite irregularly between normal and 100°, the pulse averaging 96, and respirations 24. But on the eighth day after admission the diplopia reappeared and persisted throughout the case. I found that on the left side the image was displaced downwards and to the right, there was complete loss of convergence, the other ocular movements were limited, and there was already slight proptosis. The temperature took on a definitely hectic type, with regular morning remissions, but not rising above 101°. Antisyphilitic remedies were freely tried, but without any effect.

On the sixteenth day after admission there was marked weakness of the right hand, with some tremor, and the headache returned. From this period the symptoms developed very rapidly. The right hand became completely paralysed, and the paresis gradually extended upwards to the forearm and arm, with characteristic tremors. Before paralysis was complete the arm if extended was dropped in a series of jerks. Oculo-motor paralysis on the opposite side became complete, with marked proptosis. The headache returned and persisted;

there was typical cerebral vomiting. Articulation and deglutition were affected by commencing hypoglossal paralysis, and the mental condition became dull, threatening complete dementia. The temperature continued to be hectic in type, its range increasing up to 102°. By this time the picture of Benedikt's syndome was complete, and the diagnosis of a tumour of the left crus cerebri was established. On July 16th the patient was removed to the Royal Albert Edward Infirmary, Wigan, and on the 18th chloroform was administered, and Mr. E. H. Monks trephined over the left temporal bone. In view of the hectic temperature the brain was deeply explored for pus, but none was found. For several days after the operation the headache was relieved and the mental condition improved. Vision was found to be 8/12 in the affected eye, and the disc remained normal. By the beginning of August, however, her mental condition again became duller, and a hernia cerebri began to develop. Trophic changes became marked, and there was loss of vitality of the soft tissues. She finally became comatose, and died in this condition on Sept. 9th.

On post-mortem examination I found a small yellowish nodule on the surface of the cerebellum. The whole of the left crus was replaced by a hard mass with ill-defined limits, and five small masses similar to that in the cerebellum were found in the cortex cerebri. These tumours, which were about the size of lentils, were distributed on both hemispheres, they were clearly defined, and could be easily enucleated from the surrounding tissues. On microscopic examination the whole of these masses were found to be tuberculous, and numerous tubercle bacilli were demonstrated in the sections. There was a small tuberculous lesion in the apex of the right lung. This was caseous in the centre and surrounded by dense cicatricial tissue. The other organs were healthy.

CASE 2.—An interesting sequel to the above case is provided by the fact that a sister of the patient was recently notified to me as a case of enteric fever, and admitted into the isolation hospital with a positive Widal reaction in dilutions up to 1 in 60. This second girl presented nearly all the symptoms that one habitually associates with enteric fever, although no spots were apparent on the skin; and a characteristic of the genuine cases of this disease occurring locally at this period was an unusually exuberant eruption of spots. On the other hand, her abdomen was distended and tympanitic to an extent that made any attempt at deep palpation inadvisable, and she had diarrhœa with stools of a character consistent with the diagnosis. My own attempts to isolate any bacillus of the typhoid group proved negative. The temperature chart for six days after admission to hospital was quite typical of enteric fever, and the case was entered on my books as one in which the diagnosis was confirmed. Then came a sudden, a dramatic, drop in the temperature, which remained normal for several days, while the girl improved in health, appetite returned, and all "typhoid" symptoms vanished. As the meteorism disappeared it became possible to examine the abdomen more accurately, when it was at once found that the whole of the lower part of the cavity was filled with a doughy tumour, dull on percussion, and displacing the intestines upwards. Von Pirquet's test gave a negative result, but an injection of tuberculin was followed by a marked general reaction, and the temperature assumed the character known as "typus inversus," marked by a morning rise to between 99° and 100° F., with evening remissions to normal or subnormal. This girl has no symptoms or signs at present of any pulmonary mischief, but I think there can be no reasonable doubt that she is the subject of abdominal tuberculosis in an advanced degree.

The history of these two cases appears to me to be worth recording inasmuch as they illustrate the difficulties with which competent observers are still beset in attempting the early diagnosis of enteric fever, the admirable imitation of enteric symptoms which the tubercle bacillus, operating in very different parts of the organism, can accomplish, and the danger involved in too implicit a reliance on the Widal test in moderate dilutions. I have to express my thanks for much help in connexion with the first case to Dr. F. Rees, honorary physician, Mr. Monks, honorary surgeon, and Dr. J. Oag, late house surgeon to the Wigan Royal Infirmary.

Note.—Since writing the above the diagnosis of abdominal tuberculosis in the second case has been confirmed by laparotomy.

Wigan.

THE WASSERMANN REACTION IN MALARIA.

BY WILLIAM FLETCHER, M.D. CANTAB.,
PATHOLOGIST, THE INSTITUTE FOR MEDICAL RESEARCH, KUALA LUMPUR, FEDERATED MALAY STATES.

IT has been stated by many observers that the presence of malaria parasites in the blood gives rise to a positive Wassermann reaction. Meier and Bonfiglio[1] in Italy found that malarial patients gave the reaction as long as they had malarial parasites in the blood. Boehm[2] examined 46 cases and obtained a positive result in 16. De Haan[3] in Java examined 163 cases, of which 63 were positive. At the annual meeting of the British Medical Association held in 1910, Professor Wassermann gave as his opinion that "one should employ the reaction with people who have been in the tropics and contracted malaria, only when one is convinced, by their history, that they have had no malarial attack during the last quarter of a year."

In the majority of the cases which are examined here, in the Federated Malay States, it is impossible to make sure that the patients have been free from malaria for a period of three months. This investigation has been undertaken, therefore, in order to determine to what extent malarial infections influence the results of the Wassermann reaction as practised in this institute. With this object 50 cases of malaria have been examined; 20 of these were subtertian, 17 simple tertian, and 13 quartan. In every case malarial parasites were present in the blood at the time it was collected. All the 20 subtertian cases gave negative results except three. One of these three had a scar on his penis due to a chancre from which he had suffered six years before. The other two subjects who gave a positive reaction were not examined for syphilis when their blood was taken and they left the hospital on the following day before their cases were investigated. All the 17 simple tertian cases were negative except one, who had suffered from syphilis three years before. All the

[2] Centralblatt, Band xliii., p. 651.
[3] Archiv für Schiffs- und Tropen-Hygiene, Band xvii., p. 693.

13 quartan cases were negative except one patient, who was covered with scars due to an attack of syphilis seven years before. In short, all the 50 patients with malarial parasites present in the blood gave a negative Wassermann reaction except five, and in all of these five cases which could be investigated there was clear proof of a former attack of syphilis. In the examination of these malarial sera seven cases of active syphilis were employed as controls, four of them were in the secondary and three in the tertiary stage of the disease. Each of them gave a well-marked positive reaction. All the patients were Asiatics; 29 of them were Chinese, 18 were Tamils, 2 were Sikhs, and 1 was a Malayalum.

As it was considered possible that the intensity of the infection might influence the reaction, in each case a rough estimate was made of the number of parasites by counting the fields examined and the number of parasites seen. In ten of the cases there was an average of two or more parasites in each field. In four instances the average was more than nine. On the other hand, cases were also examined in which there was only a small infection: in one as many as 159 fields were searched before a parasite was encountered. It was found, however, that the presence of malarial parasites, whether in small or large numbers, did not cause a positive reaction.

In all the foregoing cases the serum was inactivated by being heated for 30 minutes at a temperature of 55° C. before the Wassermann test was carried out. But in 20 of them, before the serum was inactivated, it was divided into two portions, one of which was tested while fresh and active, while the other portion was heated before being used. With the heated serum the reaction was negative in all the 20 cases except one who was syphilitic. With the fresh serum, on the other hand, there was a weak positive reaction in 4 cases (two to four doses of complement deviated) and a doubtful reaction in 3 (incomplete lysis); the syphilitic case was, of course, positive. It is evident, therefore, that the results, when the serum is fresh, are different from those obtained when it has been inactivated by heat. No doubt the use of fresh serum has been responsible for some of the positive results which various observers have obtained in cases of malaria; but probably the chief cause of confusion lies in the loose way in which the term "Wassermann reaction" is now employed. It is used not only to denote the test as originally carried out by its author, but is also applied to the very numerous modifications which have arisen. This confusion would be obviated to a great extent if serologists would give details of the technique which they have employed.

The method employed here was that of Browning, Cruickshank, and McKenzie, the distinguishing feature of which is the use of two antigenic extracts: one of ox-liver lecithin, and another consisting of a mixture of lecithin and cholesterin. The authors of this modification found that, in the ordinary methods of carrying out the test, a normal serum in the presence of an emulsion of organ extract may absorb more complement than the sum of the amounts absorbed by the serum and the emulsion separately, so that in such cases the reaction is apparently positive. They overcame this difficulty by the employment of the two antigens mentioned above, and they found that "if a serum absorbs more complement in the presence of lecithin plus cholesterin than it absorbs in the presence of lecithin alone, then this is evidence of its syphilitic nature."[4]

Browning, Cruickshank, and McKenzie employed an anti-ox-hæmolytic system. The use of this system entails the previous saturation of the guinea-pig serum with ox corpuscles and centrifugalisation at 0° C. in order to remove the natural amboceptor which may be present. In order to obviate this difficulty the hæmolytic system employed here was that in which human corpuscles are sensitised with the homologous immune serum from the rabbit.

Conclusion.—The presence of malarial parasites in the blood does not cause the serum to give a positive Wassermann reaction when the method of Browning, Cruickshank, and McKenzie is employed.

Kuala Lumpur.

ON THE EFFECT OF GASTRIC AND PANCREATIC FERMENTS ON THE POTENCY OF TINCTURE OF DIGITALIS.

BY ALEXANDER GOODALL, M.D. EDIN., F.R.C.P. EDIN.,
ASSISTANT PHYSICIAN TO THE EDINBURGH ROYAL INFIRMARY;
AND
H. S. REID, M.D. EDIN., F.R.C.S. EDIN.,
DEMONSTRATOR OF PHYSIOLOGY, SURGEONS' HALL, EDINBURGH.
(*From the Physiological Laboratory, Surgeons' Hall, Edinburgh.*)

FEW drugs are subjected to so much criticism as the tincture of digitalis. This is doubtless due to two reasons. In the first place samples vary in their potency, and unless they have been subjected to physiological tests the variation is first manifested when the drug is administered to a patient. In the second place samples of digitalis cannot be relied upon to retain their full potency longer than one year.

It has occurred to us that another possible factor in bringing about uncertainty of action might be the effect of the digestive juices. We therefore undertook the following investigations. The minimum lethal dose of samples of tincture of digitalis to frogs was ascertained. Each sample was then kept in contact with a digestive ferment at body temperature for six hours and the minimum lethal dose was again determined.

Experiments with Pepsin.

Six samples were tested. 10 c.c. of a tincture whose minimum lethal dose had been determined were incubated at 37° C. for six hours along with about 5 gr. of pepsin (Duncan Flockhart and Co.) and 1 c.c. of hydrochloric acid 0·2 per cent. At the same time a piece of fibrin which had been coloured with carmine and well washed was placed in connexion with pepsin and acid in similar dilution in order to have check observations on the activity of the ferment. After six hours it was found that the tinctures had lost bulk owing to the evaporation of spirit. The bulk was made up to 20 c.c. with water and the minimum lethal dose was again tested. This dilution was of course allowed for in making the experiments. Of 6 samples tested it was found that 4 retained their full potency. In

---

[4] Recent Methods in the Diagnosis and Treatment of Syphilis, Browning and McKenzie, p. 37.

2 cases there was a loss of potency which did not exceed 30 per cent. The loss may have been less, but finer graduations were not investigated.

Experiments with "Pancreatin."

Six samples were tested in the same way. 10 c.c. of the tincture was put up with 5 gr. of "pancreatin" (D.F. and Co.) and 1 c.c. of sodium carbonate 1 per cent. This was a much more powerful ferment than the pepsin, as the fibrin was always completely digested at the end of six hours. Of the 6 samples tested it was found that 2 retained their full potency, 2 had lost potency to an extent not exceeding 30 per cent., and 2 had lost potency to an extent not exceeding 50 per cent.

It is thus apparent that the effect of pepsin in large quantity on the tincture of digitalis is comparatively slight. The effect of the pancreatic trypsin may be considerable, but it is doubtful whether tincture of digitalis given by the mouth ever comes much in contact with it. It may be concluded that as tincture of digitalis is never likely to be subjected to such a severe digestive ordeal under the conditions in which it is administered therapeutically there is little likelihood of any loss of potency before it is absorbed.

Protocols of Experiments.

TRAUMATIC EXFOLIATIVE KERATITIS.

By PHILIP A. HARRY, M.D. Edin., D.P.H. Edin.,

HONORARY OPHTHALMIC SURGEON, ROCHDALE INFIRMARY.

Traumatic exfoliative keratitis is a comparatively rare condition, met with chiefly in adult males and characterised by severe neuralgic pains, lacrymation, photophobia, and a tendency to periodical relapses. A history of traumatism is invariably present, and the patient is always able to give the exact date; as a rule the injury is trifling and apparently insignificant, and but for his certainty that the whole trouble commenced at the time stated one would be inclined to belittle or ignore altogether the history of injury. During the past 12 months six cases have come under my observation; in this series the traumatisms have been produced by such trivial things as a child's finger-nail, the sharp end of a piece of straw, the edge of a lady's hat, a projecting hatpin, the point of a dried leaf, and a crust of bread. The patients were all seen in private, and were found to be thin, poorly nourished, and neurotic or arthritic in type.

The symptoms are definite and clearly stated: one morning when the patient awakes, simultaneously with the opening of his eyes, he experiences a sharp stab, as if a needle had been pushed through the eye. Touching or rubbing the eye or any subsequent attempt to separate the lids causes a repetition of the same pain. Relief is only obtained when he buries his head face downwards in the pillow or makes firm pressure on the globe with his fingers. The eyeball is red and vision slightly defective; with or without treatment the attack lessens in severity, and the eye returns apparently to normal in a few days. In four to six weeks, just as the patient is about to forget the previous attack, a recurrence takes place; it is usually a complete surprise to him, there is no warning, nor can he remember any indiscretion on the previous night to account for it. The second and third attacks are never as severe as the first; subsequent ones may, however, be quite as bad as the second or third. Relapses take place with more or less regularity every four to six weeks. The following case sent up by Dr. L. Kilroe, of Sudden, is typical of the series.

A man, aged 30, came complaining of periodical neuralgic pains in the right eye. Three years ago he was struck in that eye by a crust of bread; the blow was aimed from the right side. He suffered little or no pain at the time, but since then at intervals of about six weeks he has had relapses of the character above mentioned. He has been treated by his medical man with fomentations, protargol drops, lotions, &c. The severity of the attacks has diminished.

Examination during an attack shows a very sensitive eye, the patient is nervous, irritable, resents any interference, and a thorough inspection is exceedingly difficult. He gets some relief if the upper lid is kept off the globe, but as soon as the tears evaporate the epithelium dries and the pain returns. There is rarely any general headache; there may be pain on pressure over the supraorbital as its emerges from its foramen; as a rule the painful symptoms are entirely confined to the eye. Photophobia and lacrymation are marked, ciliary congestion is present, tension is normal or slightly *minus*. If the patient can make any attempt to read the test types it is found that his vision is considerably reduced. Examination of the cornea with the binocular loupe or the corneal microscope shows an intact surface with a milky appearance at one spot. Staining with fluorescin produces a negative result. With the ophthalmoscope the milky area is recognised as an irregular shadow with diminished transparency.

Examination during an interval of attacks shows a clear cornea, and occasionally a small yet definite depression at the seat of injury; this is difficult to demonstrate and is only noticeable in certain positions of the light. There is always some ciliary congestion in that part of the limbus nearest the depression. In no case was vesical formation noticed, either during or after an attack; the only corneal defects are the milky opacity during, and the minute depression or crack in the epithelium after, an attack. The sensitiveness of the cornea is not diminished.

In the condition under discussion the attachment of the epithelium to Bowman's membrane is exceedingly loose; if the upper layer of the cornea is touched with a cotton-tipped probe it slides from Bowman's membrane like a cloth off a well-polished table. The same thing is said to occur after death, but the examination of several corneæ in the post-mortem room has failed to confirm this statement. The epithelial layer crinkles or ruffles and comes away in patches, but there is no exfoliation. In the normal healthy individual it is not possible to separate the two superficial layers of the cornea. If an attempt is made to remove the epithelium it comes away only from the area that is being scraped.

In traumatic exfoliative keratitis the superficial layer separates with the greatest ease in the immediate vicinity of the original abrasion, and the separation can be continued up to about 3 mm. from the corneo-scleral junction. Beyond this point it is practically impossible to go, and if the attempt is made bleeding soon takes place. A similar condition occurs in old people after operations on the cornea; the exfoliation, however, extends only a short distance from the wound, and a definite keratitis develops sooner or later. The diagnosis must be made from several corneal diseases and dystrophies.

Herpes febrilis corneæ occurs in febrile diseases, especially influenza, pneumonia, measles, and is associated with an eruption of vesicles on the cornea. Herpes zoster corneæ is also associated with an eruption of vesicles, but is distinguished from the above by running a considerably severer course. Keratitis vesiculosa or bullosa occurs in blind diseased eyes.

In an article on this subject[1] Dr. J. A. Menzies (until recently honorary ophthalmic surgeon at the Rochdale General Infirmary) discusses the etiology and treatment and gives a list of references. The theory that gains the most supporters holds that the new epithelium formed after the abrasion is not firmly enough attached to the subjacent tissue, and so becomes detached easily; the inequalities of the corneal epithelium become interlocked with corresponding inequalities on the tarsal surface; when the eye is suddenly opened, especially after a prolonged sleep, the lid pulls on the corneal epithelium, raising it in the form of a blister and drags upon the nerve filaments so as to cause pain. This theory does not explain the spread of the exfoliation from the injured area almost to the limbus, nor the fact that such separation does not occur in xerotic conditions of the cornea. Several other theories are mentioned, such as the retention of a minute foreign body, transudation of lymph under the epithelium forming a traumatic keratitis bullosa.

A far more likely theory is the manufacture, at the site of the erosion, of a toxin, which although unable to penetrate Bowman's membrane can spread along its surface, producing exfoliation up to a certain point. The exfoliated layer, floated out on a slide and examined under the microscope, shows among other changes a granular degeneration of the intracellular spaces, most marked near the seat of injury. At the centre of this area the disintegration progresses to actual loss of substance; this corresponds to the depression that is produced in the middle of the milky looking area.

In all these cases the abrasion of the cornea was produced tangentially to the surface, and it is more than probable that under the flap thus formed organisms were introduced, and the quickly healing epithelium left them embedded. The toxins they produce give rise to the exfoliation, and the changes in the epithelial cells at this spot cause loss of lustre and transparency. When these changes have progressed for some time, as during sleep, the friction produced by opening the lids will ruffle the epithelium and cause the symptoms complained of. The successful treatment of the cases under observation has been based on this theory.

The treatment usually recommended consists of bandaging the affected or both eyes, the introduction of neutral fatty substances, and the instillation of cocaine or other drops. The relief obtained from this is only temporary. More permanent relief is obtained by touching the eroded spot with some form of caustic—for example, silver nitrate, carbolic acid, iodine, or formalin; but the results are not always certain. The same remark applies to the use of the curette before cauterising, while in more than one case opacities have been noticed after this method of treatment.

In my series of cases the following was the line of treatment carried out. The conjunctival sac is rendered anæsthetic and carefully douched with normal saline solution. By means of a Bowman's discission needle several oblique punctures are made into the anterior chamber at and around the seat of the trauma; on each occasion before withdrawing the needle it is turned at right angles on itself to allow the antibody-containing aqueous to escape slowly. As a rule the epithelium is raised from Bowman's membrane by the fluid. This, together with the use of weak peroxide of hydrogen lotion and 2 per cent. chloretone in parolene drops, is sufficient to produce a cure and prevent relapses.

Rochdale.

SIXTH INTERNATIONAL DENTAL CONGRESS.—As already announced in our issue of Feb. 14th, p. 505, in fuller detail, the Sixth International Dental Congress, the first ever held in this country, will take place at the University of London and the Imperial College of Science and Technology, South Kensington, from August 3rd to 8th, under the presidency of Mr. J. Howard Mummery. His Majesty the King is patron of the Congress, which will be attended by distinguished representatives of the dental profession from the leading countries of the world, and which is under the official recognition of the Governments of this and other countries. Application for membership should be made to the general secretaries, 19, Hanover-square, London, W., enclosing the amount of subscription, namely, 30s. for personal membership, and 15s. for any member of the family who may wish to attend as a visitor.

Medical Societies.

ROYAL SOCIETY OF MEDICINE.

SECTION OF LARYNGOLOGY.

Exhibition of Cases and Specimens.

A MEETING of this section was held on May 27th, Dr. D. R. PATERSON, the President, being in the chair.

Professor GUSTAV KILLIAN (Berlin) gave a demonstration of Suspension Laryngoscopy on Living Subjects.

The following were the exhibits :—

Mr. E. B. WAGGETT: Epithelioma of the maxillary antrum and hard palate three years after operation (microscopic specimen exhibited). Sarcoma originating in the floor of the right maxillary antrum two years after operation (specimens exhibited). Endothelioma of the nose three weeks after operation.—Dr. HILL described a case of carcinoma of the upper jaw which was undergoing treatment by radium at the present time; four emanation tubes were inserted into different parts of the growth and left *in situ* for 48 hours.—The PRESIDENT expressed the opinion that radium should not take the place of operative treatment in those cases suitable for operation.—Mr. WAGGETT said that radium was not tried in the case of endothelioma because it was found possible to remove the growth freely by means of the knife. He suggested that the pulsation in certain tumours was due to the manner in which the blood-supply entered the tumour through a constriction near its base.

Mr. HERBERT TILLEY: 1. Case of Laryngo-fissure for Epithelioma of the Vocal Cord nine years after operation.—Sir FELIX SEMON expressed his pleasure at seeing a case do so well without the severe operation of total removal of the larynx.——2. Specimen of Vascular Fibromata removed from larynx by the indirect method since the last meeting of the section. Mr. Tilley stated that the indirect method was not yet superseded by the direct.—Professor KILLIAN said that he still removed a large proportion of his laryngeal growths by the indirect method.—Sir FELIX SEMON thought the younger generation of laryngologists might practise the indirect method with profit; those cases which were most difficult to manage by the direct—e.g., those growths in the anterior commissure—were most easy by the indirect.—Sir STCLAIR THOMSON thought that both methods had their special indications.—Dr. DUNDAS GRANT said that with small children the suspension method with a general anæsthesia was ideal.——3. Case which illustrates the successful endonasal treatment of Unilateral Pansinusitis.—In connexion with this case Dr. GOLDSMITH (Canada) showed a specimen of Canadian Indian skull which showed absence or obliteration of both frontal sinuses.—With reference to Dr. Goldsmith's specimen, Dr. JAMES DONELAN suggested that he would like to know something of the history of the case which might suggest a reason for the absence of the sinuses.—Dr. GOLDSMITH said in reply that the case had died 500 years ago.——4. Two curettes for the removal of the anterior ethmoidal and "agger" cells. 5. A collection of Foreign Bodies removed from the Lower Air Passages and Œsophagus. 6. Skiagrams illustrating Foreign Bodies in the Bronchi and Malignant Strictures of Œsophagus.

Mr. E. D. DAVIS: 1. Specimens obtained from a case of Laryngo-fissure for Epithelioma of the Right Vocal Cord. 2. A case of Gummatous Ulceration of the Larynx. 3. A case of Gummatous Perichondritis. 4. A case of Advanced Laryngeal Tuberculosis treated by tracheotomy and curetting. Mr Davis stated that curettage was performed with the hope of leaving out the tracheotomy tube, but that this was not found possible.

Dr DAN MCKENZIE: 1. ? Malignant Disease of Larynx. Dr. McKenzie stated that since sending in notes of this case it had been proved to be tuberculous. 2. ? Tertiary Infiltration of the Larynx simulating Malignant Disease.—Dr. DUNDAS GRANT was of the opinion that the case was syphilitic.—Dr. MCKENZIE said that the pathological report was doubtful.——3 Piece of bone removed from a larynx by suspension laryngoscopy.

Mr. W. STUART-LOW: 1. Osteomyelitis of the Superior Maxillary Bone and Maxillary Antral Suppuration in a child aged 11 months at the time of operation.—Dr. A. BROWN KELLY thought that the infection probably originated in a dental sac and then infected the bone.——2. A girl, aged 5, from whose naso-pharynx a large Spindle-celled Sarcoma was removed six weeks ago.—Dr. DUNDAS GRANT recalled a number of such cases which were wrongly diagnosed as "adenoids."

Mr. W. M. MOLLISON: 1. Case of Carcinoma of Maxillary Antrum; operation and removal of glands.—The PRESIDENT congratulated Mr. Mollison upon the result, and the latter, in reply, mentioned that the operation was made easy by the administration of ether by the intratracheal method.——2. Hyperostosis of Superior Maxilla.

Dr. DONELAN: 1. Case of Paralysis of both Superior Laryngeal Nerves occurring in the course of disseminated sclerosis from lead poisoning. 2. Instruments for the submucous resection of the nasal septum.

Mr. WALTER G. HOWARTH: Carcinoma of Aryteno-epiglottic Fold and Pyriform Fossa removed by transthyroid pharyngotomy.

Mr. W. DOUGLAS HARMER: Chondro-sarcoma of Pharynx 12 days after diathermy.

Dr. DUNDAS GRANT: A case of ? Rhinoscleroma.

EDINBURGH MEDICO-CHIRURGICAL SOCIETY.

Jackson's Membrane and the Genito-mesenteric Fold of Peritoneum.—Intratracheal Insufflation of Ether.

A MEETING of this society was held on June 3rd, Dr. JOHN PLAYFAIR, the President, being in the chair.

Mr. DOUGLAS G. REID (Cambridge) read a paper on Jackson's Membrane and the Genito-mesenteric Fold of Peritoneum. In relation to C. H. Mayo's suggestion regarding the congenital origin of Jackson's membrane, he showed how the cæcum might actually come to lie in a pocket formed by the genito-mesenteric fold displaced to the right, off the line of the spermatic or ovarian vessels. This displacement was a result of pressure exerted upon the fold by the pelvic colon. He exhibited photographs of fœtuses and adults which showed clearly that strong and extensive pre-colic membranes, in relation to the cæcum, ascending, descending, and iliac colons, might be formed by appendices epiploicæ. These might constrict the bowel to a remarkable degree. The expansion of the narrow descending colon would be prevented or hampered. He considered the other ways in which pre-colic membranes might arise apart from pathological causes. The genito-mesenteric fold of peritoneum which he had described occurred in 55 per cent. of 20 fœtuses, 70 per cent. of 10 children at birth, and 33 per cent. of 18 adults. The fold was a track along which infection or inflammation might spread from the bowel (appendix, ileum, cæcum) to the ovary (or ovaries) and Fallopian tube or in the opposite direction. In this connexion it was noteworthy that appendicitis was quite common in children. He demonstrated close connexions between the bowel (ileum, appendix) and the right ovary and Fallopian tube by means of the fold. He showed how intestinal flexures might become acute during fœtal life by movements which approximate the limbs of the loops. It was important to distinguish between flexures of the bowel which were permanent and those which had no claim to be regarded as other than temporary. He showed how flexures of the ileum, appendix, and ascending colon might become permanent through adhesion of the bowel to the right surface of the genito-mesenteric fold. He demonstrated mechanical causes of peritoneal adhesions. Photographs were exhibited which showed clearly that the pelvic colon, through the pressure which it exerted on neighbouring parts, was an important cause of adhesions. It was capable of producing all the adhesions which the surgeon might encounter in the ileo-cæcal region. This action of the pelvic colon partly explained how the genito-mesenteric fold was not so common in the adult as in the fœtus and child at birth. The genito-mesenteric fold was another important cause of adhesions. Through anchoring, or indeed exerting traction upon the peritoneum it could even lower the root of the mesentery before the descent of the cæcum. The fold might cause abnormal downward displacements of the root of the mesentery, duodenum, cæcum, and ileum. "Cohesion" might be a better term than "adhesion." These "cohesions" formed ready-made barriers resisting the spread of inflammation. They were not due to pathological causes. The genito-mesenteric fold also explained retro-colic and other positions of the appendix, retro-colic abscess, &c. Photographs of various peritoneal folds and fossæ were shown. Development occurred during fœtal life of the hepato-colic (cysto-colic) ligament, and of adhesions involving the posterior surface of the stomach, great omentum, &c. The firm resistance of the relatively enormous liver of the fœtus must be taken into consideration in accounting for these adhesions. Other points were considered and were all illustrated with photographs of actual specimens, fœtal and adult. —In the discussion which followed Mr. C. W. CATHCART said that he was glad to know that many of the folds met with were anatomical and not pathological in nature. He was of opinion that adhesions could not be the only reason for the pathological changes which followed, and he thought that the action of peristalsis must be a great contributory cause. It was well-known that the intestines might be buried in adhesions and yet no obstruction was present. Unless there was a failure in peristalsis obstruction did not occur.—Mr. D. P. D. WILKIE said that the folds which Mr. Reid had demonstrated were often what they were in the habit of calling pathological. There were three kinds of folds: (1) parieto-colic folds of developmental origin; (2) folds which were obviously of inflammatory origin were undoubtedly found; and (3) folds which resulted from thickening of the peritoneum and mesentery with adhesions.—Dr. D. CHALMERS WATSON said that he felt somewhat sceptical as to whether many of these adhesions or folds were really anatomical or developmental in character.—Mr. A. SCOT SKIRVING asked if Mr. Reid considered the genito-mesenteric fold were entirely of developmental origin or not; and if so, why did it occur only in 33 per cent. of adults.—Mr. LEWIS BEESLY agreed with Mr. Reid as to the anatomical origin of these folds. They were found in living bodies but not in dead bodies. In a great many children and adults these folds were very commonly met with during operation, and yet it was rare to meet with them in the dissecting room. Did these structures change after death? In the living body one could easily lift up the ascending or descending colon with their peritoneal coats, but if one tried to do this in the dead body the peritoneum would tear. He asked whether the appendices epiploicæ were not merely the remains of the gastro-colic omentum.—Mr. REID, in reply, said that the genito-mesenteric fold was not always present. The reason why it was not so commonly met with in the adult as in the fœtus was because of the pressure exerted on the fold by the pelvic colon, so causing adhesion. Again, the mesentery might fuse down to the genito-mesenteric fold, and so might obliterate it. Adhesions were undoubtedly formed by pressure; whenever a sheet of peritoneum was rendered immovable adhesions tended to form.

Dr. H. TORRANCE THOMSON and Mr. J. W. STRUTHERS contributed a paper entitled "Note on the Intratracheal Insufflation of Ether." Intratracheal insufflation consisted in driving a current of air under pressure through a tube introduced by way of the mouth and larynx deeply into the trachea. The current of air returned between the tube and the wall of the trachea and escaped through the mouth and nose. The current was continuous. The work of Meltzer and Auer had demonstrated that this insufflation of air into the trachea under adequate pressure ventilated the pulmonary alveoli and enabled the normal diffusion of gases to be carried out for many hours, independently of all respiratory movements. If the air in its passage under pressure were made to pass through a chamber containing ether they were enabled to introduce into the pulmonary alveoli ether vapour of varying strength. The points to which attention might be directed were as follows. 1. In ordinary respiration air had to be brought from outside through the nose, pharynx, larynx, trachea, and bronchi; from this point respiration consisted in an interchange of gases between the tidal and alveolar air by a process of diffusion. In intratracheal insufflation air was brought down to the bifurcation of the trachea with a certain force which favoured diffusion of gases, the long intervening air-shaft which had been termed the "dead space" being thus cut out. The practical importance of this was that there could be no interference with the free passage of air between the entrance to the mouth or nose and the trachea, an interference which was so frequently responsible for respiratory difficulties during anæsthesia. In addition, an excellent means for performing artificial respiration was always available. In their own experience at Leith Hospital the apparatus was used successfully in a patient who had attempted suicide by drowning and in whom respiratory movements had ceased. Artificial respiration was kept up for several hours by this apparatus, after which ordinary respiratory movements were re-established. 2. In intratracheal insufflation there was during the entire period a continuous current of air blowing forcefully from the trachea through the larynx, pharynx, nose, and mouth. It had been demonstrated in the laboratory and in actual practice that during insufflation it was impossible for blood, mucus, or vomited matter to enter the larynx, obviously a point of great practical importance in many operations. 3. By the constant maintenance of sufficient positive pressure collapse of the lungs might be prevented or regulated at will when the thorax was opened. In virtue of this, and because the method did not depend on the efficiency of the patient's respiratory movements, intratracheal insufflation of ether appeared likely to displace the elaborate negative and positive pressure cabinets and masks which had been devised for intrathoracic operations. The claims made on behalf of the method were based on the records of a large number of laboratory experiments carried out by Meltzer, Auer, and others, and on the observations of anæsthetists and surgeons in actual practice. Their experience was derived from the use of the method in about 100 cases. The cases were not specially selected, their object being to gain experience as quickly as possible and to acquire dexterity in the technique, so that special cases might have a fair trial. The series, however, included many cases which afforded opportunity to put the method to the test with regard to the special advantages claimed for it. To commence with, they used an apparatus made after the model described by Meltzer. It was inexpensive and efficient. For the greater number of operations they used the apparatus devised by Mr. Kelly, of Liverpool. This consisted of two parts, the first part being for the production of the air current; the second for the etherisation of the air. The electromotor actuated a rotatory blower which produced a current of air. The blower ran at the rate of from 50 to 1000 revolutions per minute. The ether apparatus consisted of an ether chamber, 12 cm. in diameter, metal lid, with entry and exit for air current, and a third opening for introduction of ether. The entry tube dipped down into the air space above ether for about 4 cm. Entry and exit tubes were interrupted by taps geared by cog-wheels to a third tap connecting both entry and exit. This permitted of variation in ether strength of air current from zero to full saturation. The preliminary administration of morphia 1/6 gr. and atropine 1/100 gr. had been the rule. In alcoholic subjects it would probably be an advantage to add scopolamine 1/100 gr. For the introduction of the catheter they used Hill's endoscope. The passage of the catheter was at first a matter of difficulty, but with practice it became comparatively easy. The important points to attend to were: (1) thorough relaxation before attempting intubation—the lower jaw should be so slack that a gag was not required; (2) the head should be hanging over the end of the table or in the occipito-shoulder position; (3) the epiglottis must be identified and the speculum passed sufficiently far below its tip that it will not slip (too deep insertion must be avoided); and (4) keep the speculum in the left hand and with a tilting movement of the hand lift the hyoid bone. The glottis then came into view and there should be no difficulty in inserting the catheter which should be made rigid by means of a probe. They used the silk-web white-enamelled cylindrical catheters. They stood boiling fairly well if care were taken not to leave them too long in the boiling water and if each catheter were wrapped in a piece of gauze so that it was not in contact with another catheter. The instrument was pushed nearly to the bifurcation of the trachea—a point in the adult about 26 cm. from the incisor teeth—the probe was withdrawn and connexion made with the air current. The size of the catheter varied with the build of the patient. In all but exceptional cases experience led them to believe that the maximum size should be 24 F., ranging downwards from this. Too large a catheter interfered with the return current of air. Occasionally the tube had been passed into the œsophagus; this occurred several times in the earlier cases. With care and adequate relaxation such a mistake should not occur, but the possibility of it should be kept in mind. If the patient had been properly anæsthetised and the tube introduced without delay any glottic spasm which supervened should rapidly pass off. The degree of concentration of the vapour should not be too high too commence with, or irritation resulted, evidenced by spasm and coughing. The pressure should vary according to the case, from 10 up to 30 mm. Hg. The safety valve should be so arranged as to make any pressure above this impossible. In the majority of cases the course of anæsthesia had been perfectly smooth and uneventful—the colour remained a rosy pink, the pulse good, and the respirations quiet and regular. There was a noticeable absence of strain of all kind, the condition resembling natural sleep rather than narcosis. As a rule the anæsthesia was light and easily controlled by turning the regulator either towards full ether or air, and at any moment the ether could be turned off altogether, the apparatus being at once converted into one for performing artificial respiration. It was undesirable that the respiratory movements should be abolished altogether—their presence indicated that the respiratory centre in the medulla was not being overdosed with ether. At the conclusion of the operation, before withdrawing the catheter, it was well to flush out the lungs with air so as to remove any ether vapour that was present. This was accomplished by turning the regulator to air for a few minutes. In a few cases, notably in big alcoholic subjects, difficulty had been experienced in securing a sufficiently deep anæsthesia with good relaxation. In two of the authors' cases the attempt had to be abandoned and anæsthesia maintained by other methods. The attempt in such cases to give a more concentrated vapour had in their experience led to coughing and spasm. Probably, as previously suggested, the addition of scopolamine to the preliminary dose of morphia and atropine would be advisable, and it was particularly important to produce a deep anæsthesia in such subjects before commencing insufflation. There had not been any case of sickness during the insufflation. With such a limited experience to draw upon it was difficult to speak with any assurance regarding the question of shock. The absence of strain and the perfect aeration should certainly help to lessen shock, and the general opinion appeared strongly to favour the view that it did so. In their series there was one case of bronchitis occurring after an operation for goitre. In a few cases there was some hoarseness and complaint of sore throat, more marked in the early cases and possibly due more to clumsy introduction than to irritation from the intratracheal tube. There had been no case of pneumonia. After-sickness occurred in a certain proportion of the cases. It was generally held by those who had experience of the method that the amount of after-sickness was less than after ordinary inhalation anæsthesia. In estimating the value of this method it was in the first place to be remembered that it was essentially a method of maintaining anæsthesia; it did not touch the problem of satisfactory induction. The general conclusions to which one came might be briefly summarised. Provided a satisfactory apparatus was used and reasonable precautions were taken the method was a very safe one. The precautions referred to were concerned with such points as the skilful introduction of a properly-sized tube, the regulation of the pressure, and the maintenance of respiratory movement. In prolonged operations the method provided a quiet, even anæsthesia, with perfect aeration and marked absence of all strain. One was struck by the peaceful nature of the anæsthesia, the condition, as previously remarked, resembling a natural sleep rather than a narcosis. In abdominal operations the quiet respiration and the relaxation of the muscles of the abdominal walls made the method a very satisfactory one, especially in operations on the upper part of the abdomen. It promised to relieve the respiratory embarrassment which was sometimes seen during the course of anæsthesia in stout patients who were placed in the Trendelenburg position. In all operations about the mouth, such as those for excision of the upper jaw, antrum operations, or those undertaken for removal of naso-pharyngeal growths, any danger of aspiration of blood, mucus, &c., was removed, and the anæsthetist was well out of the surgeon's way. There was no interruption to the regular delivery of ether vapour, which was so liable to occur in such cases with ordinary methods. In operations for removal of glands in the neck or for mastoid disease the surgeon had the field to himself and was not hampered, nor was his asepsis endangered by the proximity of the anæsthetist's mask. In such operations as laminectomy and nephrectomy the postural difficulties with which the anæsthetist had to contend and which also tended to interfere with free respiration were eliminated. They had unfortunately not had the opportunity of testing the method in thoracic surgery. The opinion had been expressed that it would supersede the positive and negative pressure cabinets and greatly extend the possibilities of intrathoracic operations. In conclusion, while anxious to avoid making extravagant claims, they suggested that in intratracheal insufflation of ether they had a very safe method of maintaining anæsthesia which in properly selected cases offered great advantages, and that the method deserved to take its place alongside of other methods at the disposal of the anæsthetist.—The paper was discussed by Dr. J. S. ROSS, Dr. T. M. BURN-MURDOCH, Professor F. M. CAIRD, Dr. O. C. BRADLEY, and by Mr. A. A. SCOT SKIRVING.—The authors briefly replied.

ROYAL ACADEMY OF MEDICINE IN IRELAND.

SECTION OF OBSTETRICS.

Exhibition of Specimens.—Report of the Rotunda Hospital.

A MEETING of this section was held on May 22nd, Dr. M. J. GIBSON, the President, being in the chair.

Dr. H. JELLETT showed a Uterus removed for concealed accidental hæmorrhage from a patient aged 25 years. This was her sixth pregnancy. The previous history was one abortion, one premature, and three full term, all with normal labours. On the day of admission she had some hæmorrhage, and was plugged by a medical man before being sent into hospital. When admitted she looked fairly well, with a pulse of 104. The plugs were removed, and as there was no subsequent hæmorrhage the patient was left alone. After three hours a little blood came from the vagina, and the patient was emphatic that the uterus had got much larger. It was then nearly up to the ensiform cartilage. She was extremely anæmic and appeared not to be able to stand any loss of blood. Examination showed the membranes presenting through the cervix, and as the conclusion had been formed that the patient could not afford further loss of blood and was suffering from concealed accidental hæmorrhage the abdomen was opened and the uterus removed. Everything went on satisfactorily afterwards. Examination of the specimen showed that the diagnosis was right.—Sir WILLIAM SMYLY said that the specimen was, so far as he knew, unique, and suggested that it ought to be put up in a permanent form. He had no doubt that the treatment described was correct. He agreed that uterine hæmorrhage could always be stopped by removing that organ, and thought it was perfectly right to do so if the hæmorrhage could not be stopped in any other way.—Mr. SPENCER SHEILL said the operative treatment was undoubtedly correct. In spite of the blood pressure at the site of the blood clot the wall was thicker there than on the other side, and he therefore suggested that although the treatment carried out was the correct one plugging might also have been satisfactory.—The PRESIDENT referred to his experience in five cases of severe concealed accidental hæmorrhage. In every case a certain amount of blood had escaped externally, the uterus had increased in size, was hard and tender, and the patients' condition could not be accounted for by the amount of blood lost externally, nor by any other acute abdominal attack. He considered that the hæmorrhage in these cases could not be controlled either ante-partum or post-partum except by hysterectomy. When such a rapidly over-distended uterus was emptied, post-partum hæmorrhage led to the death of the patient.

Mr. SHEILL showed a specimen of Tuberculous Tubes removed from a patient who was married five years, had no pregnancy, and enjoyed fair health. She developed symptoms of endometritis, and curettage was carried out by a medical man with no good result. When Mr. Sheill was consulted he diagnosed tumour and recommended immediate operation. The two specimens shown were removed, one consisting of the right tube and ovary and the other of the right tube only. He spared the second ovary, with the intention of suturing it to the cornu of the uterus, but it was found adherent to the back of the uterus, and he was obliged to leave it. A point of interest was that the patient's sister consulted him seven years ago, and he diagnosed tuberculous tubes, and advised operation, which was refused, and she died from consumption two years ago.—Dr. GIBBON FITZGIBBON said that he did not altogether agree with Mr. Sheill's method of treatment of tuberculous tubes. In a somewhat similar case he cleared out the pelvis, taking tubes, ovaries, and uterus, as he did not see how one could expect the tuberculous disease to be restricted to the tubes alone. He considered it better for the patient to clear out the uterus in order to avoid the risk of leaving tuberculous infection in the uterus. He was reluctant to try conservative operations in tuberculous disease of the tubes where it was so extensive as in the specimen shown.—Sir WILLIAM SMYLY said he agreed with Mr. Sheill in leaving the ovary. Pelvic tuberculosis, he believed, had never been proved to be primary. It was looked upon by the best pathologists to be always secondary, and at the meeting of the German Gynæcological Association in Munich it was positively stated by the reporters that such a thing as a primary pelvic tuberculosis had never been met with—i.e., if a thorough examination of the patient's body was made one would certainly find tuberculosis in some other part. He did not, therefore, think that by taking out the tubes the patient would be prevented from getting pulmonary tuberculosis. The removal of the tubes when full of pus was absolutely necessary for the health of the patient, but he did not consider it necessary to remove the uterus, ovaries, or other organs. The direction in which the infection spread was always downwards, and it never extended along the mucous membrane upwards, but always in the direction of the stream. It was therefore an infection from the blood and not from the air. —Dr. JELLETT agreed with Mr. Sheill as regards saving the ovaries, but at the same time he considered pelvic tuberculosis was most dangerous. Within the last six months he had seen a great deal of pelvic tuberculosis. If operated upon it offered a good prospect of cure, but when not operated upon it led to serious results. In a case on which he had operated recently the patient had no symptoms, but had a very large necrotic mass lying in Douglas's pouch behind the uterus with complete destruction of the appendages.—Dr. R. J. ROWLETTE said that they were not in a position to judge what proportion of cases of tuberculosis of the genital organs became dangerous, and from the results of post-mortem examinations the question seemed to be similar to that of tuberculosis of the lungs. It might be concluded regarding pelvic tuberculosis as with pulmonary that a very considerable proportion of cases got better without treatment, but it was true that the disease in a certain number of cases became dangerous to life. Referring to treatment, it was not the custom to try to eradicate the disease by the knife in other parts of the body, and he did not see why this should be attempted in the pelvis. It was almost certain that when tuberculosis was found in one part of the body it was also present in another. He could not agree that in a case of pelvic tuberculosis one would be justified in clearing out all the pelvic organs, and even if it were necessary to remove the uterus it would scarcely be necessary to remove the ovaries, as it was rarely found that any traces of tuberculosis existed upon the surface of the ovary.—The PRESIDENT said that pelvic tuberculosis was a disease which generally tended to become cured. Examination of a considerable number of tubes which he had removed showed that the great majority were inactive. In cases of tuberculosis of the endometrium he had advised sanatorium treatment with good results. If he were called upon to treat a patient with tuberculous tubes and decided on operation he would not remove more than the tubes if possible.

Dr. JELLETT, in introducing the Clinical Report of the Rotunda Hospital for the year ending Oct. 31st, 1913, said that during the year 2124 patients were delivered under the care of the hospital in its extern department and 2311 patients were admitted to the maternity wards. Of the latter number 299, who were not in labour, were discharged undelivered and 2012 were delivered. Thus, a total of 4136 labours in all were attended by the hospital staff. The principal event of the year was the complete renovation and rebuilding of the students' residence. The result was a most comfortable and commodious residence. There were 12 cases of unavoidable hæmorrhage and 24 cases of contracted pelvis during the year. There were 13 cases of prolapse and presentation of the cord. There were only 5 cases of eclampsia during the year. The forceps were applied in 64 cases. Cæsarean section was performed seven times, in every case the indication being contracted pelvis; in 3 cases it was performed for the second time, and in 1 case for the third time. The morbidity rate of the hospital, as estimated by the standard of the British Medical Association, was 1 in 16·45. The assistants had tested systematically and carefully the action of pituitary extract on the uterine contractions. During the year 585 patients were admitted to the gynæcological department, 463 operations were performed, and the total mortality was 8—i.e., 1·73 per cent. In 40 cases hysterectomy was performed, with 38 recoveries. This number included 6 cases of Wertheim's radical hysterectomy. In 31 cases abdominal myomectomy was performed, with 1 death. Twenty-five operations were performed for genital prolapse.

SOCIETY OF MEDICAL OFFICERS OF HEALTH.—The annual provincial meeting of this society was held in Glasgow on May 30th, Dr. A. K. Chalmers, the President, being in the chair.—Professor Matthew Hay opened a discussion on Public Health Research. After referring to the great advances which had been made in medicine during the last half century, he dealt with those more particularly connected with hygiene. The world was now realising as never before how much humanity owed to those advances, and the British Government had begun in recent years to take some real interest in medical science. Following upon certain grants for important special researches, such as those conducted by the commissions or committees on tuberculosis and certain occupational diseases and tropical diseases, it had recently done a wise act in providing some £60,000 for the encouragement and assistance of medical research. Comparatively it was not a large amount, but it was a substantial contribution, and there was some reason to hope that it might increase in future if the work accomplished justified the expenditure. The grant would not be devoted exclusively to investigations in tuberculosis, for an endeavour would be made to assist all kinds of research, whether in curative or preventive medicine. He referred with satisfaction to the proposal of the Government to devote a considerable sum to the provision and maintenance of laboratories for the assistance of medical practitioners in methods of diagnosis and treatment, and presumably also for the assistance of the public health service. One of the first things to be considered would be whether an effort should be made to utilise existing laboratories connected with teaching institutions or hospitals or whether the work was to be mainly or exclusively carried out in laboratories specially provided for the purpose. He was disposed to favour the view that as a rule the latter course should be adopted. It was essential that the laboratories wherever situated should have thoroughly skilled heads with adequate assistance, and a sufficiency of accommodation and equipment. Not only should routine work be carried out, but time should be given to research work bearing on the practical problems of health administration. For many years past the public health service had been attracting to its ranks a very large proportion of the best medical graduates. These men received in the course of their training for their Public Health degree or diploma considerable insight into laboratory work, and they would be keen on assisting to the full the resources of any laboratories with which their public health department might be associated. It was very desirable that statistical investigations should be more fully and more exactly employed in connexion with Public Health administration. It was very difficult for anyone to deal statistically with medical data unless he had a reasonably full knowledge of the value and qualification of such data and of their possible correlatives. Simple arithmetical methods were often sufficient to evolve from the data their more important lessons in the selection of the correlatives. The men in the thick of the actual work should be the most competent judges. Nevertheless, health officers would welcome the advice and assistance of expert statisticians, and it would be a great advantage if the services could be made available of the statistical department which the Medical Research Committee had decided to establish. There was little within the province of medical science that did not appeal to public health officers and might not have a bearing on the efficiency of health administration. Among problems which had yet to be solved were the causal organisms of some of the more common diseases, such as measles, scarlet fever, and small-pox, though such discoveries were not likely to fall to officers whose duties were so largely administrative, but there remained much regarding the apparent habits and modes of conveyance of infective organisms in general that they could materially assist in ascertaining. The vehicles and channels of infection still called for extended investigation and careful observation in the future. The views as to aerial infection had been revolutionised within the last 30 years. Once almost every zymotic disease was thought to be possible of conveyance through the atmosphere, and sanitary methods were framed accordingly. Now those who were more daring ventured to treat almost all kinds of cases together in a common ward, separated from each other only by a bit of tape. The investigations of the rôle of the insect both biting and non-biting still remained charged with potentialities. Professor Hay suggested that the Society of Medical Officers of Health might appropriately appoint a committee to consider the subject of research with a view to a feasible selection and to standardisation of methods of inquiry, as well as to the suitable local distribution of the inquiries.—Sir Shirley F. Murphy considered that Professor Hay had done a service to the public as well as to the society by insisting upon the need for exact research. He referred to the excellent work which Dr. Chalmers and his staff were doing in the investigation of the behaviour of pulmonary tuberculosis.—Dr. Helen MacMurchy (Toronto) expressed the hope that there would in future be paid much more attention to the investigation of the causes of infantile mortality.—Dr. W. Gemmell, Dr. T. F. Dewar, Dr. J. R. Currie, and the President also took part in the discussion.

BRADFORD MEDICO-CHIRURGICAL SOCIETY.—A meeting of this society was held at the Royal Infirmary on May 19th, Dr. J. F. Sykes, the President, being in the chair.—Dr. T. Jason Wood showed: (1) Solid Ovarian Tumour complicating Pregnancy; and (2) Foreign Body embedded at Root of Tongue.—Dr. A. Little exhibited Struychen's Direct Laryngoscope.—Dr. F. W. Eurich read a paper on Some Cases of Lead Poisoning. He said that he had recently come across an unusually large number of atypical cases of lead poisoning. None had been found in the city of Bradford, but many in the outlying districts, Clayton, Wibsey, Low Moor, Idle, Yeadon, Esholt, Shipley, and Queensbury, where the water-supply was not the same as in the centre of the city. In most of the cases there was no lead line, and abdominal pain was present. A boy aged 11 years showed paraplegia and anæmia; a laundry girl had unilateral wrist-drop; a man aged 40 had anæmia and a sudden attack of paraplegia followed by coma, optic neuritis, and, as frequently occurred, basophil granules in many of the red cells of his blood. Two cases had been mistaken for appendicitis. Dr. Eurich advised an inquiry into the water-supply, since in all cases he had found lead in the drinking water. Inquiry, he thought, should be made into the relation between this disease and rickets, and into all cases of optic neuritis, appendicitis, and abortion. He himself was conducting experiments along these lines, and would place them before the society at a later meeting.—Dr. J. J. Buchan suggested that the pressure in the high-level pipes might have some influence on the solution of lead.—The paper was discussed by the President, Dr. S. Lodge, Dr. A. Tomlinson, Dr. A. Bronner, and Dr. A. Manknell, and Dr. Eurich replied briefly.

A LONG MEDICAL APPOINTMENT.—At the last meeting of the Axbridge (Somerset) board of guardians Dr. Frederick St. John Kemm, medical officer for the Worle district, resigned after 30 years' service, and the guardians expressed high appreciation of his long and signally successful discharge of the duties and unfailing consideration of the poor.

Reviews and Notices of Books.

Diseases of the Heart.

By JOHN M. COWAN, D.Sc. Glasg., M.D. Cantab., F.R.F.P.S. Glasg., Professor of Medicine, Anderson's College Medical School; Physician, Royal Infirmary; Lecturer in Clinical Medicine in the University, Glasgow. With chapters on the Electro-Cardiograph, by W. T. RITCHIE, M.D. Edin., F.R.C.P. Edin.; and the Ocular Manifestations in Arterio-sclerosis, by ARTHUR J. BALLANTYNE, M.D. Glasg., F.R.F.P.S. Glasg. London: Edward Arnold. 1914. Pp. 438. Price 15*s.* net.

THE great advances which have been made in our knowledge of the diseases of the heart and arteries during the last ten years have necessitated a considerable review of the literature of the subject. Former treatises have had to be revised and many new works have been written. New methods of histological technique and the employment of the sphygmomanometer, the polygraph, and the electrocardiograph have elucidated many problems and yielded information of great value to the physician.

In the volume now before us Dr. Cowan has reviewed the subject of diseases of the heart in the light of recent investigations, and has presented to the practitioner the bearings of the results which have been obtained upon the practical work of diagnosis, prognosis, and treatment. Diseases of the myocardium are first considered, and a good account is given of the various forms of degeneration which may affect the cardiac muscle. Diseases of the arteries are next discussed, together with the symptoms which may manifest themselves. Caution of a practical nature is given as to the deductions to be derived from an estimation of blood pressure—namely, that this pressure rises to a considerable extent in the healthy individual from causes of a temporary and often trivial nature, the influence of which cannot always be accurately gauged; unless care be taken in studying all the aspects of each case fallacies may easily arise in distinguishing between a temporary physiological rise and a permanent morbid increase.

The chapter on nodal rhythm is rather involved and difficult to follow, but those on contractility and conductivity are well worthy of attention. It is pointed out that defective conduction is generally associated with gross lesions of the *a.-v.* bundle, but it is also admitted that there is some evidence which suggests that functional defect may exist without gross lesion of the bundle. In discussing the prognosis of heart-block Dr. Cowan expresses the opinion, which will meet with general support, that chronic full heart-block is not incompatible with many years of fair health, and that a partial block may become complete or may pass away.

The subjects of auricular flutter and auricular fibrillation receive due notice, and many electrocardiographic tracings are given in illustration of the letterpress; the symptomatology, diagnosis, and treatment of chronic valvular disease are considered at some length, and in the light of modern research. An account of the ocular manifestations in arteriosclerosis is contributed by Mr. A. J. Ballantyne, and Dr. W. T. Ritchie is responsible for a chapter on the electrocardiograph.

The work is admirably illustrated by diagrams and many well-executed drawings of morbid conditions of the heart. Physicians who are especially interested in the study of diseases of the heart will find much material of value in the book. The number of illustrative cases is one of the features of the work, and Dr. Cowan has evidently devoted much care and attention to the preparation of a learned treatise on cardiac disease.

Die Prognosenstellung bei der Lungentuberkulose.

Von D. O. KUTHY und A. WOLFF-EISNER. Berlin: Urban und Schwarzenberg. 1914. Pp. 672. With 21 illustrations. Price, paper, 18 marks.

THE difficulties attending the formation of a just prognosis in tuberculosis of the lungs are well illustrated by the great size of this German text-book devoted to that subject alone. In it are discussed over 400 various chief considerations that may influence the prognosis in a favourable or an adverse sense. They are distributed under three main headings—namely, the past history of the patient, his physical signs on examination, and the action of therapeutic agents upon him. Over 1000 references to the literature are given, and the volume has a good index. It is a collection of information, well written and arranged, and may be warmly commended to the attention of all medical men as well as those who are particularly interested in pulmonary tuberculosis.

The Diseases of Children.

By Sir JAMES FREDERIC GOODHART, Bart., M.D. Aberd. Tenth edition. Edited and revised by GEORGE FREDERIC STILL, M.D. Cantab. London: J. and A. Churchill. 1913. Pp. 959. Price 16*s.* net.

A BOOK which has gone through ten editions requires scant attention on the part of the reviewer. There can be but few well-equipped medical men in this country who do not possess a copy of this standard work, and so closely does each succeeding edition keep abreast of the times that it is exceedingly improbable that the next generation of practitioners will have to look elsewhere for their information on the subject of the diseases of children.

In his preface to this new edition Dr. Still explains that the work of revision has been shared by Sir James Goodhart, that some of the additions are his, and that all alterations have been submitted to his approval. Several new illustrations have been added, and the chapter on anterior poliomyelitis has been entirely rewritten. For the rest the volume remains very much as in former editions, and, thanks to the reviser's skill, it still retains the original author's freshness of style. The chapters which relate to rheumatism and rheumatic conditions will be read with interest by those who are familiar with Sir James Goodhart's views on these subjects, and in this new edition the skill with which the older theories of the rheumatic and convulsive diatheses are reconciled with the more modern findings of the bacteriologist reflects infinite credit on the acumen of the reviser. It is possible that the adoption of the German classification of such convulsive phenomena as spasmus nutans, eclampsia infantum, laryngismus, and tetany under the single generic title of spasmophilia would have made these different subjects more comprehensible to the average student. Chorea and rheumatism are discussed in consecutive chapters, while rheumatoid arthritis, chronic arthritis with enlargement of the glands and spleen (Still's disease), and gout are included in the chapter on rheumatism. The chapter on abnormalities of development includes excellent descriptions, with illustrations, of the somewhat rare conditions, achondroplasia, cleido-cranial dysostosis, and oxycephaly.

This new edition retains all the merits of its predecessors without any material sacrifice of conciseness. It may be safely commended to the notice of both students and qualified practitioners as a work which thoroughly represents the best teaching on the subject of the diseases of children.

Lehrbuch der Organotherapie mit Berücksichtigung ihrer Anatomischen und Physiologischen Grundlagen.

Edited by WAGNER v. JAUREGG *and* GUSTAV BAYER. *Leipzig: Georg Thieme. 1914. Pp. 516. Price 13 marks.*

As is pointed out in the preface to this book, the discovery of the physiological activity of the thyroid gland and of the possibility of using preparations of its substance for therapeutic purposes was followed by a period of uncritical enthusiasm in which similar effects were expected and even stated to follow the administration of extracts of many other organs, and these were recommended for the treatment of a heterogeneous collection of diseases. Such indiscriminate medication was naturally followed in turn by a revulsion of feeling in which the whole subject of organotherapy fell into disrepute, and we are only gradually learning to sift the true from the false and to ascertain the real limits of this form of treatment. The book before us gives a useful account of the work that has been done in this field. It is written from a practical point of view, and is intended for the practitioner of medicine in search of guidance in the treatment of disease, although the scientific side of the questions dealt with is very fully discussed.

The first section, written by Dr. M. Höfler, gives a historical account of the development of knowledge of the use of extracts of various organs in medicine, the earliest traces of which may perhaps be seen in the idea that devouring such things as the heart of a savage animal would confer on the eater the quality of courage, and so forth. Curious customs, such as totemism and theophagy, are incidentally discussed. The second section, on the morphological basis of organotherapy, by Professor Alfred Kohn, treats of the anatomy and histology of the organs that are supposed to possess internal secretions, and is illustrated by numerous cuts. The individual organs are then taken up in successive sections, the thyroid gland, about which we have much the most certain knowledge, being dealt with by Professor v. Jauregg, and the parathyroids by Professor F. Pineles. Removal of the latter "epithelkörperchen" produces tetany, but their administration as a remedy seems of no value, though transplantation in animals may be successfully carried out. The thymus gland, dealt with by Dr. Karl Basch, is an interesting organ developmentally, the nature of its cells being somewhat obscure. Removal of it in young animals seems to lead to defective development of the bones and sometimes to defective sensibility, cachexia, and death in coma. The value of thymus preparations, which have been tried in Graves's disease, rickets, and other affections, remains doubtful.

The pituitary body or hypophysis is the subject of a section written by Dr. L. Borchardt. The gland consists of two parts, the anterior and posterior lobes, each possessing a different structure, and the physiology of the whole is not well understood. Disease of the hypophysis is associated on the one hand with acromegaly, possibly due to increased functional activity, and on the other with increased deposit of fat accompanied by defective development of the generative organs (dystrophia adiposo-genitalis), said to indicate diminished internal secretion. An appendix to this section is devoted to the pineal gland, to which an internal secretion has recently been attributed, although morphologically it seems to represent a median eye-rudiment. Lesions of this body are associated with increased growth and genital precocity. The pancreas, which is chiefly of interest in connexion with diabetes, is treated of by Dr. R. Ehrmann, and the suprarenal bodies by Dr. G. Bayer. In spite of the discovery of adrenalin and of its later synthetic reproduction the physiology of the adrenals is not very clear. The double structure of the glands, which possess a cortical and a medullary portion of quite different histological appearance, complicates the question as to their function in the body, while the association of Addison's disease with visible lesions now in one, now in the other, portion increases the difficulty. The organotherapeutical relations of the genital organs are discussed by Dr. A. Foges, and a concluding section by Dr. Bayer collects together a mass of information on the possible value of extracts from other organs and tissues, such as liver, bone marrow, kidney, spleen, and so forth.

The treatment of the subjects throughout is very full and thorough, and much pains have been taken to make the account of recent investigations in this field complete. We recommend the book to all who are interested in the subject of organotherapeutics, either theoretically or practically.

Therapeutics, Dietetics, and Hygiene: An Australian Text-book.

By JOHN WILLIAM SPRINGTHORPE, M.D. Melb., M.R.C.P. Lond., Senior Physician to the Melbourne Hospital. In two volumes. Vol. I.: Hygiene and Dietetics. Melbourne: James Little. 1914. Pp. 604. Price 25*s.* net per volume.

THE real interest and value of this book lie in the special information on hygiene as related to life in Australia. The dietetic habits and food-supply of the various districts and cities of the Commonwealth are reviewed and criticised; there are some excellent chapters on dietetics in general in which the author takes up a broad and confident standpoint, in marked contrast to much that has been written in other parts of the world. The account of the chemical classification of foods is unequal, for of seven pages five are devoted to fats and lipoids, but we may add that the account given of these important bodies is very sound. The survey of modern theories on dietetics is one of the best sections in the book, though here there is no pretence at any originality. In the course of describing methods of indicating food values reference is made to the ingenious balance devised by Irving Fisher for arranging accurate diets rapidly.

Medical officers of health and "publicists" will find a mass of interesting material in other chapters, which deal with regulations in force in the various areas of Australia, but we could have wished for more information on that important question of to-day, the extent and certification of venereal disease, in the light of the experience of these colonies.

Though there is much that is of interest in this volume, it hardly fulfils the requirements of a "text-book" of hygiene either for a student or for a practitioner. The more important parts of the practical chapters on public health may be found in the works of Parkes, and Thresh and Porter, and such subjects as the examination of water-supplies had far better be studied in the original books. Instruction here should be very precise, and the gaps in the information supplied in this book are conspicuous. Thus in the consideration of the softening of water the Porter-Clark process is mentioned, but there is no hint as to the nature of the process. Again, in treating of the examination of sewage and sewage effluents reliance is placed entirely on the "soloid" tests.

This is a meritorious book, possessing many good qualities and providing much useful information. We have indicated a few directions in which improvements may be made in any future issues.

Taschenbuch für Frauenheilkunde und Geburtshilfe.

Von L. JANKAU. Vierte umgearbeitete und vermehrte Auflage. Leipzig: Repertorienverlag. 1914. Pp. 354. Price 7 marks.

THIS forms really an encyclopædia containing an immense amount of statistical and other information. The first part deals with the anatomy and physiology of menstruation, pregnancy, labour, and the new-born child. The second part deals with various methods of examination, both clinical and microscopic. The third part deals with clinical facts of all kinds, and the fourth with treatment. The whole is a collection of useful facts in an easily accessible form in connexion with the subject of diseases of women and midwifery. As a reference book it certainly should prove most useful.

Industrial Poisoning from Fumes, Gases, and Poisons of Manufacturing Processes.

By Dr. J. RAMBOUSEK. Translated and edited by THOMAS M. LEGGE, M.D. Oxon., D.P.H. With illustrations. London: Edward Arnold. 1913. Pp. 360. Price 12*s.* 6*d.* net.

THE continental countries, especially Germany, afford a most instructive field of study as to the administrative measures in force there in regard to industrial diseases and factory hygiene, and H.M. Medical Inspector of Factories in this country, Dr. T. M. Legge, has done a good service in presenting in the English language this work by Dr. J. Rambousek, the professor of factory hygiene and chief state health officer at Prague. As Dr. Legge points out, Dr. Rambousek has peculiar advantages in dealing with this broad and important subject, since he is a medical man, a chemist, and a Government official having control over industrial matters. He is therefore equipped with the very special knowledge required to describe the manufacturing processes giving rise to injurious effects, the pathology of the lesions set up, and the preventive measures necessary to combat them. In these few sentences the scope of the book is summed up, as will be seen from a consideration of the subjects dealt with in the three parts into which it is divided.

Part I. gives a description of the industries and processes attended with risk of poisoning, and the incidence of such poisoning is discussed. Part II. relates to pathology and treatment of industrial poisoning, and Part III. to preventive measures against industrial poisoning. The field covered is remarkably wide having regard to the size of the volume, and the descriptive chapters show how thoroughly studied and carried out are the regulations abroad which are framed to safeguard the health of the workers in the dangerous occupations described. We could not find any omissions. Even the cigar industry is included in the category of a dangerous trade owing to the injury to the health of tobacco workers caused by dust and fumes unless special methods of ventilation are adopted. There is a very serviceable appendix attached which contains a wealth of references.

The book is a valuable addition to the literature of dangerous industrial occupations, and is most interesting reading, whether the reader is or is not directly concerned with the subject.

Klinik der Nervenkrankheiten: Ein Lehrbuch für Ärzte und Studierende.

Von Dr. LEO JACOBSOHN. *Mit 367 Abbildungen im Text und 4 Tafeln in Farbendruck.* Berlin: August Hirschwald. 1913. Pp. 488. Price 19 marks.

THE author states that his object in writing this text-book for physicians and students is the production of a compendium of clinical neurology in which theoretical considerations are to be kept in the background, while only an irreducible minimum of pathological anatomy is to find a place. With this end in view the clinical aspects of nervous disease have been emphasised by the incorporation of a large number of unusually fine photographs; nervous diseases rather lend themselves to illustration in this way. It is true that the importance of the subjects illustrated is somewhat unequal, for rare anomalies, such as syndactyly, polydactyly, and muscle agenesis, are exemplified, while there is, on the other hand, for a text-book a poverty of diagrams.

In his task of supplying a useful and practical manual of clinical neurology the author has been very successful. If there are no particularly profound studies of any of the diseases dealt with, his handling of his material is uniformly sound. The teaching value of the book is considerable. The first part is taken up with methods of investigation, general symptomatology, and the principles of treatment. The second part consists of a systematic description of diseases of the peripheral nerves, the spinal cord, brain, meninges, followed by the neuroses, diseases of the vasomotor and sympathetic systems, diseases of the ductless glands, and other morbid conditions. The absolute rarities of neurology are omitted, but we should think the practitioner will not find the book wanting in regard to any nervous symptom he is likely to come across in the course of general medical work.

LIBRARY TABLE.

Palissy, Bacon, and the Revival of Natural Science. By Sir THOMAS CLIFFORD ALLBUTT, K.C.B., F.R.S. A paper read at the International Historical Congress, April, 1913 (from the Proceedings of the British Academy, Vol. VI.). London: Published for the British Academy by Humphrey Milford, Oxford University Press. Pp. 15. Price 1s. net.—Bernard Palissy shares with Robert Bruce's spider the honour of being an example to youth of the benefits of perseverance. Every well-instructed child has heard the story, as told by Palissy himself, of his struggles to produce finely glazed ware, with ornament in high relief, of his many failures, of his poverty, and finally how he burned the wretched furniture of his poor home to keep his furnaces going, and achieved success. But few persons, even those who are well read, know that Palissy was a really learned chemist and student in various branches of physical science, that he studied geology, and arrived at very sound conclusions with regard to the earth's history. His "Discours Admirables" are astonishing documents for the date (1580) at which they were published. Sir Clifford Allbutt, in the paper now before us, gives a résumé of the contents of Palissy's "Discours," of the lectures he gave (1575-1584) on geology and agricultural chemistry, and of the museum which he had organised wherewith to illustrate his lectures. Not only fashionable Paris but the leaders in science of the time attended his lectures, and at p. 329 of the edition of his works published by Charavay Frères (Paris, 1880) we find a list of them. First come 13 doctors of medicine, beginning with Maistre François Choisnyn and Monsieur de la Magdalene, physicians to the Queen of Navarre, then Alexandre de Campège, physician to Monsieur the Brother of the King. Next come the surgeons to the King, headed by the illustrious Paré, and after these a numerous throng of ecclesiastics, lawyers, and other learned persons, including Maistre Michel Saget, delightfully described as "homme de jugement et de bon engin." Palissy, his museum, and his lectures give occasion to Sir Clifford Allbutt to propound the interesting theory that Bacon, who went to Paris in 1576 with Sir Amyas Paulet, must have attended Palissy's lectures, and so was led to that study of direct investigation of Nature by facts which he later developed into the Instauratio Magna. It is true that Bacon nowhere mentions Palissy, but, as Sir Clifford Allbutt reminds his readers, Bacon was not the sort of man to mention that he had had friendly intercourse with one who like Palissy lay under suspicion on account of his revolutionary views, both religious and scientific.

The Anatomist's Notebook: A Guide to the Dissection of the Human Body. By A. MELVILLE PATERSON, M.D. Edin., F.R.C.S. Eng., Professor of Anatomy in the University of Liverpool. London: Henry Frowde and Hodder and Stoughton. 1914. Pp. 351. Price 6s. net.—Professor Paterson has done wisely in naming his volume a "notebook." It is an aid to dissection, and can be regarded as a useful substitute for the student's working notebook, but it would be a mistake to regard it as more than that, and to attempt to make it supplant any of the ordinary dissecting manuals. The author himself says that its use should "be supplemented by means of a knowledge of osteology and by means of a systematic text-book," and until the staff of demonstrators is enormously increased in our anatomical departments, or a far more self-reliant generation of students arises, it will be impossible to carry on dissections properly without the aid of one of the current manuals. As a notebook it is worthy of all praise; its outline drawings are excellent; its text is very brief, and it is freely interspersed with blank leaves for the dissector's own notes and sketches. There is no doubt that the student who adds this notebook to his working outfit will be all the better for its conscientious use. The nomenclature is that familiar to most medical students, and but few new terms are used.

JOURNALS AND MAGAZINES.

Archives de Médecine et Pharmacie Navales.—In the March number Dr. Plazy, staff surgeon in the French Navy, relates his experiences with salvarsan and neosalvarsan. He has treated 80 cases with 700 or 800 intravenous injections. As salvarsan is rapidly excreted (arsenic appears in the urine in 15 minutes and has ceased to be demonstrable within 48 hours), Dr. Plazy repeats injections with only two or three days' interval, and he gives many injections to each case, usually nine or ten within three or four weeks. He begins with 0·3 grm. and gradually increases to 0·9 grm. For infants and very stout patients he recommends that neosalvarsan be administered by enema, in doses of 2½ to 5½ grm. These injections in no way irritate the rectal mucosa, and appear to be readily absorbed, since the Wassermann reaction has been found negative soon after them.—Dr. Bouthillier and Dr. Goéré, staff surgeons in the French Navy, observing that Dr. R. S. Frew and Dr. A. E. Garrod reported in THE LANCET of Jan. 4th, 1913, cases of glycosuria during tuberculous meningitis, give an account of a case of pneumococcal meningitis which showed glycosuria on the first day, and excreted 457 grains of sugar during the second day. Lumbar puncture was then done and 30 c.c. of fluid under pressure were taken away. 20 c.c. of antimeningococcus serum being injected, the patient at once began to improve, passed no more sugar in his urine, and steadily recovered.—The sanitary precepts issued to the Italian expeditions in Libya are discussed. It is interesting to find that the drinking of even small quantities of wine is strongly discouraged in the Italian navy, histories being given of an expedition that failed through sickness when sutlers and wine-sellers followed the troops, and of another that succeeded, though more arduous, when all camp followers had been turned back. The importance of personal cleanliness and of the burying of excreta is effectively put before the sailors.

The Child.—The first article in the April issue of this journal is one by Dr. J. F. Halls Dally on Biometric and Eugenic Studies of Elementary School Children, based on the results of a detailed examination in the course of medical inspection for the London County Council of 975 children at the Jews' Free School, Bell-lane, London, E. The results of Dr. Dally's investigations are interesting. Other articles are Heredity and Education, by Professor Peter Sandiford, of the University of Toronto; Eczema in Children and its Treatment, by Dr. J. L. Bunch; and Child Welfare in Relation to Tonsils and Adenoids, by Dr. C. A. Adair Dighton.

Tumori. Archivio bimestrale fondato da G. Fichera. Roma, April 10th, 1914. Anno III. Fasc. V.—The last number of this publication contains several interesting articles. Dr. Fichera himself discusses new growths having the same structure as sympathetic nerve tissue. According to the nomenclature adopted by the Brussels International Commission of August, 1913, the name of the tumour described by him would be "myelinic gangliocellular neuroma." The tumour is retroperitoneal in origin, springing from the lumbar sympathetic. It occurred in a girl aged 15 years, and was diagnosed as a retroperitoneal fibro-sarcoma. After removal it weighed 550 grammes, was oval in form, its diameters being 13 and 11 centimetres.—Dr. Izar and Dr. Ferro continue their researches on antigens for the meiostagmic reaction in malignant tumours, experimenting with the esters of mannite and cholesterine.—Dr. V. Saviozzi draws attention to the intestinal symptoms associated with renal tumours. These are always present during the existence of renal tumours, and depend on the compression that the tumour exerts on a lengthy portion of the descending colon. This compression takes place gradually and slowly and increases progressively *pari passu* with the intensity and extent of the pressure exercised on the colon. The symptoms are those of progressive intestinal stasis.—Dr. A. Cimoroni discusses chronic mastitis and benign tumours of the mamma in a lengthy article on 61 cases observed at Professor Bastianelli's clinic at the Policlinico at Rome. They consisted of 14 cases of chronic mastitis, 1 of hypertrophy, 11 of cystic and 35 of solid tumours, and form a most interesting series of cases.

The Candid Quarterly Review of Public Affairs: Political, Scientific, Social, and Literary. Conducted by THOMAS GIBSON BOWLES. London: Henry Garratt. Price 5s. net. Subscription £1 per year, post paid to any part of the world.—The second number, dated May, 1914, of this new quarterly review, lies before us. It contains 15 unsigned but well and weightily written articles on matters political, economic, and military. There is nothing in this issue of especial interest to medical men as such, and the natural sciences are represented only by an article on the weather and its prophets, in which the growth and trend of present investigation into the data for a science of weather-lore are described. The character of most of the articles, unhampered by any appeal to the authority of a name, indicates that while they are open to contention they are for the most part by a writer or writers equipped with a wide study of the respective subjects and endowed with a power of original thought.

British Dental Journal.—Dr. N. N. Znamensky in the May 15th issue contributes a paper on the Causes of Alveolar Pyorrhœa. The changes occurring in the bone he describes as an osteoporosis, and he considers that the lesion either may develop in the bone itself or may be secondary to pathological changes in the gum around the tooth. He considers that arterio-sclerosis plays an important part in the development of alveolar pyorrhœa. Mr. H. Dewe Mathews contributes a "Note on the Present Treatment of Pyorrhœa." An abstract of the preliminary programme of the Sixth International Dental Congress appears in this issue.

BATH MINERAL WATER HOSPITAL:

THE NEW PATHOLOGICAL LABORATORY.

ON the afternoon of Thursday, June 4th, Sir William Osler, Regius Professor of Medicine in the University of Oxford, opened, in the presence of a representative gathering, the new pathological laboratory which has recently been established at the Royal Mineral Water Hospital of Bath. The Rev. C. E. B. Barnwell, President of the hospital, took the chair, and in his introductory remarks gave a succinct account of the history and growth of the hospital since its foundation in 1737.

Sir William Osler's Address.

Sir William Osler then addressed the meeting. He said that change was the order of the day; the only thing that did not change was man, and he did not change through the countless ages. As far as diseases went man had changed very little during the historical period. Doctors even had not changed much. For some diseases people were probably just as safe in the hands of Hippocrates and Galen as in the hands of Dr. Llewellyn or in his own hands; but there was one thing that had changed—namely, method: the way of looking at and investigating things. That had changed absolutely and radically, and it was as representing that change that their laboratory was opened that day. Sir William Osler then gave as an illustration the case of typhoid fever. This, he said, in the last generation was well treated (though with more drugs) and well nursed, and when the patient left the hospital doctors and governors were all rather pleased that the case had recovered, and nothing further was done. But nowadays there were at least four agencies at work in hospital upon a case of enteric fever. In the first place, much greater care was taken in the diagnosis, involving elaborate methods which required expert knowledge, and great skill, and represented long and laborious researches. Then the case was treated certainly with fewer drugs, was probably better nursed and was not sent out of the hospital until it was shown to be safe from the standpoint of the community, until it was known not to be a distributing centre of typhoid bacilli. Again, the case was reported to the health authority and the conditions under which it arose were investigated, while no hospital was nowadays complete that looked after a case only from the medical standpoint; they had to regard patients from a wider and humanistic standpoint, from the standpoint of social service. Thus care was taken that the conditions in a home where a case of typhoid fever arose were so altered that another case did not occur, and this social service work in connexion with a hospital was an enormous addition to its usefulness in a community. Lastly, there were interesting modern developments altogether in association with and as a result of laboratory methods. If, for instance, a case of typhoid fever occurred in a large household or common lodging-house, the medical officer of health saw that all persons exposed to infection were inoculated; for it had been shown unquestionably that anti-typhoid inoculation was not only safe but was imperative where large bodies of persons exposed to the disease were being dealt with. Sir William Osler here instanced the remarkable results achieved in the United States Army, and then turned to the disease having the most direct bearing on the work of the Royal Mineral Water Hospital—viz., chronic arthritis. A generation ago, he said, a case came into the hospital and they merely put it down as rheumatoid arthritis. To-day they studied such cases and differentiated them into separate groups with the object of determining their cause. He instanced the search for a septic focus in teeth or tonsil, or for some source of intoxication in the gastro-intestinal tract, or for some process of auto-intoxication as in gout. Here were three types of cases, and it was to be hoped that within a few years, by investigation pursued along these three lines, some well-defined knowledge would be reached of the cause of this terrible disease, so prevalent, so distressing for the individual, and causing such waste of human energy and life. Sir William Osler then touched on the aims and opportunities of the new laboratory, and in this connexion he uttered a word of warning against the establishment of too many laboratories with too many men entering a career which might lead a certain number of them into a blind alley. A laboratory should be specifically for the benefit of the sick in the hospital, for the purpose of diagnosis and treatment; but in laboratories associated with large collections of cases, as in that hospital, in the interests of the public the laboratory should be a centre of research. At Bath there was a great opportunity of studying types of rheumatoid arthritis with an ulterior object. The problem of the cause of arthritis would certainly be solved; they were now on the high road in getting accurate knowledge of different groups of the disease. There was a magnificent opportunity in Bath to make a very thorough scientific study of the whole subject of arthritis. For this purpose a good museum and a well-equipped and up-to-date library were both most important; also a new X ray department. Their laboratory was excellent, and it remained to be seen what they did with it; everything would depend on whether they had the courage and the money to get the right sort of men to manage it. Sir William Osler concluded his most lucid and interesting address with wishes for the prosperity of the institution and a reference to the long and distinguished medical history of Bath.

The Mayor, Dr. Preston King, in proposing a vote of thanks to Sir William Osler, congratulated the committee on the opening of the laboratory, which had been a very great need for many years. It marked an epoch not only in the existence of the hospital but also in the city of Bath. Dr. R. L. J. Llewellyn, in seconding the vote of thanks, pointed out that to Sir William Osler perhaps more than any other living physician they were indebted for inculcating the necessity on the part of physicians of acquiring a truly critical and scientific attitude of mind. Dr. J. Michell Clarke, Professor of Medicine in the University of Bristol, followed and paid a warm tribute to Sir William Osler's services on behalf of scientific medicine in England. He expressed the hope that the University of Bristol would still further cement the union between the two cities of Bath and Bristol, between which the medical associations had always been close.

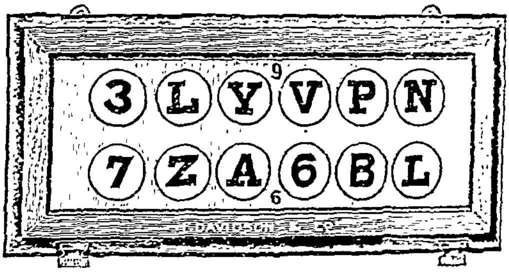
The New Laboratory.

The present laboratory is a large, well-equipped, and airy room in what was formerly the Nurses' Home. It replaces the small underground laboratory which was established six years ago and mainly upheld by grants from the medical staff. The pathological work done during the past year has been the investigation of joint fluids from bacteriological, cytological, and chemical points of view, and the estimation of tuberculin and Wassermann reactions in relation to chronic arthritis. The hospital is not a local institution, for the patients come from all parts of the British Isles, and it therefore deserves support from the country at large. An endowment fund for the laboratory and research scholarships would be a great boon, while morbid specimens, books, and reports dealing with chronic joint disease would be welcomed by the pathologists, Dr. J. M. H. Munro and Dr. G. H.-H. Almond, from members of the profession throughout the country. In the evening Sir William Osler and other medical guests were hospitably entertained to dinner at Fortt's Restaurant by the medical staff of the hospital.

New Inventions.

MOVABLE TYPE FOR TESTING THE EYES.

I HAVE frequently found that in testing the eyes in large schools the scholars have been able materially to assist their power of vision by committing the test type to memory. To obviate this I have designed a system of movable type which has been successful in practice. The type is mounted on a ribbon which travels behind a white plate through which little circular windows have been cut. The tape runs on rollers after the manner of a roller film camera, and by a half turn of the roller the order and lettering of the type are completely changed, so that several variations of lettering are obtained at will. The whole thing is 10 × 4 × 1 inches, and may be conveniently carried in the bag of the medical inspector. One might with advantage be permanently fitted in all large schools.



Messrs. Davidson and Co., Great Portland-street, London, W., are the manufacturers of the movable type.

Huntingdon. C. B. MOSS-BLUNDELL, M.D. Brux.

SCREW PLATFORM AND SCREW-CONVEYING FORCEPS.

IT is generally conceded that in the plating of fractures a rigid technique must be employed. If handling is to be avoided and assistance is limited, it is of great convenience to be able to select the required screw at a glance and pick it up easily. I have for some time been using the screw platform illustrated in Fig. 1 and screw-conveying forceps (Fig. 2), and have found them convenient and efficient. The apertures for the screws are so calibrated that the heads project just above the level of the surface. The screw-conveying forceps, of dissecting pattern, picks up a screw easily and certainly, and grips it sufficiently to steady it while being screwed home. The platform is reversible because the screw holes are complete perforations. The platform, containing a complete selection of screws of different sizes and lengths, can be boiled, and when required placed on the towel, where suitable screws can be rapidly and readily picked out.

FIG. 1.

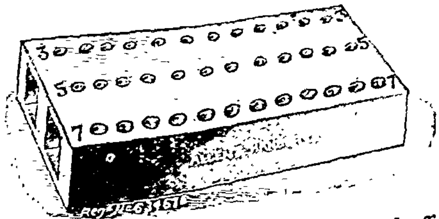


FIG. 2.

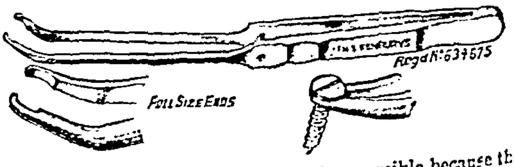

The instruments have been made to my design by Messrs. Allen and Hanburys, Limited, Wigmore-street, London, W.

ICHTHYOL

WE WARN BUYERS that fraudulent and ineffective articles purporting to be Ichthyol or "equal to Ichthyol," are offered by unscrupulous dealers.

GENUINE ICHTHYOL, as it has been studied and is wanted by the Medical Profession and supplied all the time to the Trade, is delivered by us in tins and bottles under our special label with our name, and can be obtained in original packing from any wholesale druggist in the U.K. The use of our Registered Trade Marks "ICHTHYOL" and "ICHTHYOLATE" for any other product means deception and dishonesty, and will entail their penalties.

PHYSICIANS, CHEMISTS, and DRUGGISTS are requested to report to us all cases where imitation products are suspected.

"THE CHANCELLOR"

Genuine Pure Grape

BRANDY.

Extract from THE LANCET, May 9th, 1914:—

"We have submitted this brandy to analysis, and the results support the claim that it is a pure grape spirit. ...... Although not produced in the Cognac district, it possesses similar characteristics to the products of the Charente. It is mellow, and free from crude products. ...... It comes well out of comparison with the matured spirit produced from wine distilled in the Cognac district."

Per 50/- Dozen.

SAMPLE FREE ON APPLICATION.

PURITY— It is distinguished by its
It has been distilled from WINE only.

AGE— It is TWELVE years old.

LETTERS TO MEDICAL MEN

RESULTS, NOT "EXPECTATIONS," THE REAL TEST.

Clinical Evidence the Real Test.

DEAR SIR,—In a notice on Phylacogens in the "British Medical Journal" of May 2nd, the following remark occurs:—"So far as we have been able to gather, neither clinicians nor bacteriologists in this country are enthusiastic in their expectations of finding in the Phylacogens means of curing hitherto obstinate and incurable diseases." We desire to point out that the Phylacogens are not recommended upon theoretical grounds, but upon direct clinical evidence.

No Room for Dogmatism.

Since the therapeutic use of Phylacogens involves a departure from accepted theory and practice, it is not at all strange that clinicians and bacteriologists are not enthusiastic regarding it. Every innovation or discovery in medicine has always been confronted with a similar lack of enthusiasm. In a science so inexact as therapeutics discrimination and caution are essential, and there is little room for dogmatism. In the end theories have to be modified to fit the facts; and so it is with the Phylacogens. Because they do not accord with accepted theories it naturally follows that they make headway only in so far as they actually succeed where other remedies fail; they stand or fall by that test.

Phylacogens to be Judged by Results.

The real test of any system of medicine is not the "expectation" of those practitioners who employ it or of those other practitioners who simply look on, but what has actually been accomplished. When used primarily in an acute case, it is perfectly justifiable for anyone who is so inclined to say that something else would have done as well; that is to be expected. **Doctors are asked to test Phylacogens in suitable cases where other remedies have failed, and to judge by results.** As one writer recently said, the whole history of medicine shows that it is the clinical proof of the *curative value* of a new remedy that is of paramount importance to the physician. "The scientific explanation of how a remedy acts is highly desirable, and when established permits of greater precision and effectiveness in its use; but that the lack of it in no way invalidates clinical proof, nor stops the use of any remedy by those with the moral courage to do the best thing for the patient, is proved by the history of quinine, mercury, the salicylates, the iodides, and many other drugs."

We have nowhere claimed that Phylacogens will cure "hitherto incurable" diseases, but we claim, and we have evidence to prove, that diseases which have baffled the skill of physicians for 3, 5, 10, 15 or more years have been so influenced by Phylacogen treatment that the individuals suffering from them have, in the usual sense of the term, been "cured."

Some of the Results Obtained.

The *recorded* results of Phylacogen therapy in this country show 320 cases, reported by more than 150 medical men, of which number 89 per cent. are said to have been cured or much improved. A partial list of the conditions treated with Phylacogens, and reported, includes the following: rheumatism, 130; gonococcal infections, 89; pneumonia, 12; puerperal septicæmia, 12; sciatica, 9; otitis media, 6; eczema, acne, sycosis, iritis, erysipelas, chorea, neuritis, toxæmia, furunculosis, &c., &c. These reports come from London, Edinburgh, Glasgow, Manchester, Liverpool, Birmingham, Leeds, Sheffield, Dundee, and, indeed, from all over the country. Of these 320 cases, 33 were reported as unsuccessful, and in 5 cases the treatment was discontinued. In addition to these definite reports, we have had hundreds of opinions expressed in favour of Phylacogens by medical men who decline to give clinical reports. In cases where medical men have expressed adverse opinions, we have endeavoured to ascertain the actual facts, and where particulars have been furnished to us the cases have been recorded.

Reports by British Physicians.

We are constantly being invited to supply clinical evidence of the value of Phylacogens, furnished by British medical men, and in order to meet this demand we have adopted the system of addressing letters to the medical profession through the medium of the medical journals, incorporating in these letters the views of medical men who have made use of the new system of therapy. This, we need hardly say, is in no case done without the consent of the doctor concerned. *After all*, the men who constitute the court of first and last resort, and who pronounce the final judgment on the value of any treatment, are the practitioners who use the remedy on their patients. The value of the observations of these men is inestimable. As one writer, in giving the results of two and a half years' experience with Phylacogens, remarks:—"We practitioners have been, are, and always will be, attending to our part of establishing the position of a new remedy, and it is high time that theorists and special research workers should attend to their duty of explaining our results by careful impartial investigation, instead of arbitrarily belittling our clinical efforts."

We remain,
Yours respectfully,
PARKE, DAVIS & CO.

THE LANCET.

LONDON: SATURDAY, JUNE 13, 1914.

The Value of the Coroner's Inquest.

Dr. F. J. WALDO, coroner for the City of London and borough of Southwark, prepares annually a report relating to the inquests held by him in the two areas of his jurisdiction. We have received the report for 1913 with his comments upon the salient features of the various inquiries, and it supplies, as it has done on previous occasions, matter for discussion closely affecting the public safety. The report, indeed, suggests that a series of similar documents from coroners, uniform in character and officially published for the information of those interested in domestic legislation, would be of considerable usefulness, not only to the medical profession, but to the community at large. Let us take an instance. Every now and then an inquest on the body of a person murdered, or supposed to have been murdered, followed by the necessary investigation in a police court and trial before a judge and jury, produces criticism of a nature *hostile* to the coroner's inquest. The usefulness of the inquest is denied, its methods are derided, and it is pronounced superfluous upon insufficient consideration of a limited section of the duties for which it exists. It is quite true that in an important class of cases the matter into which a coroner inquires is reconsidered before magistrates and again under the presidency of a judge of the High Court, and that the verdict of a coroner's jury is not always endorsed by that of the jury at assizes. Equally it may be found that evidence given on oath in a coroner's court upon a general inquiry into the cause of a death is not admissible before magistrates or before a judge against a person who has been definitely charged with murder or manslaughter. But to condemn the coroner's inquest to extinction upon consideration of these points alone is to ignore the far greater number of cases in which a coroner's inquest shows that no evidence exists upon which a charge of murder or manslaughter can be based. On these occasions, and indeed at all inquests, the public nature of the inquiry and the fact that the evidence is not limited to that affecting particular persons implicated should reassure public opinion. For frequently the inquiry absolves persons who otherwise would have remained subject to undefined charges, while at other times it enables suggestions to be made by members of the public with regard to matters affecting themselves as such. It is true that there are occasions when evidence is given which the education and training of the members of a coroner's jury hardly fit them to weigh adequately, but this is chiefly the case with regard to medical evidence concerning which a medical coroner can supply the necessary guidance. The importance of appointing medical men as coroners is already widely recognised, and is likely to be increased rather than diminished by the alterations in procedure with regard to inquests which have recently been recommended. The purely medical coroner may be weak on legal procedure, but the purely legal coroner is at least as likely to be weak on medical evidence, and the public run more risk under the latter's administration. It is possible that in the future a dual qualification will be demanded by far-seeing communities.

Among subjects of importance prominent in Dr. WALDO's report will be found the consideration of deaths due to vehicles. These, we need hardly point out, are not confined to the City of London or to Southwark, and would be found to occupy considerable space in the reports of coroners throughout the kingdom and in rural as well as urban localities. In the commercial centre of London the use of horses for heavy traffic is no doubt responsible for the fact that although motor vehicles cause many deaths there is still a noticeable proportion due to horse vehicles. The total number of such deaths during 1913 was 50, of which 22 took place in the City, 15 through motors and 7 through horse-drawn vehicles; 28 took place in Southwark, of which 20 are assigned to the former mode of traction and 8 to the latter. It is satisfactory to learn that this total is less by 11 than that of 1912, an improvement which may be due to an increase of central refuges or islands in the roadway. Dr. WALDO recommends that the number of islands should be still further augmented, and notes that juries have in many instances added riders to their verdicts calling attention to the need of them at particular spots. The construction of subways is not often advised nowadays in the light of experience. Those who will take the trouble to use them are comparatively few, and when not used they become a source of danger, for while the authorities are satisfied that they have supplied a safeguard no advantage is taken of it. The habit of dexterously crossing roads thronged with motor vehicles is being acquired, and this, when it is combined with an increase in the number of refuges, and an advance in the skill of drivers, should much minimise street accidents. But when accidents do take place they are usually of a very serious character, and a toll of human life amounting annually to 50 in a limited, if congested, area is a matter for serious consideration, when we remember that such an accident rarely takes place in circumstances which render it unavoidable. Two topics of importance are mentioned in this connexion in Dr. WALDO's report: the first is the possible compulsory adoption of guards or fenders for motor omnibuses and lorries, and the second the provision of ambulances for the removal of the injured when an accident takes place. The guards already in use upon many omnibuses are more or less of an experimental character, but more such devices would follow if a widespread use of them was present to stimulate the ingenuity of inventors. With regard to the extended use of motor ambulances, the City proper has long set an example to the rest of London, and the delays which have taken place in the organisation of a proper ambulance service for the County of London, and their various causes, do not call for discussion from us at this moment. References to the matter will be found not only in the present report of the coroner for the City of London but in those for past years, and whenever London can boast of a system of ambulances calculated to convey accident cases rapidly and safely to hospitals it will be due in no small measure to public attention having been drawn repeatedly to the matter by coroners' juries. Public opinion is not easily roused in a law-abiding population content to accept undesirable conditions of life as though they were inevitable, but in a popular tribunal like a coroner's inquest there is an opportunity for the expression of practical opinions by those most concerned which may prove at any time of value to the community.

The stimulus to legislative reform or municipal enterprise which is supplied by the verdict of the coroner's jury may manifest itself in many obvious ways. The dangers of flannelette and of celluloid in connexion with the loss of life through fire, the danger to infant life through children in humble circumstances sleeping in the same bed with their parents or playing in crowded rooms with unguarded grates, are matters in which the legislature has sought to interfere, and with regard to which the public mind is now generally better informed, largely through the intelligent efforts of coroners, than it was a few years ago. With respect to the wanton loss of infant life, the law has been brought into action in an appreciable degree by the expressed opinions of coroners' juries when the evidence has demonstrated that preventable deaths have occurred, and their verdicts have been delivered with force and unanimity largely because of the class from which coroners' juries are drawn. To these juries the exact conditions under which their neighbours live are very familiar, and they are able to make allowances for one witness and to neglect the testimony of another in a manner that in the long run makes for justice and reform. We should be sorry to see the coroner's court abolished unless some other tribunal with compensating advantages were substituted; and if reports supplied by many coroners were to be collected and published, in proof of the valuable nature of their duties, we think that much recent criticism would not have been uttered.

The Practical Importance of the Study of the Reaction of the Blood.

IT not infrequently happens that researches into biological problems, which at first appear to be abstruse and transcendental, prove in the light of wider experience and extended application to be of great practical significance and value. The study of the changes in the reaction of the blood, so ably and critically presented by Dr. F. GOWLAND HOPKINS in his important Oliver-Sharpey lectures, the second of which appears in our columns this week, affords an interesting case in point. The older text-books on physiology were content with the bare statement that the reaction of the blood and of its plasma was alkaline to litmus, and although a number of observations were made by titration to determine the degree of alkalinity in health and disease they achieved no general recognition until the part played by acidosis in pathology was established. The application of the methods of physical chemistry to the problem soon demonstrated that the older observations were erroneous, and that the actual reaction of the blood was practically neutral, although it was also found that considerable quantities of acid or of alkali could be added without altering the reaction of the blood.

That titration by standard acid could not be relied upon for the purpose of this estimation became evident from the fact that the end point varied with different indicators, such as litmus or phenolphthalein. Physico-chemical methods have demonstrated that the actual acidity of a solution depends upon the presence of free hydrogen ions, while alkalinity depends upon free hydroxyl ions in solution. The hydrogen ion concentration is capable of measurement even in small quantities of fluid by an electrical method. Dr. HOPKINS points out that it can also be efficiently and accurately determined by a method introduced by Mr. J. BARCROFT, which is capable of application to the clinical study of the reaction of the blood in disease. It consists in the study of oxyhæmoglobin dissociation curves, since BARCROFT and his co-workers have shown that these curves are displaced in regular fashion but not altered in form by variations in the effective acidity or hydrogen ion concentration of the blood. When the relation of the reaction of the blood to the activity of the various bodily functions is studied some interesting and important facts emerge. The respiratory centre proves to be extraordinarily sensitive to any change in reaction; the slightest increase in acidity, whether produced by carbonic acid or any other acid, leads to dyspnœa, while the slightest increase in alkalinity induces apnœa. Dr. HOPKINS refers to some other observations which tend to show that the kidneys must also be extremely sensitive to changes in the reaction of the blood and that they play an important part in regulating this reaction. It would seem that the lung controls the hydrogen ions due to carbonic acid, the kidneys those due to other acids, with the result that the mean normal reaction of the blood is adjusted with great exactness in spite of varying conditions. RYFFEL and POULTON by means of BARCROFT's method have shown that in uræmia there is excess of acid in the blood, and T. LEWIS and BARCROFT have demonstrated that cases of disease exist in which dyspnœa occurs without an equivalent cyanosis, apparently due to an increase in the proportion of acids to bases in the blood resulting from renal deficiency. Dr. HOPKINS points out that there is a good deal of evidence that the administration of alkalies increases the oxidative processes of metabolism while acids diminish them, and he suggests that the increase of alkalinity of the blood in fever may be a factor in producing the increased metabolism associated with it.

In regard to carbohydrate metabolism some interesting points are also discussed. Certain experiments by RONA and WILLENKO upon the isolated perfused heart have shown that the utilisation of sugar by the heart is lessened by rise of acidity in the fluid circulating through it, and Dr. HOPKINS mentions some interesting observations which suggest that the reaction of the blood may be a factor of great importance in regard to the mobilisation of the carbohydrate stores of the organism. It is somewhat surprising to find that the acidosis produced by strenuous exercise at high altitudes should induce more change in the actual reaction of the blood than the grave acidosis of diabetes, in which compensatory mechanisms are developed. Dr. HOPKINS multiplies examples of the importance of changes of the blood reaction to the activity of the various tissues and organs. His lectures, though apparently abstruse, prove to be full of suggestive ideas, and point the way to important practical researches in disease, and we cordially endorse his plea for the application of the methods he recommends to the study of many problems yet awaiting solution in this connexion.

◆

Certification under the Insurance Act in Ireland.

A mass meeting of the medical profession of Ireland was held last week at the Mansion House, Dublin, to consider the serious position that has arisen in regard to certification under the National Insurance Act. The exclusion of the medical benefit from the Act as it applies to Ireland has brought it about that the problems created for the medical profession of that country are quite different from those that the profession of Great Britain has had to face. Up to the present the chief difficulty has centred round the question of certification—that is to say, the provision of medical evidence entitling an insured person to the sickness or disablement benefit. Under the terms of the Insurance Act itself the onus of paying for such evidence was put on the administration funds of the Approved Societies, but no society has made use of its powers in this way further than in some instances to employ lay inspectors. Recognising that some special provision must be made to pay for certificates, the Treasury early in 1913 provided for that year a sum of £50,000. The Irish Insurance Commissioners, after consultation with the representatives of the medical profession, decided on the establishment of panels for certification on similar lines to the panels for medical attendance in England. In most of the country the panels failed to fill, the medical men considering the remuneration too small. In Belfast and Cork and in a few of the northern counties the panels filled, and have, we believe, worked satisfactorily. It is true that charges of slackness and of connivance at malingering have been levelled at the panel doctors, but, in spite of repeated invitations to produce specific cases of careless certification, neither the Commissioners nor the officials of the various society officials have reported a single instance of the kind either to the Local Medical Committees or to the General Medical Council. Nor have the Commissioners removed a single name from the panel.

The panels having failed to fill in the greater part of the country, the Commissioners last June and July appointed a number of so-called "medical advisers," whose duty was to examine patients on request from the secretary of an Approved Society. As was to be expected, these appointments did not meet with the approval of the medical profession, and the men appointed have failed to command the public confidence, while some of the Approved Societies, after a short experience, abstained from making further use of their services. Recognising that such appointments were only a makeshift, Mr. LLOYD GEORGE, in August, 1913, in the House of Commons, promised that the Treasury would find an additional sum of money for certification purposes in Ireland, the total not to exceed a capitation rate of 2*s.* 6*d.* per insured person. At that time this would have produced a sum of about £91,000. The money at the disposal of the Commissioners being now sufficient, the Irish Medical Committee, as representing the medical profession, offered its services to the Insurance Commissioners in drafting a scheme. It was not, however, until December last that this offer was accepted. The Irish Medical Committee then put forward two alternative proposals:—(1) an extension to the rest of the country of the panel scheme already in existence in some areas; and (2) a pooling scheme. Whichever scheme was adopted sufficient money to provide for the payment of referees and the provision of second opinions in necessary cases was to be deducted prior to distribution. To make this possible without undue diminution of the grants to country areas, the medical profession of the six county boroughs offered to pay out of their share the expense of referees for the entire country. The proposals of the Irish Medical Committee appeared to meet with the approval of the Insurance Commissioners, and it was hoped that a satisfactory scheme might have come into operation early in the present year. In the middle of January, however, the Insurance Commissioners held a conference with representatives of the Approved Societies. These representatives made a new demand. They asked that the Commissioners should appoint a sufficiency of whole-time medical certifiers, the societies to be relieved of the obligation to pay sickness benefit except on the certificate of one of these officers. Further, it was asked that these officers should be appointed at the nomination of the societies, but from this latter view the Commissioners dissented. After this conference the Irish Medical Committee was informed that the Commissioners despaired of formulating a scheme which would satisfy both the medical profession and the societies. There the matter has rested for nearly five months. During that time, however, the Irish Medical Committee has pressed for an interview with Mr. LLOYD GEORGE, but without effect, and has expressed its willingness to meet representatives of the societies and discuss the matter with them in the presence of Mr. LLOYD GEORGE.

Such in brief is the history of the proceedings that was put before the mass meeting last week. The meeting, in a series of resolutions, emphasised the necessity, from the point of view of the insured person, of the certificate of the patient's own medical attendant being accepted as primary evidence of incapacity. At the same time, it is to be borne in mind that the medical profession not only raises no objection to the establishment of a system of referees, but actually welcomes such a system. The present position is that the Insurance Commissioners are not unlikely to give way to the pressure of the representatives of the Approved Societies, and appoint a number of whole-time and part-time certifiers. It is scarcely necessary to point out how hardly such a system may press on the insured. At the meeting numerous instances were related of injustice to the insured through their failure under the system now in temporary vogue to receive the benefits to which they were entitled. In most instances this failure followed on the decision of a medical adviser. In one case a woman died penniless three days after a medical adviser—paid out of public funds—had stopped her sickness benefit. In another, a man died in the workhouse from cancer of the stomach ten days after his benefit had been stopped. In both these cases the certificate of the medical attendant had been ignored. In another case a patient was ordered to present himself for examination by a "medical adviser" 18 miles from his home. Such cases, we understand, are not unusual in the working of the Insurance Act in Ireland. Under a system of whole-time certifiers they are likely to be indefinitely multiplied. We do not know how far the Insurance Commissioners are committed to the plan put forward by the societies. As no public announcement has yet been made, we may assume that no scheme is yet complete. The entire success of the Insurance Act in Ireland appears to be at stake, including the working of the sanatorium benefit. The Insurance Commissioners and those to whom they are responsible will do well to weigh the arguments put forward at the mass meeting of the medical profession before they decide on a scheme which must meet with the hostility of the Irish medical profession and may submit members of Approved Societies to an intolerable tyranny.

Annotations.

"Ne quid nimis."

THE HOSPITAL CARE OF POLICE PATIENTS.

Dr. Maurice A. Cassidy has been appointed physician to the London or Metropolitan Police Force, a force which now numbers 22,000 men, and which, although a picked body, has a high sickness and injury rate owing to the arduous nature of the duties. It is clear that the appointment of a physician was absolutely required under modern conceptions of public duty towards a section of the community so large and so strenuously employed, while it seems to us that the needs of the force might well now be met in another direction. For all these 22,000 men, of whom as many as 14 per cent. may be annually injured *in the course of their routine work*, there is *not a single definitely allotted bed* in any of our general hospitals. We recorded recently with great pleasure that, under an arrangement made at the instance of Sir Edward Henry, the Commissioner of Police, with the approval of the Home Secretary, subscriptions from the police funds will be forthcoming equivalent to a sum of 1 guinea per week on account of every police in-patient admitted to any hospital during the year. This contribution, which is on a voluntary basis, is a valuable change in the methods of dealing with police in-patients in the metropolitan hospitals; but it seems to us that particular beds for the police might well be arranged for in these great institutions, unless, indeed, it should be found practicable to establish a small police hospital for the reception of the sick and injured of the force.

THE AERIAL CONVEYANCE OF INFECTION.

IN another column we publish an interesting article on this important subject by Dr. Frederic Thomson, medical superintendent of the North-Eastern Hospital, Tottenham, and Mr. Clifford Price. The question as to whether infection can be carried by the air has been much discussed, and although the atmosphere can scarcely be regarded as an important medium for the spread of diseases over long distances, nevertheless in the case of small-pox, and perhaps enteric fever, there is some evidence to suggest the disease may be carried by infected dust particles, probably fragments of dried discharges from persons suffering from the disease. Early in 1912 Dr. Thomson and Mr. Price commenced to make a series of observations in certain infectious diseases, using the most stringent precautions that the infection could not be carried by individuals who came in contact with the patients. The exact details are described in their communication, and prove that a patient and painstaking investigation was carried out. The diseases under treatment consisted of scarlet fever, diphtheria, rötheln, mumps, whooping-cough, measles, and chicken-pox. The arrangement of the ward was an interesting one, and as the result of their experience Dr. Thomson and Mr. Price assert that they could treat these infectious diseases in one ward, almost certainly, with perfect safety if the day of the disease on which the patients were to be admitted could be selected. The conclusions which were arrived at are stated with due caution. With regard to scarlet fever they consider that the infection is not air-borne. The evidence as to whooping-cough was uncertain, but in regard to measles they believe that the infection is probably carried by the air early in the disease only. The infection of chicken-pox also appears to be air-borne until the third day. The number of cases of other diseases which were treated were too few to be of any definite value. These observations are certainly interesting, and if corroborated by a larger number of cases would prove of considerable value.

PELLAGRA IN NYASALAND.

THE awakened interest in the problem of pellagra justifies reference to a recent paper by Dr. Hugh S. Stannus, medical officer at Zomba, Nyasaland, read before the Society of Tropical Medicine and Hygiene, and published in their Transactions.[1] To Dr. Stannus belongs the honour of discovering the existence and describing the symptomatology of pellagra as it occurs in that part of the world, and in this second communication[2] he amplifies his previous statements and supplies important data for a study of the etiology of the disease. During the last two years the spread of pellagra in and around the Central Prison at Zomba has been such that it amounts to an actual epidemic, in the course of which 131 cases have been directly under Dr. Stannus's observation. As far as the symptoms are concerned, stress is laid on the remarkable symmetry of the rash, which begins in these African cases usually on the antero-lateral surfaces of the upper third of the forearm, the anticubital fossa, and the lower third of the upper arm, appearing thereafter on the back of the hand, the triangles of the neck, the "butterfly" area of face, forehead, and upper surface of pinna. It is very common to find a condition like syphilitic rhagades at the corners of the mouth, where the epithelium becomes sodden and thickened, and cracks appear in it, passing across the mucocutaneous junction a little way into the mouth. A not infrequent affection of the free margin of the prepuce is exactly similar. There is often a glossitis with subsequent irregular epithelial denudation, giving an appearance described as "geographical" tongue. The whole mucous membrane of the mouth may be involved, and the process may spread to the fauces and pharynx. Dr. Stannus believes in the possibility of pellagra sine exanthemata, and quotes illustrative instances. The nervous system symptoms, the alimentary symptoms, and the numerous complications of the disease are described and tabulated, and then the writer proceeds to discuss the difficult matter of etiology. Six cases occurred among 27 warders employed in the prison, and 16 in some 150 men of the King's African Rifles, whose lines are close to the prison. On the other hand, none occurred in some 72 Sikhs, also stationed in the neighbourhood. The rations to prisoners, Sikhs, troops, and warders consisted mainly of rice, all drawn from the same supply. It is certain that in the case of many of the pellagrous prisoners maize has not entered into their diet at all for years. Dr. Stannus thinks that the data he adduces absolutely put all maize theories, as such, out of the question. On the other hand, if "grain" be substituted for "maize," then the theory is not to be so easily dismissed. At Zomba the prison ration consists of rice and salt, and in the majority of cases little or nothing else. It is therefore quite possible that so restricted a diet may lead to the appearance of pellagra as the expression of a deficiency, after the analogy of beri-beri. As the rice is eaten in Nyasaland, part at least of the pericarp is left on the grain. Dr. Stannus, however, shows that the risk of partaking of damaged rice is considerable. Turning to the theory of protozoal infection, Dr. Stannus has made a laborious investigation of the simulium distribution in Nyasaland in its bearing on Dr. Sambon's theory of the association of pellagra with the simulium fly. He has found the fly in abundance on all of the streams in the neighbourhood of Zomba, and frankly states that he can bring forward no facts to militate against Dr. Sambon's theory. At the same time, he points out that it must be carefully noted that the data brought forward equally support the theory which lays the cause of the disease at the door of malnutrition—i.e., nutrition wanting in some essential principle. Further, Dr. Stannus declares that in no disease caused by a living virus is a regular complete cessation of symptoms seen, with relapse at a definite season many months later, such as occurs or may occur in pellagra, and this leads him to believe that if the condition is associated with a protozoal infection there must be seasonal reinfection or intoxication, and not a relapse. Dr. Stannus's very careful clinical observations and investigations form a valuable contribution to the study of the disease.

INDEX CORRELATIONS.

IN connexion with the Lister Institute of Preventive Medicine a statistical study of index correlations has been undertaken by J. W. Brown, M. Greenwood, jun., and Frances Wood, particulars of which appeared in a paper in the *Journal of the Royal Statistical Society* for February last. The problem, which is of some importance in medical statistics, is of the following nature. In a series of districts with populations represented by z_0, z_1, z_2, &c., the deaths from a certain disease are x_0, x_1, x_2, &c., and from some other disease y_0, y_1, y_2, &c. The question arises whether there is any association between the x's and y's which is independent of the common relation of each with z. In order to obtain the requisite materials for this study the Report of the English Registrar-General for 1901 has been laid under contribution, the investigators having faced the very considerable labour of taking out from that source the first thousand registration subdistricts with populations between 1000 and 10,000, together with the corresponding numbers of births and deaths. The birth- and death-rates were then computed and the necessary correlation tables drawn up. These data were then completely analysed and the resulting constants appear in Table 10. The provisional conclusions derivable from this study are fully set forth in the paper, which will be found instructive and suggestive for further study of the problem.

ANAPHYLAXIS AND IDIOSYNCRASY.

SINCE the introduction of serum therapy the phenomena of hypersensibility and the "serum disease" have been closely followed and studied with absorbing interest. One of the latest original contributions to the subject is from the pen of Professor T. Silvestri, of the University of Modena, published in a recent number of *Il Policlinico*.[1] Whether there exist anaphylactic properties in certain drugs, or whether such properties are limited to albuminoid substances or are possessed by colloids in general and by certain crystalloids, are questions which have previously attracted the attention of other observers, such as Gubler, Bruck, and Klausner, while E. Friedberger and Ito attempted to produce hypersensibility to iodine in guinea-pigs by preparing them by injections of iodised albumin. Nicola Barbaro in a recent note on the determining action of certain crystalloid substances relates the case of a patient with acute polyarticular rheumatism in whom a small quantity of salicylate of sodium (30 grains daily) and minimum doses of iodide of potassium (4 to 8 grains) were followed by gastro-intestinal disturbance, diffuse erythema, pyrexia, and blood changes, and another case of a man, in whom the ingestion of fish gave rise to urticaria, who exhibited alarming symptoms after the injection of ⅙th grain of morphia. These phenomena may be of an anaphylactic nature, but as the anaphylaxis is not specific in each case it must be admitted that the anaphylactic state may have been prepared or merely brought into action by the morbid process and determined by the medicinal crystalloids. While waiting for more light to be thrown on such cases, it might be stated provisionally that the crystalloids do not give rise to antibodies, but that where the latter already exist they may determine anaphylaxis. In the present state of our knowledge concerning the anaphylaxis of crystalloids it may be affirmed that it does not yet rest on a solid basis of experiment, and that although we are not in a position to deny in an absolute manner the affinity, if not the identity, between the manifestations of idiosyncrasy for certain drugs and those of anaphylaxis, there is a tendency among scientists to recognise that at least some crystalloid bodies have a determinant action, direct or indirect. In all cases of idiosyncrasy the symptoms are those of poisoning by the respective drugs; the peculiarity of the case consists in the rapidity, and especially in the disproportion between cause and effect. Hence we do not speak of anaphylaxis in such cases, but of intolerance or idiosyncrasy towards the drugs used. When, however, we come to investigate the significance of true anaphylactic shock we are struck by the fact that whatever be the antigen used the symptoms are more or less identical. To explain this phenomenon it has been supposed that anaphylactic shock is the effect of the reaction between albuminoid antigen and antibodies in the presence of blood serum, the antigen undergoing a fermentative action with the formation of highly toxic products. But, on the other hand, Doerr has pointed out that fermentative actions are slow processes, while anaphylactic shock often takes place with lightning rapidity, and that the quantity of antigen sufficient to cause fatal shock is so small that it is difficult to imagine how, from the release of so minute a quantity of albumin, sufficient toxic bodies can be produced. Professor Silvestri, in criticising these views, advances the opinion that just as in true anaphylaxis, i.e., a poisoning of proteic nature, so in drug idiosyncrasy we have a group of symptoms whose peculiarity consists in the rapidity, violence, and disproportion between cause and effect, which reproduces exactly the symptoms of poisoning corresponding to the substance in question. Hence anaphylaxis and drug idiosyncrasy have essentially something in common, nor is it a valid objection that in the latter we cannot explain the mechanism of the accident caused by substances not biologically active, since we are in the same state of ignorance concerning those instances where the system becomes tolerant of and accustomed to large doses of poisonous drugs. It seems to Professor Silvestri still uncertain whether the field of anaphylaxis should be so far extended as to cover true drug idiosyncrasy, or whether experimental or spontaneous anaphylaxis should be considered simply a particular instance of idiosyncrasy in general. Anaphylaxis he considers a defensive reaction of ancestral origin against anything that threatens the integrity of the economy, either wholly or in part. It is for him a tumultuous reaction, disproportionate owing to a lack of adaptation to a given virus or given substance, a reaction which precedes immunity. It may be that the exceptional gravity of the diseases which rage for the first time in a given locality is in some cases an instance of anaphylactic reaction. In evolution, says Professor Silvestri, anaphylaxis must have preceded immunity, as it precedes it, as a rule, in experimental and clinical anaphylaxis. If at times it accompanies or follows immunity—at least in the laboratory, in animals which furnish a highly antitoxic serum, and which therefore have acquired a marked immunity with respect to a given infection—this fact is not in absolute contradiction to what has been just stated, for it may be assumed that by repeating the stimulus (injection of toxin) for too long a time the organism would respond with a paradoxical reaction. This would constitute another argument in favour of the theory of the identity of anaphylaxis and idiosyncrasy in general.

JAUNDICE OF PREGNANCY WITH JAUNDICE IN THE OFFSPRING.

A REMARKABLE case is recorded by Dr. F. E. Tylecote in the *Medical Chronicle* (1914, p. 465) of a woman who married at the age of 18 in 1894, and who has since then had eight children. Each child was born prematurely, the first at six months, the second at seven months, and the remainder at eight months. With each pregnancy the woman had jaundice which came on at the third month, increased in intensity, persisting till three months after confinement, and was unassociated with any pain. Its onset was always insidious. She had never before had jaundice. Of the eight children seven had jaundice; this came on in six a week after birth; in the other, in two days. Six of the children died, all with convulsions, at ages varying from two days to nine months; the only child which recovered and which is still living was the fifth; like the rest it had jaundice when a week old. It was breast-fed for ten days from birth, an interesting fact, as all the other children were artificially fed. The only child which escaped jaundice was the first-born, which only lived an hour, and it is stated that in these familial jaundice cases immunity of the earlier children is common. The woman herself in 1910 had persistent jaundice accompanied by a marked xanthomatous condition which had started on the fingers and hands 14 years *after* the first attack of jaundice, which suggests the latter condition is not dependent, in this instance at any rate, upon xanthomatous nodules in the liver. She had a markedly enlarged liver, and there was bile in the urine. There was no pyrexia. The jaundice was deep, and during observation in hospital in 1910 was not variable in intensity.

CHLOROFORM ANÆSTHESIA AND ADRENALIN.

THE general conclusion has been reached that though in some cases of death under chloroform anæsthesia the death is due to overdosage, in many others this is not the cause. Death has occurred frequently under light anæsthesia, often at the early stages, and sometimes when the anæsthesia has been interrupted and variable in intensity. When direct and careful observation has been made under conditions naturally militating against exact and scientific methods, it has been noted that it was the heart which failed and not the respiration. In cats under light anæsthesia A. G. Levy has noted the frequent incidence of cardiac irregularities and often sudden death. The latter was demonstrably due to ventricular *fibrillation*. It is suggested that this is the cause in clinical cases, and with much reason. Of the preceding irregularities and their relation to the final consummation, ventricular fibrillation, it was shown that they arose from an "irritable" ventricle, a ventricle giving rise to frequent extrasystoles and sometimes tachycardia. The intimate relation of such to fibrillation is sufficient to suggest that the latter is merely a further advance upon the *former*. Incidental to Levy's observations it was noted that the injection of small doses of adrenalin favoured both the irregularities and the onset of fibrillation. This was shown by the fact that even under deep chloroform anæsthesia its injection caused *similar* arrhythmias to those seen, without its addition, under *light* chloroform dosage. The practical value of these observations is obvious, and has been intensified by the recent clinical fatalities which have followed the administration of chloroform after local adrenalin application. More exact knowledge of this drug's action and its relation to light chloroform anæsthesia has been furnished by the admirable researches of E. Nobel and C. J. Rothberger, published in the *Zeitschrift für die Gesamte Experimentelle Medizin* (1914, Band iii., p. 151). These results, in the first place, confirm those of Levy with regard to the effect of adrenalin, but they differ from his view that increased "irritability" of the heart is the cause. Rather do they believe that the irregularity is due to simultaneous stimulation of the extracardial nerves, the vagus and the sympathetic. They noted that the "irritability" is depressed by chloroform, vagal central action is rather increased, and adrenalin acts much more easily when the vagi are intact. In one experiment standstill of the heart was induced by adrenalin and chloroform when the vagi were intact, a result never gained with divided vagi. This shows the effect of adrenalin upon the vagus, whose sensitiveness is, it is suggested, heightened by the chloroform. The heightened vagal tone is shown in most of the experiments (performed upon cats and dogs) by a primary bradycardia. There is sinal slowing. A further vagal effect follows. This is depression of *a.-v.* conductivity, leading even to complete dissociation of auricles and ventricles. With suitable strength of adrenalin further effects are noted, and these are due to accelerator stimulation. These effects are seen in frequent ventricular extrasystoles or tachycardia, arising usually, but not always, in the left ventricle, and often preceded by a brief period in which the node of Tawara (the secondary centre) controls the rhythm of the heart. Where sudden death occurs it is at this stage, when the tachycardia may break into fibrillation, or when the latter arises *de novo*. With recovery from the tachycardia there occurs a "secondary bradycardia." This is due to nodal automaticity, a condition only rendered possible by associated sinal depression, the persisting vagal effect. The irregularities, then, observed under light chloroform anæsthesia with adrenalin follow a definite plan. It is a plan explainable by synchronous vagal and accelerator stimulation, and in this respect follows strikingly the experimental effects following direct and combined stimulation of these nerves. Of practical importance is another fact elicited and explainable—namely, that previous injection of atropine, by cutting off vagal effects, renders irregularities less easy to produce. This it does in one way by maintaining the normal sinal dominance of rhythm. Atropine later in the experiment has not the same effect—in fact, may be dangerous. In cases, then, which require adrenalin and chloroform a preliminary injection of atropine is strongly advisable. The observations afford an explanation of facts previously seen clinically as well as experimentally, and indicate in a striking manner the practical application of the string galvanometer, by which alone could the interpretation of events be effected.

LEUCOCYTOSIS OF THE CEREBRO-SPINAL FLUID WITH MENINGEAL SYMPTOMS IN CEREBRAL HÆMORRHAGE.

AT a meeting of the Société Médicale des Hôpitaux of Paris on May 1st M. J. Amaudrut and M. A. Gendron reported two cases of cerebral hæmorrhage accompanied by conditions which have rarely been observed—leucocytosis of the cerebro-spinal fluid and meningeal symptoms. A man, aged 38 years, was taken to hospital on Oct. 7th, 1912, suffering from coma and right hemiplegia which began five days before. He had previously been quite well. On the paralysed side the plantar reflex was extensor, the patellar and tendo Achillis reflexes were abolished, and the radial and olecranon reflexes were increased. There were also meningeal symptoms; Kernig's sign was well marked on the sound side, the neck was rigid, and when the head was briskly flexed on the chest flexion of the left thigh was produced. There was no albumin or sugar in the urine, and the Wassermann reaction was positive. However, mercurial treatment was adopted. The patient remained in this state until the 16th. On the 19th he was sufficiently conscious for the existence of complete aphasia to be observed. The meningeal symptoms gradually diminished. On several occasions lumbar puncture was performed with similar results. On the 9th the cerebrospinal fluid was found under increased tension, of an amber colour and turbid. It contained 688 leucocytes per cubic millimetre, which consisted of 88·3 per cent. of polynuclears, 9·3 of lymphocytes, and 2·3 of mononuclears. Cultures of the fluid were sterile and inoculation of a rabbit negative. Recovery ensued. In the second case a man, aged 30 years, the subject of plumbism, was taken to hospital comatose on Sept. 26th, 1912. There was right hemiplegia. He had had a "stroke" during his work. He remained in this state for 48 hours, and on the morning of the 28th, when he became conscious, he was found to be aphasic. In the evening he again became comatose, and in addition to the hemiplegia meningeal symptoms were found. The neck was rigid and Kernig's sign was present on the left side. There was optic neuritis and the urine contained albumin. Lumbar puncture was performed several times. On the 26th the cerebrospinal fluid had the rose-colour of hæmorrhage. On the 28th it was of an amber colour and contained leucocytes in abundance. They were almost all intact polynuclears. There were no red corpuscles. Death occurred on the 30th. The necropsy showed an encysted hæmorrhage which had destroyed the left internal capsule and part of the grey nuclei.

LESIONS OF THE CAUDA EQUINA.

HIDDEN away as it is from most investigators, even from the enterprising surgeon of the twentieth century (whose researches lead him into districts that the pathologists of past generations were content to leave unexplored unless there were special reasons for going there), the cauda equina has hitherto received something less than its due share of attention. However, this is going to be changed, as two papers in the April and May numbers of the *American Journal of the Medical Sciences* show. The first, by Dr. Joseph Collins and Dr. C. A. Elsberg, describes recently observed cases of giant tumours encountered in this area. These tumours, they say, seem to originate in the pia over the roots or from the roots themselves; they grow slowly, causing few symptoms until they have attained such a size that they fill the entire lower part of the spinal canal, extending upwards over the conus and the lumbo-sacral cord. Three such cases are described, in the first of which the diagnosis was suspected, while in the other two a correct diagnosis of giant tumour of the cauda equina was made before the operation. In spite of this diagnostic accuracy the results of operation were not very good; two of the patients were considerably relieved, but it was impossible to effect a complete removal of the growth. The writers think that an earlier diagnosis would offer some hope of a radical success. As they point out, their patients' histories presented a long period of premonitory symptoms, chief among which were pain in the small of the back, extending sooner or later into one and then the other lower limb, and leading to a diagnosis of sciatica, stiffness of the lumbar back, increasing stiffness and weakness in the lower limbs, with drop-foot, and slight sphincter disturbances. To these data objective examination added the discovery of paralysis of the peronei and sometimes of the anterior tibial group, absence of the knee- and ankle-jerks, tenderness of the lower lumbar spines, irregular and asymmetrical sensory disturbances, and absence of cerebro-spinal fluid or of characteristic changes on lumbar puncture. The tumours removed were endotheliomata or endothelial sarcomata; they were relatively benign and did not tend to extend through the dura. The second paper, by Dr. Foster Kennedy, Dr. C. A. Elsberg, and Dr. C. I. Lambert, emanates from the same source, the New York Neurological Institute. In it the authors describe what they regard as a new morbid entity. This belief is based on observation of five cases so closely resembling one another, and so different from anything hitherto described, that it seems to be well founded. The symptoms were pain in the lower limbs, especially in the backs of the thighs and the calves; atrophy of the anterior tibial muscles, with drop foot; objective sensory phenomena most marked and severe in the areas supplied by the sacral roots; loss of knee-jerks, and (in three cases) a plantar extensor response. At the laminectomies which were performed in every instance the caudal roots were found to be swollen, congested, and bluish-red in colour. Pathological examination showed these appearances to be due to a meningo-radiculitis which was not syphilitic or tuberculous in character, but which is very suggestively compared by the authors to a similar condition found in horses, and to the phenomena produced experimentally in these and other nerve roots by bacterial toxins ascending from the periphery into the central nervous system along the nerve trunks. In these human cases, however, no source of infection of this kind appears to have been discoverable.

SEASONAL CHANGES IN THE HEALTH OF THE CONSUMPTIVE.

THE popular belief that the summer months are the most favourable for the consumptive is, no doubt, largely founded on the observation that coughs and colds are so much more frequent in the winter than in the summer. But even when the non-tuberculous conditions are excluded it would seem that the prevailing belief in the salubrity of the summer months is founded on fact as far as consumption is concerned. This view has lately been confirmed and amplified by Dr. N. J. Strandgaard, whose investigations, communicated at a meeting of the Medical Society of Copenhagen, have been published in *Hospitalstidende* of April 1st. It is the practice for patients in the Danish sanatoriums to be weighed every Saturday morning, and the average gain of weight is between 200 and 300 grammes. To be exact, the average is 270 grammes, which is the figure given for eight sanatoriums with an average total of 800 patients during a period of 10 years. The average gain of weight varies much with the season of the year. From December to May it is fairly uniform but low, being 225 to 250 grammes. It rises rapidly and steadily from May to September, during which month it reaches the maximum of 380 grammes. It falls from October to December, which is the month showing the smallest gain of weight. The average gain of weight in September is almost double that in December, and there can be little doubt that gain in weight is, as a rule, accompanied with improvement in the patient's health. Thus at Boserup, one of the Danish sanatoriums, it was noted during an observation period of 10 years, that the proportion of febrile patients confined to bed was about twice as great in the winter as in the summer months. The proportion of patients without expectoration and bacilli was greatest in August and September, least in the months January to April. Among the factors responsible for the seasonal changes in the patient's weight are the atmospheric conditions. In one week in the summer of 1908 the average for five sanatoriums actually showed a loss of weight, whereas there had been a substantial gain of weight during the preceding and following weeks. During these weeks the humidity of the air had been high; during the middle week it had been low. This relationship is further illustrated by the uniformity with which the average gain of weight curve follows that of the relative humidity of the atmosphere. The warmth of the air also seems to affect the patient's weight, for the atmospheric temperature was 2° C. higher during "heavy" than it was during "light" weeks. Dr. Strandgaard suggests that these observations point to sunlight, warmth and moisture being fattening, while darkness, cold and dryness would appear to be relatively emaciating. His observations on the relation of the consumptive's weight to the seasons of the year show a striking similarity to the results obtained by Bondeson and Jörgenson in connexion with soldiers, by Adsersen and Milo in connexion with the new born, and by Malling-Hansen in connexion with older children. Finsen's investigations into the amount of hæmoglobin in the blood during the seasons of the year also tally with Dr. Strandgaard's conclusions. These are instructive, but it should be borne in mind that they are based on statistics, and are not applicable to the individual. Probably in no disease so much as in consumption is the familiar adage true—"One man's meat, another man's poison."

THE INTERNATIONAL CONGRESS OF OPHTHALMOLOGY.

The Twelfth International Congress of Ophthalmology will be held at St. Petersburg, under the presidentship of Professor Bellarminoff, from August 10th to 15th. Arrangements are being made by which members can get from London to St. Petersburg on advantageous terms. Mr. W. H. H. Jessop, 73, Harley-street, London, W., who is in charge of the negotiations, will be glad to afford any necessary information as well as to receive the names of those intending to be present at the congress.

Mr. Alexander G. R. Foulerton, F.R.C.S. Eng., has resigned his appointment as Director of the Bacteriological and Clinical Pathology Laboratories at the Middlesex Hospital, and has been appointed to a lectureship in the Public Health Department of University College, University of London.

THE Cavendish Lecture will be delivered by Dr. F. W. Mott, F.R.S., before the West London Medico-Chirurgical Society on Friday, June 19th, at 8.15 P.M. in the Kensington Town Hall, on the Causes of Insanity. The lecture will be followed by the annual conversazione.

Dr. T. R. Elliott, F.R.S., will deliver the first biennial Sydney Ringer memorial lecture on Monday next, June 15th, in the lecture theatre of University College Hospital Medical School, at 5 P.M., on the Adrenal Glands. The lecture is open to all qualified medical practitioners and medical students.

Dr. Edwin Goodall will deliver the Croonian lectures before the Royal College of Physicians of London on Tuesdays and Thursdays, June 18th, 23rd, 25th, and 30th, at 5 o'clock, at the College, Pall Mall East, on "Modern Aspects of Certain Problems in the Pathology of Mental Disorders."

PREHISTORIC MAN AND HIS EARLY EFFORTS TO COMBAT DISEASE.*

BY T. WILSON PARRY, M.A., M.D. CANTAB.

The Stone Age.

THE Stone Age must be regarded merely as a stage of culture, as every nation and people on their emerging from an animal to a human level, however low, starts with its "Stone" Age, passes through its "Copper" or "Bronze" Age, thence through its "Early-Iron" Age, till it eventually arrives at its Historic period. The anthropological world is indebted to the late distinguished antiquarian, Lord Avebury, for suggesting the division of the great Stone Age into two parts—namely, the Palæolithic or Old Stone Age and the Neolithic or New Stone Age.

Palæolithic man was a hunter living at first on the banks of rivers ("river-drift man" he was then called); then he took to dwelling in caves (cave man). We find him in this last capacity as an artist, showing much ability and even some genius.

Neolithic man was of a different type. I think he may best be described as a farmer, a builder, and a surgeon. The Neolithic period is divided into three parts: (1) the Campigny period, (2) the Robenhausen period, and (3) the Carnac period. It is this last period that will specially interest us now, as we have absolute and certain proof that during this period the surgical operation of trephining was performed.

Pre-palæolithic Man.

To begin at anything like a beginning we must hark back to times much more remote than these. In pre-palæolithic days man was little above the lower animals. The picture that I have of the earliest primitive man at present is an admixture of Pithecanthropus erectus and the Piltdown lady. With the former's cranial capacity of 850 c.c. and the latter's simian lower maxilla and canine tooth, we are getting dangerously near our cousins the anthropoid apes. A large male gorilla may have a capacity of 600 c.c., and there would therefore be much less distance between him and "the fossil man of Java" than exists between this latter and an average modern European cranium. I need not enter into the controversy as to whether these fossilised human crania belong to the early Pleistocene or late Pliocene period. The geologist has strong inclinations towards the former, while the anthropologist has much to say on the latter. I have faith that there are still to be unearthed anatomical surprises of unparalleled importance which when discovered will necessitate a constant rearrangement of ideas as fresh material is brought to light.

---

* An abstract of a presidential address delivered before the North London Medical and Chirurgical Society on May 13th, 1914.

Animals' Self-curative Instincts.

It is well known that animals possess strong self-curative instincts. Dogs and cats when indisposed will eat grasses that have a medicinal action usually of an emetic or purgative nature. The fibrous-rooted wheat-grass,[1] *Triticum caninum*, is frequently eaten by the former. If an animal has been injured it is noticed continually to lick the affected part, which is a somewhat crude combination of our modern fomentation and massage. Prehistoric man would most certainly have licked his wounds. Later, when he had lost some of his earliest animal instincts, he would observe what animals did and imitate them. Thus the use of hellebore[2] was believed to have been discovered from the goat.[3] Virgil tells us that dittany was "eaten by wild goats when they were shot with darts."[4] Pliny tells us that bleeding was taught man by the hippopotamus, "that intelligent animal finding himself plethoric, goes out on the banks of the Nile and there searches about for a sharp-pointed reed, which he runs into a vein in his leg, and having thus got rid of a sufficient amount of blood closes the wound with clay." Buffaloes, horses, and camels are exceedingly fond of licking salt. Prezevalsky says: "On the Mongolian camels salt, in whatever form, acts as an aperient, especially if they have been long without it." Livingstone says that "the chimpanzee, soko, or other anthropoid apes will staunch bleeding wounds by means of their finger or of leaves, turf, or grass stuffed into them." Primitive man must have done likewise, only always a little more.

The Instinctive Period of Medicine.

The first period in the history of medicine is known as the Instinctive Period or the Period of Demonology. As embryology epitomises evolution, so the study of the present-day primitive savage unfolds to us the larger history of prehistoric man. It was no doubt the twin mystery of disease and death that first stimulated man to think, that is why the medicine-man and the priest were one and the same individual at the outset. The position of the medicine-man in the tribe must have been a most exalted one. In a fascinating book just published on the American-Indian, called "The Vanishing Race,"[5] this is well shown. "The Indian," it says, "aspires to be a great hunter, he seeks fame as a noble warrior; he struggles for the eagle feathers of distinction, but his greatest longing is to become a medicine-man and know the great mystery." Witchcraft and magic early took a chief part in the treatment of disease and demonology reigned supreme for many millenniums. Demonology is based on "Animism," and this latter briefly consists in the belief in the influence of the spirits of dead persons. Animism has its beautiful as well as its hideous aspect. The wide belief among savage races that inanimate objects, as well as animate beings, are all possessed of a spirit has been well demonstrated by Maeterlinck's excellent allegory "The Blue Bird," which shows the happy side of this creed. The unhappy side is illustrated by the reverence bestowed on spiritual monsters and the propitiation required of them. The three chief theories of disease were: (1) the anger of a disaffected spirit, (2) witchcraft, or (3) offended spirits of dead persons. The Mantira,[2] a low race of the Malay Peninsula, believe that there is a separate disease-spirit for every illness, one for small-pox, one for inflammation of the hands and feet, and one for hæmorrhage; in the last-named case the spirit is thought to fasten itself on the wound of the individual and suck out his blood. The aboriginal New Zealanders[6] had a separate demon for each part of the body to cause disease: Tonga caused headache and sickness; Moko-Tiki was responsible for chest pains, and so on. In Brittany to-day similar pagan ideas are universally accepted, but under different auspices. The Breton's deities are neither Tonga nor Moko-Tiki, but if the Bretons are suffering from boils they offer prayers to St. Maudez; if from fevers they petition St. Gonéry.[7] The earth from the tomb of this latter saint is considered a cure for any kind of fever. It is sold in little muslin bags and tied round the necks of the patients.

Demonology the Reason for Trephining.

It must have been but a short step for the first man, who, firmly believing in demoniacal possession and who, at the same time, suffered either from frequent fits, severe pain in the head of a periodic or paroxysmal nature, chronic hemicrania or unbearable Ménière's disease, to make an effort to free himself from his fetters. Life had become an intolerable burden to him, and he believed there was a devil inside his cranium that was petitioning somewhat persistently for liberty. The first operation must have been troublesome and tedious, not to mention its extreme danger. The medicine-man had to incise the scalp with a sharp piece of flint, arrest the bleeding, and scrape the bone. This would take many hours to perform, but the patient was helpful and anxious to get rid of his devil, and possessed that unflinching stoicism to pain that is characteristic of the savage. If the patient recovered he was reverenced as a hero. If he died his skull was eagerly sought after. The trephined portion was removed by flint saws and pieces of bone, edged by part of the healed cicatrix, were removed. Either a hole was passed through this or a groove made for affixing a cord, so that it might be worn as an amulet to defend the wearer against the disease from which the dead man suffered. The first skull of this kind to which the attention of scientists was drawn was discovered by M. Prunières in the year 1868 in a dolmen near Aiguières. This observer mistook the hole with the smooth edges for an opening that had been made artificially after death for the lips, in the conversion of the skull into a drinking cup, a custom well recognised among savage tribes. It was left to Professor Broca to interpret this, and he showed indubitably that the hole in the skull had been made during life and had been done by scraping.[8]

Neolithic Trephining in Great Britain.

It might have been thought, considering the number of trephined skulls that have been unearthed in France, that the custom would have spread to the British Isles, as only the Channel separated the two countries, and we have evidence

DESCRIPTIONS OF ILLUSTRATIONS.

FIG. 1.—Skull of female (21 years) trephined by flint flake. Time taken 30 minutes.

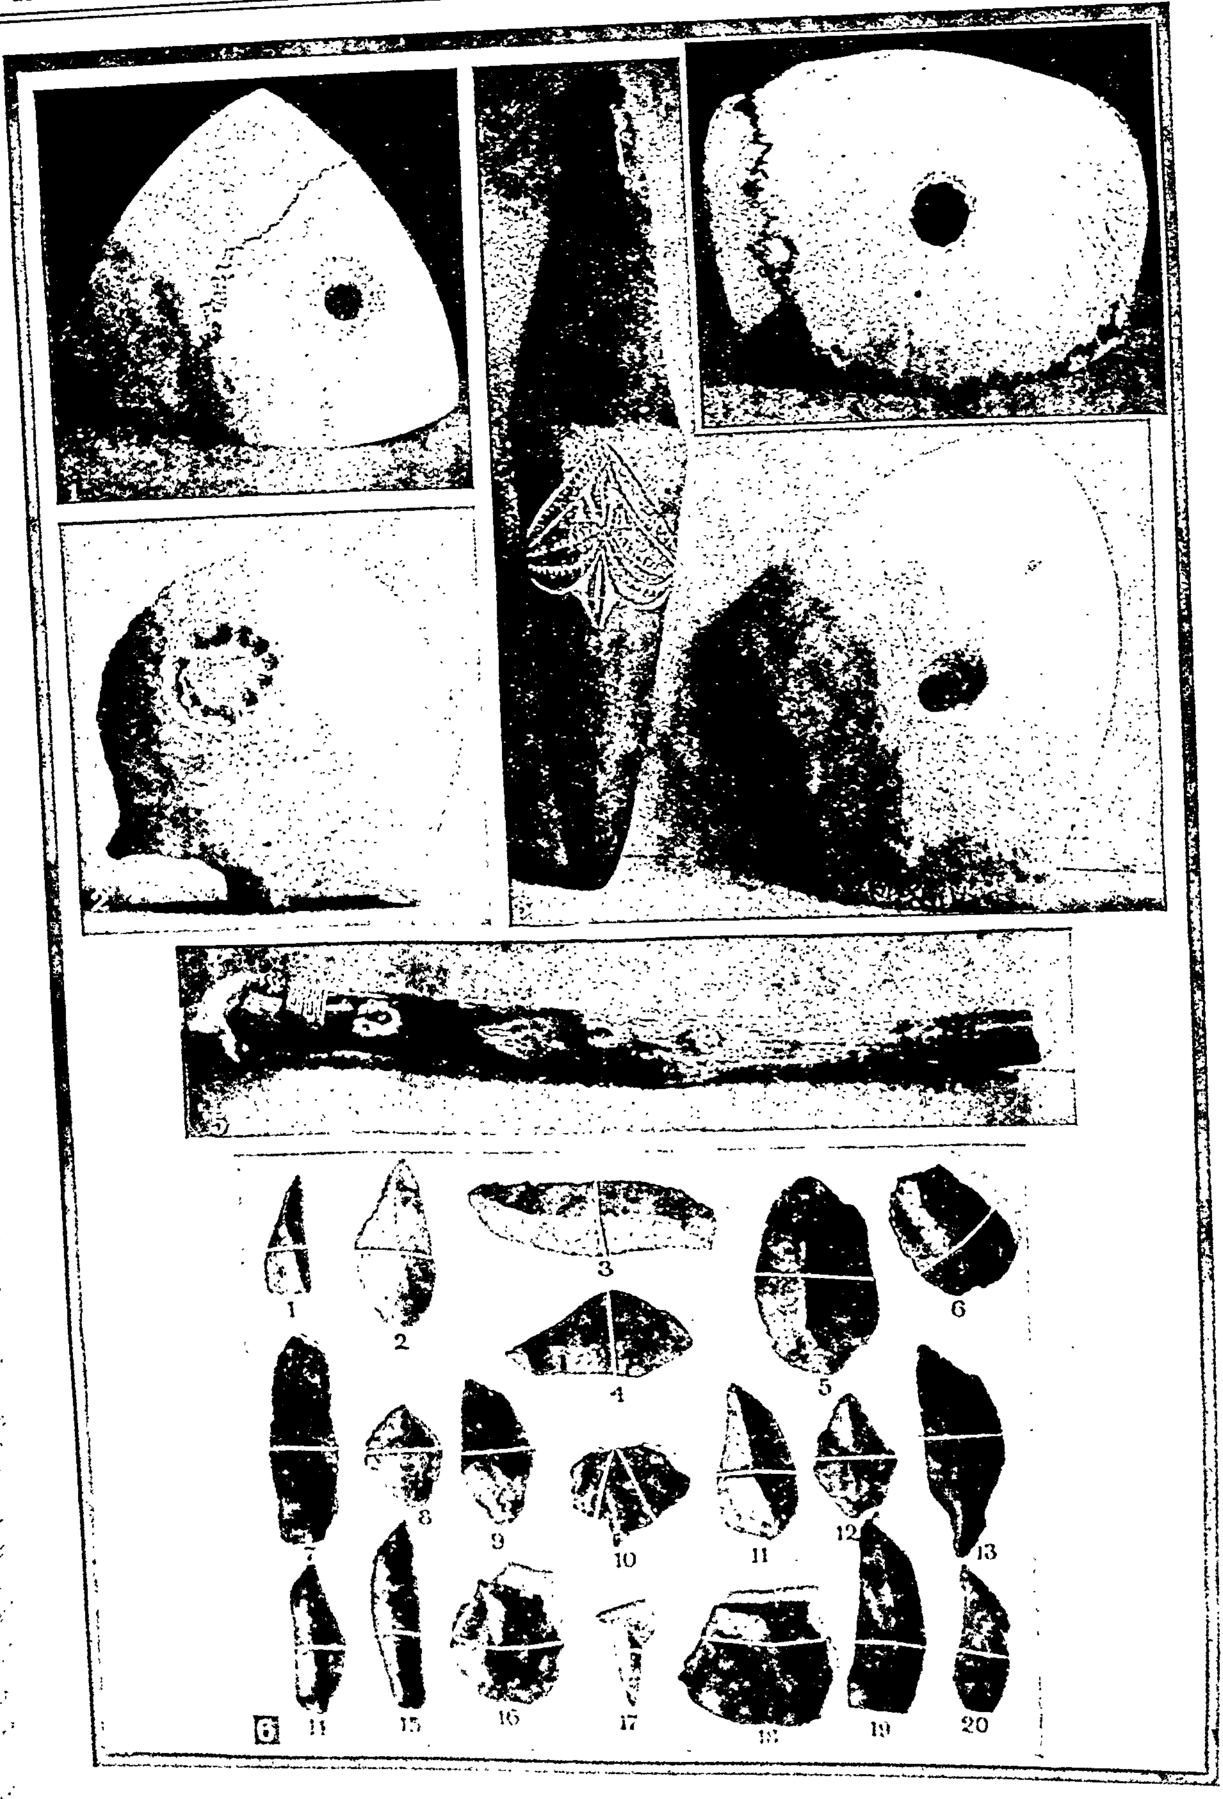
FIG. 2.—Dry skull partially trephined by shark's tooth. Time taken 1½ hours.

FIG. 3.—Skull of male (44 years) trephined by obsidian knife (Admiralty Islands). Time taken 30 minutes.

FIG. 4.—Skull of infant (16 months) trephined by flint flake. Time taken 15 minutes.

FIG. 5.—Hafted shark's tooth.

FIG. 6—Selected Neolithic flint flakes and borers (Coleraine). No. 20 was used in trephining skulls (Figs. 1 and 4).



Illustrations Representing Experiments of Different Kinds of Primitive Trephining with Tools used.

that no inconsiderable amount of traffic existed between the shores in Neolithic times. I have only been able to hear of three such skulls that have been discovered in this country, and would be most happy to be informed of any other specimens should they exist. The three specimens of which I know are the following: 1. A skull that was dredged from the bottom of the docks at Port Talbot, South Wales, in or about 1870–72. I have a photograph of this skull, which has been kindly lent to me by Mr. Thomas Gray. This skull shows a frontal excavation over the right supraorbital region. 2. An interesting specimen showing a ring-trephine, as if an effort had been made to remove a rondel of bone. This specimen was excavated in the autumn of 1863 from a long barrow, near Bisley, by the late Dr. W. H. Paine, assisted by Dr. Henry Bird. I have to thank Mr. A. E. W. Paine, son of the first-mentioned excavator, for kindly furnishing me with a photograph. Professor Arthur Keith, who has seen this specimen, states that "there is no mark of inflammation or disease on the bone." This probably belongs to the Bronze Age. 3. The third specimen is in the Northampton Museum. I can emphatically state that the three trephine holes in the form of a triangle, on the vertex of this skull, were not made during the Stone Age nor by any Stone-Age implements. All that is known of this specimen is that it was found "outside the British Camp called Hunsbery" in Northampton. On a modern skull I have made as exact a model as I can of the three holes, as regards size and relative position, and it is my opinion that they were made on the original not from any demonological reason, but as a means for suspending the skull as a trophy by a Bronze Age or later headsman. I have to thank Mr. Thomas J. George, curator of the Northampton Museum, for his kindness in sending me tracings[9] of General Pitt-Rivers's plates of this skull. It is probable that only one of these three specimens alluded to above is Neolithic.

Melanesian Trephined Skulls.

In the Museum of the Royal College of Surgeons of England are six skulls of modern Melanesians that have been either partially or wholly trephined by natives of those islands. In three of these specimens a complete perforation has been made in the cranial bones, and in the remaining three either the outer table alone or the outer table and diploë have been removed. One, a male from New Britain, has a large hole measuring 28 mm. by 34 mm. in the right occipito-parietal region. The outer edge of this hole is thin, bevelled and smooth, and shows a healed surface, demonstrating a successful operation. Of the five other skulls, all of which came from New Ireland, one shows two frontal scrapings. On the left side the outer table has been completely rubbed through and on the right is a circular scraping leaving a boss of bone in the centre, which looks as if an attempt had been made to remove a small rondel of bone. In the third skull is a beautifully rounded perforation measuring 14 mm. by 15 mm. in the left frontal region. The edges of this hole show perfect healing. There is a diseased patch of bone with considerable erosion in the mid- and right-frontal region which demonstrates the obvious reason for this operation. The fourth skull is similar to the last in the fact that a large scraping (17 mm. by 28 mm.) has been made, probably as a direct counter-irritation to relieve severe or continuous headache, in front of an extensively diseased area of bone. In the fifth skull there is a large elliptical scraping, 48 mm. by 35 mm., in the right parietal region. A deep furrow in the centre of this scraping illustrates the method by which this was done. In the sixth and last specimen there is a large perforation, 23 mm. by 40 mm., over the left frontal region, and part of this hole is filled up with fresh callus formed during the process of healing. All the cases have undoubtedly been done by scraping the bone with obsidian flakes. In Melanesia after the operation has been performed the scalp is replaced and simply bound into position by a bandage made of banana fibre. My thanks are due to Professor Keith for his courtesy in permitting me to describe these specimens in this paper.

Neolithic Methods of Trephining.

Being anxious to ascertain how Neolithic man trephined living subjects with the crude materials at his disposal, I made a series of some 19 experiments both upon recent and dry skulls. (See illustrations.) When showing the results of some of these experiments to Professor Keith he informed me of a pamphlet by the late Dr. Lucas-Championnière[10] in which I would find that several of my experiments had already been done by him. I was quite unaware of this brochure when making my tests. Referring to this pamphlet it appeared to me that Dr. Lucas-Championnière had only experimented with flint. The materials I used besides flint were obsidian, shark's teeth, shell, and slate. Flint I used both in the form of Neolithic scrapers and as a hafted sharp point to a bow-drill. This bow-drill, I may mention, is one of the oldest forms of mechanical contrivance. Obsidian I also used in two ways—first as an ordinary flaked scraper, and secondly as a hafted implement in the form of an Admiralty Island knife. I used two kinds of shark's teeth—a small variety, for an infant's skull, was obtained from the King's Mill Islands, and was identified by Mr. C. Tate Regan, of the Natural History Museum, as belonging to "*Carcharias glaucus* or a related species," while the larger specimen, which I used for adult skulls, was *Galeocerdo arcticus*. The shells I used were beach-worn specimens of *Ostræa edulis*.

For scraping a hole in bone, metal not being considered, there can be no better natural implement than a well-flaked piece of flint. When flint cannot be obtained, as in volcanic regions like the South Pacific Islands, obsidian makes a good substitute. Obsidian is a natural volcanic glass and can be flaked, in the same way as flint, by a sharp well-directed blow. Contrasting these two substances I would give flint the first place. A hard, sharp edge can be obtained in flint which is more resistant to counter-pressure than is obsidian. Both flint and obsidian when freshly flaked are excellent substances for surgical purposes by virtue of their smooth surfaces, which would be aseptic. The method I employed for scraping the trephine-hole in both flint and obsidian was the following. With a suitable flake I scraped as nearly as possible along a single line. This line I gradually converted into a groove, which soon showed two more or less prominent edges. With a curved movement of the scraper I next attacked these edges until a depression had been produced in the bone which gradually assumed an elliptical shape. It was now only a question of time and manipulation to convert this elliptical depression into a circular one, and thence, having penetrated the inner table of the skull, to expose the dura mater and enlarge the foramen to the size and shape required. As regards the bow-drill I bored a succession of holes, some fifteen in number, in a circular manner on the site chosen. These I enlarged till they touched one another. The next step was to break down the edges between them with a sharp, strong flake, and then by means of sawing and scraping eventually to remove a complete rondel of bone. This is an extremely tedious and clumsy operation, and not in any way calculated to bear comparison with the simpler method of scraping. As regards sharks' teeth as surgical instruments, I am satisfied that there is no more excellent natural implement for boring holes in bone than a hafted shark's tooth. Its keenly serrated edges and its strong, sharp point make it an instrument invaluable to the primitive surgeon. It moreover possesses a natural flange which converts it into a trephine of undeniable utility, for the flange is so placed as to prevent the point penetrating too deeply to the wounding of the dura mater. A ring of holes (as in the case of the bow-drill), packed as closely as possible, followed by breaking down the bridges between them, makes a hole (after removal of the rondel) as clean and neat as the most fastidious chirurgeon could wish. Trephining by shell was probably never attempted by Neolithic man in Europe, though primitive man in the South Pacific Islands certainly used shell for this purpose, and shell knives and lancets for opening abscesses. It took me nearly 25 minutes to trephine the skull of a 9 months old infant, which in time bears most unfavourably with the same operation on a 14 months old child which only took 9½ minutes, or on a 16 months old child, which took 15 minutes. I used slate in one instance, but it took me nearly 50 minutes to make a small hole in the skull of a man of 44 years. The originals of my experiments are exhibited in the Historical Medical Museum, and I have to thank the curator, Mr. C. J. S. Thompson, for his kind loan of aboriginal trephined skulls.

Conclusion.

We have been looking back into the far-away past and have been endeavouring to piece together the history of prehistoric man from specimens of his handiwork that have been heirloomed to us by the sheltering hand of Nature, who has protected them for us either by covering them over with the débris of rock or hiding them under stalagmite or in the deep breccia in the floors of caverns. To this has been added a passing glimpse at the methods of present-day primitive tribes. Tylor says[11]: "The uniformity which so largely pervades civilisation may be ascribed, in great measure, to the uniform action of uniform causes." Thus it is that the combination of these two parallel studies enables us to get a true insight into the life of prehistoric days.

Sir George Reid, High Commissioner in London for the Commonwealth of Australia, will distribute the prizes to the successful students at Guy's Hospital Medical School on Thursday, July 9th.

THE NEW SCHOOL OF PHYSIOLOGY AT CAMBRIDGE.

On Tuesday last H.R.H. Prince Arthur of Connaught opened at Cambridge the new school of physiology, which has been presented to the University by the Drapers' Company.

The New Building.

The admirable building, designed by Sir Thomas Jackson, is erected on a site contiguous on one side with the existing laboratory of experimental psychology and on the other with the site allocated to a laboratory of biochemistry, for which the building fund has yet to be obtained. In this way the three great sections of physiological study will be housed in that intimate connexion with each other which modern developments demand, while the beautiful irregular quad of new schools, built on what was formerly a section of Downing Park, takes one step further to completion.

The building is five storeys in height, of the same purplish-red brick as the other schools, relieved with lighter brick adornments and stone dressings, and presents from the outside a businesslike as well as dignified appearance. On the ground floor, in addition to the store-rooms, battery and switch-board rooms, place is found for the electro-physiological department, for an aquarium used in the tank-storage of the marine invertebrates, and for the research rooms in thermo-electricity, where the measurements of the evolution of heat from the tissues can be taken and the influence of diets in this direction estimated. In the electro-physiological department large provision has been made for the study of the electric stimulation of muscles and nerves, and of the electric phenomena which accompany their action. Compressed air can be distributed for use in various manners throughout the building, while all the latest devices in electrometry are provided, including a capillary electrometer, in which vibration has been eliminated while the variations can be registered by photography, a string galvanometer, and a pendulum delivering electric shocks at small intervals of time. On the first floor are situated a large theatre, the professor's rooms, and six private research rooms, with the usual accommodation for weighing, photography, and cold storage. The theatre will allow of a demonstration to a class of 80, and the adjoining room contains a kinematograph. The library is also situated on this floor. The second floor is arranged for the study of the digestive and respiratory system, with rooms allotted for neurological research and research into the special senses and colloids. Three rooms have been designed for the study of respiration, especially with regard to the capacity of the blood to absorb oxygen and carbonic acid. Four mercurial air-pumps are provided in which the blood can be boiled *in vacuo*. In another type of apparatus the gases in small quantities of blood—a few drops—are estimated by expelling the gas from the blood on shaking it with appropriate reagents in a bottle fitted to a gauge. In the centre of the room containing this apparatus are gasometers containing gases of known composition. These gases can be put in suitable flasks and blood exposed to them at a known temperature in order to find the quantity absorbed. There are also on this floor private rooms for the staff, two more private research rooms, a photographic room, and the X ray department. On the two upper floors are large rooms for classes in histology, the fourth floor having a second and smaller theatre accommodating 50 students. In the large histology room with its galleries 150 students can work simultaneously. Throughout these floors the students are supplied with every new mechanical device.

The Opening Ceremony.

The proceedings commenced in the morning in the Senate House, when Lord Rayleigh, the Chancellor of the University, introduced to the Senate Colonel S. M. Benson, the Master of the Drapers' Company, who made a formal gift of the building to the University. Prince Arthur of Connaught then delivered a short address, in which he alluded to the intimate connexion of the Royal Family with the University, traced briefly the history of the school of physiology, and acclaimed a scientific education as pre-eminently the one which compelled exactness of thought and made half-knowledge an impossible condition. Professor Langley, the professor of physiology, then gave an interesting account of the development of the physiological school at Cambridge, after which Lord Moulton of Bank thanked Prince Arthur for attending to declare the new school of the University open. The degree of LL.D. *honoris causâ* was then conferred upon Prince Arthur of Connaught, Lord Moulton of Bank (an old senior wrangler), Lord Esher, and Colonel Benson. The degree of D.Sc. *honoris causâ* was conferred upon Sir William Osler, Sir David Ferrier, Sir Edward Schäfer, and Professor E. H. Starling. Sir John Sandys, the Public Orator, in each case introducing the recipients with happy Latin phrases. After this the Vice-Chancellor of the University (Dr. Montagu James, Provost of King's College) and the Fellows of the College entertained a large company at luncheon.

Punctually at 3 30 the Vice-Chancellor of the University entered the precincts of the schools with Prince Arthur of Connaught, who immediately opened the door of the new building and admitted thereto a large crowd of ladies, distinguished guests, and members of the University, who were not sorry to take shelter from a cold rain storm. The whole building was thrown open as a going concern, and in every department interesting demonstrations could be seen in actual course at the hands of lecturers, demonstrators, and students. For example, on the ground floor the working and use of the compressed air plant, was shown, while in one room Miss Dale demonstrated the electric currents generated in the human heart; in another, Mr. R. A. Peters showed how to determine the relative acidity of any two samples of blood by electrical methods, if sufficiently sensitive; and in another Mr. A. V. Hill and Miss A. M. Hill showed the possibility of measuring by delicate electrical methods the amount of heat given out in a single twitch of a muscle.

On the first floor a demonstration was given of the Lucas pendulum used to discover the rate of conduction of nervous impulses, the recovery of muscle and nerve after stimulation, and other phenomena of excitable tissues. Kinematograph demonstrations were given on this floor during the afternoon. On the second floor Mr. H. Roberts gave a demonstration of the possibility of estimating the chlorides of the blood when only one drop of blood is used; Miss Tweedy gave a demonstration in the use of the ultra-microscope; and Dr. C. G. Douglas showed how blood gas analysis is carried out at high altitudes. The room in which these experiments were being done was stated to be about the size of the Alta Vista hut near the summit of the Peak of Teneriffe, and the conditions reproduced as nearly as possible those of investigations into the properties of the blood of persons living in a rarefied atmosphere at an altitude of 11,000 feet. In another room demonstrations were given by Dr. W. H. R. Rivers on mirror contrast, flicker, and colour blindness, and in another Mr. J. Barcroft explained the modern methods of blood gas analysis. On the third floor microscopic specimens of the tissues of the body were arranged with descriptions appended; and on the fourth floor demonstrations were given by students of the effect of heat, cold, and fatigue on muscle contraction, and of salts on the beating heart.

The large histology room on the third room was used by Professor Langley and Mrs. Langley as a reception- and tea-room, and as the afternoon went on became crowded with well-known members of the University, their many distinguished guests, and a large number of ladies.

The programme of the day closed with a dinner at Trinity College, to which many of the distinguished visitors were bidden.

The Rise of the Cambridge School of Physiology.

The occasion was felt by all present to be one upon which the University might well congratulate itself, while recording sincere thanks to the Worshipful Company of Drapers whose grant for the building and towards its equipment amounted to £23,000. The cost of the splendid and elaborate fittings was about £4000, and has been met partly out of the gift of the Drapers' Company and partly from benefactions received by the University for the completion of a scheme for housing the three departments of physiology, biochemistry, and experimental psychology. The chief of these benefactions emanated from Mr. Otto Beit, Lord Glenconner, Mr. Almeric Paget, and the Worshipful Company of Mercers; while large gifts have been made for the specific endowment of the new school of physiology by Trinity College, Gonville and Caius College, Messrs. Rothschild and Sons, Mr. Marlborough Prior, and Mr. J. F. P. Rawlinson, the Member of Parliament for the University. To the past scientific students of the University the approach to completion of the building plans must give peculiar pleasure, as many of them can remember the actual beginning of the famous Cambridge school of physiology. This dates only from 1870, when Trinity College imported Michael Foster from University College, London, elected him to a fellowship, and equipped two rooms for him as prælector in this subject. Under the inspiration of Foster and his pupils the students multiplied, the prælectorship became a professorship, and in due succession all the laboratories in Cambridge connected with biological study arose. In 1879 the University built additional rooms for the use of the department of physiology; in 1886 further premises were found for histological work; in 1889 a large extension of the physiological laboratory with a lecture theatre to hold 230 students was built; but by 1893, when Foster resigned, to be succeeded by his deputy, the present distinguished professor, Dr. J. N. Langley, the need for more laboratories was severely felt if the department was to maintain its great position and powers of progress. How insufficient the accommodation at last became was pithily described in a note on the school, supplied to the guests at the opening of the building provided by the Drapers' Company. "Already the Physiological Laboratory as then constituted" (the note refers to 1893) "was quite inadequate for the needs of the subject. The classes had outgrown the building, and the rooms for practical instruction were seriously overcrowded. The rooms available for research work were too few, and were not well adapted structurally to modern requirements, and these very soon became wholly insufficient for the Cambridge men engaged in research and for the foreign students who came in increasing numbers to do work in the Cambridge school. The rapid growth of biochemistry, within the subject of physiology, added to the congestion, and this was very imperfectly relieved by the addition in 1907 of a dark basement room for chemical work, and in 1909 of two disused coal-cellars in which important researches in nutrition and in electro-physiology were carried on." From this position the generosity of the Company of Drapers and of a group of other benefactors has now rescued the Cambridge workers in physiology, who see approaching completion, and completion in splendid form, a scheme for housing the three main departments of physiology in close organic connexion.

MEDICINE AND THE LAW.

Action upon a Restrictive Covenant.

IN the Palatine Court of Chancery at Manchester the Vice-Chancellor, Mr. Stewart-Smith, K.C., heard an action brought by Dr. J. Reid claiming an injunction to restrain Mrs. Mary Lowry from practising medicine within eight miles of Preston or Ashton-on-Ribble, according to the terms of an agreement between them made three or four years ago. Mrs. Lowry before her marriage had become an assistant to the plaintiff, under an agreement by which she bound herself not to practise either in her own name or otherwise within a specified area if she should cease to be so employed. The defendant left the plaintiff's service upon marrying another medical practitioner in the same district, Dr. A. E. Lowry, and it was alleged by Dr. Reid that she had since practised in contravention of her agreement. It was contended by the defendant that she had not so practised, but that in accordance with a verbal permission or arrangement with the plaintiff she had attended cases of emergency when her husband, owing to his engagements or for other reasons, was unable to do so. It was also part of her defence that the agreement relied upon by the plaintiff was wider than was necessary for his protection and therefore void. After evidence had been called and counsel had addressed the Vice-Chancellor the latter suggested the desirability of a settlement being arrived at, and after an adjournment for this purpose it was announced that it had been agreed that the period of the restrictive clause should be reduced to 12 years, that if the defendant's husband died within that period his widow should be able to free herself from the restrictions imposed upon payment of a sum of money to the plaintiff, and also that the restrictions had been so redrafted that Mrs. Lowry would be able to attend her husband's patients in specified circumstances without injuring the plaintiff's practice. Counsel for the plaintiff, in conclusion, stated that his client had not had any desire to limit the scope of Mrs. Lowry's assistance to her husband, and the Vice-Chancellor expressed approval of the settlement and of the course adopted by Dr. Reid in assenting to it.

Adenoids and Parental Responsibility.

At Atherstone recently a labourer was summoned for neglecting to obtain treatment for his daughter, 12 years of age, who was suffering from adenoids and enlarged tonsils. The defendant had been first warned in 1910, and the child had been found to have become worse in 1912, nothing having been done for her. In January, 1913, notice was again given to the defendant, who before the magistrates urged that he had no means wherewith to provide suitable treatment. The bench adjourned the case for a month in order that the father might apply to the guardians for assistance.

A Question of Medical Privilege.

In the Burton-on-Trent county court recently his honour Judge Macpherson, at the hearing of a claim for compensation by a miner, against a firm of colliery proprietors, condemned the furnishing of information with regard to their patients by members of the staffs of voluntary hospitals. In a leading article in THE LANCET of April 4th last, p. 978, comment was made upon the attitude adopted by his honour Judge Mellor upon a somewhat similar occasion in a case in which the medical man who was put in the witness-box by the employer had attended the workman as his private patient, and the decision of Judge Macpherson is, so to speak, complementary to that of his colleague on the bench. In the case heard at Burton-on-Trent the workman had been treated in the Burton infirmary, and the advocate representing the employers was cross-examining a medical witness called on behalf of the workman, basing his questions upon information which admittedly had been supplied by one of the honorary staff of the hospital who had performed an operation upon him. The judge thereupon interposed, saying that he did not think he could allow the questions, and upon being informed that the usual practice had been followed, and that in the case of a hospital payment could be made and an official report obtained, he said: "There should be no difference between a patient in an institution and a patient operated on privately." He afterwards said that he had "never yet heard any justification for a medical man betraying the affairs of a patient," and in giving his decision as to the compensation to be paid to the claimant, again expressed his surprise at employers being able to obtain from hospitals information with regard to the condition of workmen treated in them. He said further that until otherwise instructed by a higher court he would always do his utmost to prevent advocates making use of information obtained in the way indicated. He considered the practice of giving such information to be a plain breach of the confidence expected to exist between a medical man and his patients. Medical practitioners upon the staffs of hospitals have no desire as a rule to figure as witnesses in county courts or elsewhere, or to be asked to furnish information or otherwise to assist in the carrying on of litigation. They will no doubt read with satisfaction the observations of Judge Macpherson, and hope that his attitude towards their evidence will be generally adopted, and that they will be instructed by judicial authority to withhold all information. On the other hand it may be pointed out that the hospital surgeon's evidence is likely to be the best obtainable in the interests of justice and for the purpose of getting at the truth, and that the employer who receives a report in the workman's favour may proceed to pay him compensation without bringing the matter before a judge. On such an occasion the medical man is treated as he should be, as an impartial deponent to facts and a partisan of neither side. Of course, the workman will not call him as a witness if his evidence is likely to be against the claim which is being made for compensation, and will be glad that the information he can give should not be at the disposal of the employer.

ANTE-NATAL HYGIENE AND THE NOTIFICATION OF PREGNANCY.—The council of the county borough of St. Helens have confirmed a resolution of the health committee that midwives should be instructed to notify to the medical officer of health forthwith on being engaged to attend a woman in her confinement, in order that advice may be given to expectant mothers, and suitable arrangements made in certain cases for their assistance.

REPORT OF THE SANITARY COMMISSIONER WITH THE GOVERNMENT OF INDIA FOR 1912.

Of the eight sections into which the Indian Sanitary Report for 1912 is divided the first two, concerning the European and Indian troops, are contributed by the Director of Medical Services in India, the officer formerly known as Principal Medical Officer to H.M. Forces. Section VI., relating to the medical institutions of the country, is by the Director-General, Indian Medical Service. For the remaining five sections Major J. C. Robertson, the Sanitary Commissioner, is directly responsible.

Health of the European Troops in India.

The average strength of European troops during 1912 was 71,001 warrant and non-commissioned officers and men. Their admissions to hospital numbered 547·9 per 1000; the constantly sick in hospital were 28·86, the deaths 4·62, and the invalids sent home 6·68 in ratios per 1000. These ratios were considerably lower than the corresponding figures for the preceding quinquennium (1907–11). The admission rate was rather higher than that for 1911 (524·7), and the constantly sick-rate practically the same (28·81 in 1911); the other two ratios were slightly lower than in the year preceding. The total deaths, amounting to 328, were less than in any former year, the ratio per 1000 (4·62) being also the lowest ever recorded. The most fatal diseases were enteric fever (26 deaths, or 0·37 per 1000), suppurative hepatitis (23), pneumonia (20), appendicitis (19), heatstroke (14), and pulmonary tuberculosis (11). There were also 20 deaths from gunshot wounds and 20 cases of drowning.

On comparing the health statistics of the troops in different parts of India, and taking the average number of men constantly sick in hospital as a guide, it is seen that the Burma Coast and Bay Islands group (Rangoon and Port Blair) is the most unhealthy, with a ratio of 39·3 per 1000, while in the Deccan the average ratio was only 28·4, and in the Southern India group 28·1. The admission ratio was highest in the North-West Frontier, Indus Valley and Rajputana group of stations (793·3 per 1000), and lowest in Bengal and Orissa (463·6). The individual stations of importance that have suffered most sickness have been Peshawar, with an admission ratio of 1163, and 44·1 per 1000 constantly sick; and Nowshera, with corresponding ratios of 934 and 29·4; Lahore, Rawal Pindi, Delhi, and Jhansi had over 800 admissions per 1000 strength. On the other hand, Belgaum had an admission rate of only 264·2, the constantly sick being 17·8; at Kirkee these ratios were 401 and 29·7; at Multan, 420 and 19·9; at Secunderabad, 488 and 28·6.

Principal Diseases.

The chief cause of sickness in India is fever of one kind or another, formerly returned as malaria, but now separated under various headings, in accordance with more exact methods of diagnosis. Of the total proportion of 547 admissions to hospital per 1000 strength those attributable to malaria, sandfly fever, and pyrexia of uncertain origin amounted to 134·1; the cases definitely diagnosed as malaria (82·4 per 1000) were less numerous than in the years immediately preceding, but the sandfly fever prevalence has risen to 30·5 admissions per 1000. The prevention of this fever, as of malaria, is largely a matter of protection by mosquito netting. We are informed that there is a slow but steady increase in their use in barracks; many are provided regimentally and a few by the men themselves out of their own pockets. It is most regrettable, however, to learn that "the Government of India have definitely decided to incur no expense in providing nets for soldiers other than in a few selected places." Among the large stations Lahore, with 302 admissions per 1000 for malaria, suffered most; Jubbulpore (285), Peshawar (276), and Delhi (221) also suffered severely. To these figures should be added the admissions for sandfly fever, which were 6·7 only at Lahore and 23 only at Jubbulpore; at Peshawar they were 265 and at Delhi 109 per 1000. At Nowshera the malaria admissions were not more than 102 per 1000, but those diagnosed as sandfly fever reached the very high ratio of 328, making this station the most fever-stricken of any, next to Peshawar. In a note on the sanitary condition of Peshawar it is stated that the surface drainage is unsatisfactory, but that the antimalarial measures adopted have been beneficial. The further curtailment of irrigation would appear to be necessary, even if the picturesqueness of the station be diminished.

The decrease in enteric fever continues most satisfactorily; the number of cases during 1912 (118, or 1·7 per 1000) was the lowest on record. Paratyphoid fever caused 64 admissions and 2 deaths. The two diseases combined, therefore, gave an admission ratio of only 2·6 per 1000, a figure which is to be compared with 8·5 per 1000 in 1907–11, and with 20·5, the ratio for enteric fever admissions in the decennium 1897–1906. Similarly the enteric and paratyphoid combined death-rate in 1912 was 0·39 per 1000; in the period 1907–11 it was 1·59; and in 1897–1906 it was 5 per 1000, more than 12 times that of the year now under consideration. The largest number of cases at any station was 27, at Fyzabad (30·6 per 1000), most of these occurring in March and May; no account is given of this outbreak. Secunderabad had 16 cases, 7 occurring in October. It is satisfactory to learn that 90 per cent. of the European troops serving in India have been inoculated against enteric fever; the amount of protection afforded may be gauged by the relative figures of incidence and mortality. Amongst inoculated men the admission and death ratios were 1·20 and 0·15 per 1000; amongst the non-inoculated they were 6·03 and 2·67; further, the case mortality in the inoculated was only 12·8, in the uninoculated it was 40, per 1000. So far inoculation against paratyphoid fever does not appear to be effective; of the 64 cases that occurred, all but one had been inoculated. The enteric fever depôts at Naini Tal and Wellington, for the Northern and Southern armies respectively, have continued to be most serviceable. The importance of sending to these depôts cases of pyrexia of uncertain origin, as well as enteric and paratyphoid, is fully recognised; two paratyphoid carriers were detected in this way. No carrier of B. typhosus was discovered during the year. Important work was carried out on the viability of the paratyphoid A bacillus in the fæces of carriers, buried in earth according to the ordinary trenching system as adopted in the plains. While remaining infective for a long period in the cold weather, owing to multiplication of saprophytes they lost infectivity within ten days in the warmer season. The same bacillus did not remain viable in flies fed on infected fæces longer than 24 hours.

A considerable increase is recorded in the prevalence of dengue, for which there were 364 admissions, mostly in Calcutta and Madras. The manner of infection is unknown, and microscopic research has so far not been successful, though there is reason to suspect conveyance by some kind of sandfly. It is most satisfactory to learn that not a single case of rabies occurred among the European troops, though 81 men and 14 officers underwent antirabic treatment for bites by suspected animals. There were no admissions for beri-beri, but 60 cases of multiple neuritis occurred, chiefly in Calcutta and other stations in Bengal; there were two deaths from heart failure. As to its causation, the writer of the report recommends suspension of judgment, but suggests that it may be due to the absence of some essential principle, or "activator," from certain foods. The cases occur consistently in certain areas where climatic conditions favour a rapid deterioration in the foodstuffs. A marked improvement is noticeable in two allied infections, dysentery and liver abscess. For the former the admissions were only 5·2 per 1000; in 1908 they had been 14·4, and in the period 1907–11 they had averaged 10·5 per 1000. For liver abscess the admissions were 0·7 per 1000; in 1908 they had been 1·7 per 1000. This reduction is probably largely due to the great increase in temperance in alcohol consumption that has been so marked a feature in recent years. A corresponding diminution in venereal disease is no doubt associated with the same factor. The admission-rate in 1912 was 55·5 per 1000; in 1907–11 it was 67·8; in 1897–1906 it had been 273 per 1000. There was a slight increase, it must be admitted, over the ratio for 1911. The usual great variation in prevalence is recorded. In Burma (excluding Rangoon) there were 107 admissions per 1000; in Meerut, Ambala, Rawal Pindi, &c., there were only 49·6 per 1000. The salvarsan treatment with subsequent use of mercury and iodides, has been carried out satisfactorily.

The number of men invalided home was the lowest on record, amounting to only 474 for all causes; in 1904 the corresponding number had been 2506. This improvement (and saving of expense) has been largely due to the policy at present adopted of sending as many men as possible to the hills during the hot season.

Health of the Indian Army.

The average strength of the troops composing the Indian army in 1912 was 132,232. From this force the admissions to hospital were at the rate of 547·5 per 1000, a slight increase over the rate for 1911 (515·8), but below the average for the quinquennium 1906–1910, which was 623·2. The number constantly sick was 20·1, and the invaliding ratio was 4·61 per 1000, both of these ratios being slightly in excess of those for the preceding year (19·8 and 4·43 respectively), but below the quinquennial averages of 21·9 and 6·07. The death-rate, 4·42, is the lowest hitherto recorded; for the quinquennium 1906–1910 it had been 6·14, and down to 1903 it had never been less than 10 per 1000. The chief causes of sickness during the year were the same as usual—namely, malaria (88·9 admissions per 1000), to which may be added pyrexia of uncertain origin (44·1) and sandfly fever (10); next, respiratory diseases (25·2), dysentery (16·7), and venereal diseases (14·4). The diseases that caused most deaths were pneumonia (0·83 per 1000), enteric fever (0·47), cholera (0·29), malaria (0·25), and tubercle of the lungs (0·24). The Northern army showed a higher admission-rate (633·8) than the Southern army (505·8), according to the experience of previous years; but the death-rate in the former (4·43 per 1000) was below that in the latter (4·81). The province of Bengal and Orissa showed the highest admission ratio of 817·3 per 1000, while in the adjoining area, known as the Gangetic Plain and Chota Nagpur, the corresponding ratio was the lowest, being only 446·4. This enormous difference was due to the high prevalence of malaria and uncertain pyrexia in the former area (chiefly in Calcutta), and their relative rarity in Lucknow and Fyzabad. Malaria was especially prevalent in Delhi (357 admissions per 1000), Dera Ismail Khan (403), and Fort Dufferin (353). There was on the whole considerably less fever during 1912 than in recent years, partly due to natural causes, but partly also, no doubt, to the measures that have been vigorously taken in cantonments all over the country to keep down mosquitoes. The causes for these special outbreaks seem to have been fairly satisfactorily determined. At Port Blair, for instance, a musketry camp was pitched within 50 feet of an anopheles-infected nullah. At Delhi fever occurred chiefly among the native infantry, whose lines at Daryaganj are near the swampy ground adjoining the Jumna, and have a malaria-stricken population in the bazar immediately alongside. A great increase is recorded in the occurrence of sandfly fever, for which there were 1316 admissions, compared with 114 in 1911. The stations most affected were Meerut (517) and Jullundur (271). Probably the large number of cases returned "was due mainly to greater attention being paid to slight cases of fever, which in former years would either have escaped notice and would not have been admitted to hospital or would have been included under other heads." There was less enteric fever (243 admissions and 62 deaths). The Gurkhas at Almora had 13 cases; at three other stations the native troops suffered more than has hitherto been usual; in each case (Aurangabad, Secunderabad, and Kohat) a polluted water-supply was considered to be the cause. Dengue showed a great increase—333 cases compared with only 2 in 1911. The 40th Pathans at Calcutta had 273 admissions, but the actual mode of infection was not demonstrated. Plague caused only 23 admissions and 13 deaths. A considerable amount of inoculation has been carried out, especially when the disease broke out in a station. Pulmonary tubercle remains at a low prevalence, 2·0 admissions per 1000, or 262 in all. [illegible] The Gurkhas suffered most (5·1 per 1000 with [illegible] deaths), the rest of the Indian army furnishing only 1·7 admissions and [illegible] deaths. Pneumonia continues to be the most fatal disease among native troops, the death-rate being 0·83 per 1000, a considerable improvement, however, on the decennial ratio for 1901–10, which was 2·26 per 1000.

Health of the General Population.

The birth-rate for British India rose from 36·56 per 1000 in 1911 to 38·95 in 1912, the mean ratio for the preceding quinquennium having been 38·04. Since the issue of the previous report the boundaries and designations of some of the Bengal provinces have been altered, so that a comparison with statistics of the years immediately preceding cannot be made. "Eastern Bengal and Assam" has been abolished and the new administrative areas are termed Bengal, Assam, and Bihar and Orissa. The highest birth ratio was 48·24 per 1000 in the Central Provinces; in Madras it was only 30·90. The death-rate for British India was 29·71, an improvement on the ratio for the previous year (32·01) and for the preceding quinquennium (34·28). The ratio was highest in the Central Provinces and Berar (42·34). In the North-West Frontier Province it was only 23·29 and in Madras Presidency 24·3 per 1000. Of the total death-rate (29·71 per 1000), fever accounted for 16·49. In Bengal the fever death-rate was 21·16 and in the United Provinces 20·66. On the other hand, in Madras it was only 7·6 and in Lower Burma 8·35. There were 253,067 deaths from plague, giving a ratio of 1·10 per 1000, compared with 3·07 in 1911. The prevalence was chiefly in the United Provinces (2·45 deaths per 1000), Bihar, and the Punjab. Cholera caused 407,769 deaths (1·71 per 1000), Bombay, Central Provinces, Assam, Bihar, and Bengal being chiefly affected, in the order named. Small-pox caused 89,357 deaths (0·37 per 1000), an increase over the mortality in 1911, which was 0·25 per 1000; it prevailed chiefly in the Punjab (1·57 deaths per 1000).

The health statistics of Delhi are of interest in view of the fact that it is now the official capital of the country. Its general death-rate (43·74 per 1000 for the city, 39·26 for the district, including the city) is to be compared with the general death-rate for British India (29·71) and the general death-rate for towns and municipalities (33·07). These are the figures for 1912. For the preceding quinquennium the death-rate for the city was 55·34, and 55·29 for the district, including the city; the general death-rate for British India was 34·28, and the general death-rate for towns and municipalities 36·48. No doubt extensive sanitary works will be undertaken to reduce this comparative unhealthiness of the existing city of Delhi, which would otherwise be a menace to the health of the New Delhi that is to come into being alongside of it. A special health department has already been created for the old city and the temporary capital on its north side, and the new works in course of construction to the south are in charge of special health officers.

Indian Jails.

The total prison population of India and Burma, including the Andamans, during 1912 was 103,906, the death-rate being 18·36 per 1000, compared with 21·76 in the decennium 1902–11. If the Andaman islands settlement be excluded the death-rate was only 16·74; this is the lowest ever recorded. In the Assam jails the ratio was as high as 38·92; in those of the Gangetic Plain the mortality was only 12·26; and in Southern India only 12·03. The chief causes of death were pulmonary tubercle (3·8 per 1000), dysentery (2·59), and pneumonia (1·72). The chief causes of sickness were malaria (105 admissions per 1000), ulcer, abscess and boil (61), and dysentery (55). Malaria showed an improvement over former years, except in Bengal, the Punjab, and the North-West Frontier Province. Pulmonary tuberculosis is still rather more prevalent than during the decennium 1902–11. In the Punjab jails the tuberculous admissions were 17·5 and the deaths 5·16 per 1000; in Bihar and Orissa these ratios were 13·6 and 3·96 respectively. Major W. C. H. Forster, I.M.S., has reported on the prevalence of tuberculosis in the jails of the Punjab, and attributes it partly to overcrowding and general insanitary conditions, and partly to infection. The local government has sanctioned the construction of a special jail for tuberculous patients. Small outbreaks of cholera occurred in the Vizagapatam and Ahmedabad jails, attributed to flies in each case.

The present report, prepared by Major J. C. Robertson, I.M.S., Sanitary Commissioner with the Government of India, is a model of condensation, and is extremely well printed; an excellent map is prefixed, which increases its interest.

MAY AT HOME AND ABROAD.

At Home.

THE rains of early May, after the long drought of April, were very welcome, and although they were not generally heavy did much for the agriculturist. After the 8th or 9th the weather was nearly continuously dry until towards the end of the month, and the subsequent rains, accompanied locally by sharp thunderstorms, swelled the total to nearly the May normal. As is usual, the month brought both hot and cold spells, according to the direction of the main wind current and the state of the sky. The first week was moderately warm, the second cold, and the rest of the period mostly summer-like until the sudden drop of temperature following the thunderstorms of the 24th and 25th. Both the days and nights for a time during the last week were very cold for the time of the year, and frost, which had until then been either entirely absent or too slight and local to do much damage to vegetation, became severe and widespread, and it is to be feared that great injury was wrought to fruit trees and early potatoes in certain Midland and Northern districts. In the London area, however, there was no frost sharp enough to do much damage, and at Kew the lowest point reached by the sheltered thermometer was 36° on the 26th. It is rare that all the elements agree so well with the average as was the case at Kew during May. The mean maximum temperature, 62°, was just 1° above the normal, while the mean minimum, 45°, was equal to it, and the total rainfall, 1·75 in., was also the same as the normal. The sunshine differed very little, the 194 hours recorded being only seven hours below the average. The highest shade temperature was 80° on the 22nd—a reading 31° above that of the coldest day on the 9th. Bath was as warm as Kew during the daytime and only a degree colder at night, and its total rainfall was rather less. Its sunshine, however, was lower, although only by 14 hours. The Midlands, as represented by Nottingham, had a mean maximum temperature of 60° and a mean maximum of 42°, a total rainfall of about 1·7 in., and a large amount of sunshine. At Nottingham the record was 15 hours higher than at Kew. The extreme south-west of England enjoyed a dry and very sunny month. At Torquay the total hours of sunshine amounted to 225, at the Scilly Islands to 222, and at Newquay to 202 hours, while in the Channel Islands the record was more than 230 hours. The mean minimum temperature at Torquay, Scilly, and Newquay was 48°, but Torquay was the warmest spot of the three during the daytime, having a mean maximum temperature of 61°, against 58° at Scilly and 57° at Newquay. Jersey was very slightly warmer both during the day and night.

Abroad.

Paris had many very warm days, the highest shade temperature being 84° on the 22nd, and the mean maximum for the month 63°, or a degree higher than at Kew. The mean minimum, however, was a trifle lower than the corresponding figure at Kew. The change from heat to relative cold was almost as great after the 25th as in this country. Few days were sunless, and on several there was scarcely a cloud, but the total amount of sunshine was only three more than at Kew and less than in many parts of this country. Paris had more frequent rain than London, and also a larger aggregate. At Berlin also the weather was more rainy than in London, and the total amounted to as much as 3·7 in. Changes of considerable magnitude in temperature were rather frequent, but the mean for the month was almost identical to that at Paris. The mean minimum was the same, and the mean maximum 1° higher. No frost occurred in either city. Vienna, although farther to the south, was appreciably colder than Berlin during the day, its mean maximum temperature being no higher than 59°, and the highest reading for the month 75°. At night, however, it was relatively mild, its mean minimum temperature being the same as that at Paris and Berlin. Rain fell on 14 days and yielded a total of 3·6 in. In the south-west of France there was a marked outburst of heat on the 22nd, the same day as the maximum in this country. At Biarritz the thermometer rose to 90°, but on the day following it got no higher than 66°. The mean maximum at that resort was 66° and the mean minimum no lower than 52°. Rain was never long absent, and the total for the month exceeded 3 in. Still further south, at Rome, the days were as hot as those of a warm July in England. Readings above 80° were common, and the mean maximum was as high as 72°. Very few of the nights were at all cold, and the mean minimum temperature was no lower than 55°. Italy generally had a fairly normal month, although rain, never very unwelcome in June, was perhaps more frequent than usual. The hottest days were experienced early in the month and after the middle, the end being comparatively cool.

ROYAL COMMISSION ON VENEREAL DISEASES.

AT the fortieth meeting of the Royal Commission on Venereal Diseases evidence was given by Dr. Dubois Havenith, of Brussels, who was secretary to the International Congresses of 1899 and 1902 dealing with venereal diseases.

Dr. Dubois Havenith reviewed the principal preventive measures for dealing with ordinary infectious diseases—viz., notification, isolation, disinfection, and general sanitary measures aiming at combating all unhealthy conditions; of these he said in the case of syphilis disinfection, by which he meant the getting rid of contagious lesions and the sterilising of contaminated objects, was essential. In effect, disinfection in the case of syphilis consisted in treatment. Dr. Havenith laid stress on the need for early diagnosis, free and readily accessible treatment, and supervision of the treatment for such time as might be necessary. For the purpose of early diagnosis it was necessary to make adequate provision of laboratories in which bacteriological and other tests could be carried out. The discovery of the existence of the disease should be followed immediately by treatment, and it was necessary to arrange for clinics which would be open after the ordinary hours of labour. In order that patients, who were often negligent or ill-instructed, should not abandon their treatment it was desirable to introduce some measure of control or surveillance. Such a system was already in operation at the dispensary founded by Professor Malvoz at Liége,[1] where arrangements had been made, with the consent of the patients, for keeping in touch with them, for the purpose of giving advice, for submitting them to the investigations necessary to determine the permanence of the cure, for warning them against contracting marriage too early, and so on. It had been found in practice that the scheme worked well and that patients were willing to fall in with the arrangements. Dr. Havenith thought that it was very important that the public should be enlightened upon the gravity of syphilis both from the individual and the public point of view, but it was equally important that it should be realised that syphilis was a curable disease, that as a rule it was avoidable, and that if properly treated it ceased to be contagious.

---

[1] THE LANCET, May 9th, 1914, p. 1343.

THE Tenth International Congress of Otology will be held in Hamburg from Sept. 5th to 8th, 1915. The International Rhino-Laryngological Congress, to which reference was made in an annotation in THE LANCET of May 30th (p. 1554), will be held in the same place immediately afterwards—viz., from Sept. 9th to 12th.

UNIVERSITY OF LONDON.—An advanced lecture entitled Some Problems in Cardiac Physiology (being contributions to a study of the relations which exist between the various chambers of the Mammalian heart) will be given in the Physiological Laboratory of the University, South Kensington, S.W., by Mr. A. F. Stanley Kent, M.A. (Henry Overton Wills Professor of Physiology in the University of Bristol), at 5 P.M., on Thursday, June 18th. Admission free, without ticket. The last two lectures of the course of advanced lectures by Professor Brodie, F.R.S., on The Gaseous Exchanges of the Body, in the Physiological Laboratory of King's College, Strand, W.C., will be given on Monday, June 15th, and Thursday, June 18th, at 4.30 P.M., instead of on the dates previously announced.

Public Health.

ANNUAL REPORTS OF MEDICAL OFFICERS OF HEALTH.

County Borough of St. Helens.—The report relating to the health in 1913 of this well-known industrial borough in Lancashire (with a population now close upon 100,000) is made by Dr. H. J. Cates, who succeeded Dr. J. J. Buchan as medical officer of health in July of that year. It contains many matters of interest. Under the heading of "food poisoning" is described the illness of 20 persons in eight families, traced to eating corned beef obtained from a 6 lb. tin which was sold in portions by retail at a small shop in Parr. The tin was not opened until the meat was required by the first of the purchasers, and all those affected seem to have obtained and consumed the meat on the same day. It was normal in appearance and bacteriological examination gave no evidence of the presence of any organisms likely to give rise to the illnesses which occurred. On the other hand, specimens of blood from those affected reacted with certain of the organisms of the coli group, and the illness commenced at comparatively short intervals after the meat had been consumed, usually two hours; in the shortest case three-quarters of an hour, and in the longest five hours. It appeared probable, therefore, that the meat contained bacterial toxins, undestroyed by the process of cooking at the factory where it was canned. St. Helens has a public abattoir, with associated cold stores, at which thorough inspection of meat takes place, with satisfactory results. As usual, however, in English towns, the value of the abattoir is diminished by the continued existence of private slaughter-houses and by the use of places outside the borough for the preparation of meat which has not been inspected. The death-rate of St. Helens from pulmonary tuberculosis was 1·0 per 1000 during the year, and the total deaths recorded 103. In the same period 253 primary notifications were received, and it is noteworthy that 30 of the deaths occurred in persons concerning whom no notification was made, while in other 35 deaths the notification only preceded the death by a few weeks. Similar evidence of the large proportion of tuberculosis cases which must escape notification is afforded by the figures for non-pulmonary disease, of which 164 notifications were received during a period in which 90 deaths occurred. It is to be expected that the further development of the tuberculosis dispensary work, which is now carried out on new and well-equipped premises, will lead to earlier discovery and treatment of all forms of tuberculosis. Dr. S. J. C. Holden contributes an appendix to the report on the "after-care of the consumptive," in which the remedies for the disabilities of the tuberculous case after leaving the sanatorium are discussed. Dr. Holden suggests that the difficulty which these patients often have in maintaining their improved health when they return to defective or overcrowded dwellings might be met by provision of special cottages with open air rooms as part of municipal housing schemes, or by contribution by the local authority which will enable them to move to superior houses at higher rents, or again by municipal lodging-houses specially adapted for tuberculous cases, possibly built as an adjunct to the sanatorium. Such proposals certainly seem to follow logically on the general provision of sanatorium treatment, although some limit must be placed on the consideration given to the tuberculous at the expense of the healthy. It may perhaps be added that the special housing arrangements suggested for persons returning to work after sanatorium treatment are hardly likely to diminish that "unfounded fear" of employers of engaging tuberculous persons which Dr. Holden energetically attacks, and we are not sure that his further suggestion that the local authority should recruit its tram-drivers and tram-conductors from the sanatorium would receive public support. St. Helens had in 1913 a high birth-rate, 32·15. The rate of infant mortality, 155 per 1000 births, was, however, also considerable. The death-rate of infants from "premature birth" was higher than the corresponding rate in any of the county boroughs in England and Wales, and these deaths formed 22 per cent. of the total deaths under one year of age. Dr. Cates ascribes a large share of the infant mortality to what are collectively known as ante-natal causes, closely related to the physique and home circumstances of the mothers. Of the total births occurring in the borough during the year 93·8 per cent. were attended by midwives, a higher proportion than we remember to have seen recorded elsewhere. Stillbirths notified by midwives amounted to 4·6 per cent. of the births attended, the proportion varying considerably in the practice of different midwives. Dr. Cates reports that maternity benefit has already proved of great assistance in providing the necessary medical aid, clothing, and food.

Borough of Stafford.—Dr. F. M. Blumer reports considerable activity in applying the Housing Acts in this borough, but the making of closing orders in respect of insanitary property is delayed by the absence of suitable working-class house accommodation elsewhere. During the year the Local Government Board approved plans for the erection of 60 working-class dwellings, some being let at rentals of 3*s*. 9*d*. and 4*s*. 3*d*. a week, according as they have two or three bedrooms. Another batch of 40 cottages has been decided upon, and Dr. Blumer considers that this action by the town council has created a strong public opinion "which is acting as a driving power to insist on the provision of a sanitary house and surroundings for every family." At the same time, the report realises that however satisfactory the houses may be, there is a large class of tenants which would never attempt to keep them clean, and urges that children must now be educated scrupulously to appreciate cleanliness if slum conditions are to be abolished in the next generation.

Borough of Kingston-upon-Thames.—Special care is given to sewage treatment in this borough, which is sewered on the separate system. At the disposal works, which are in the centre of the town and adjoin the public gardens, the sewage is deodorised before pumping by mixture with charcoal and clay. It is then precipitated with sulphate of alumina, manufactured at the works, in eight large settling tanks, the effluent from which is treated in percolating filters before discharge into the Thames. The sludge is pressed and barged away to a fertiliser factory. The filtered effluent contains, it is stated, only about 1 part of albuminoid ammonia per 1,000,000, and is clear, sparkling, and free from odour. In commenting on provision for infectious diseases, Mr. H. B. Collins states that isolation of ordinary cases of scarlet fever and diphtheria has not been found necessary. Most of the fatal cases of diphtheria are moribund when notified—a somewhat unusual experience, and one which it might be thought would no longer be met with if the reception of diphtheria cases into hospital was regarded as a normal and not as an exceptional proceeding. Out of 893 births during the year as many as 150 were not notified under the terms of the Notification of Births Act. It is suggested that this is the result of dislike to the Act on the part of some of the medical men in the town, but Mr. Collins points out that the Act has been in operation for five years, and that to withhold notification merely as a protest is now only to give trouble to officials who have to carry out the Act but were not responsible for its terms.

VITAL STATISTICS.

HEALTH OF ENGLISH TOWNS.

IN the 97 English and Welsh towns with populations exceeding 50,000 persons at the last Census and whose aggregate population at the middle of this year is estimated at 18,120,059 persons, 9504 births and 4555 deaths were registered during the week ended Saturday, May 30th. The annual rate of mortality in these towns, which had steadily declined from 15·1 to 13·9 per 1000 in the five preceding weeks, further fell to 13·5 per 1000 in the week under notice. During the first eight weeks of the current quarter the mean annual death-rate in these towns averaged 14·3, against 13·4 per 1000 in London during the same period. Among the several towns the death-rate during the week under review ranged from 5·1 in Edmonton, 5·2 in Bath, 6·5 in Acton and in Willesden, 6·8 in Enfield, and 7·5 in Gillingham, to 18·9 in Salford, 19·9 in Wigan, 20·1 in Sunderland, 21·0 in Middlesbrough, and 21·7 in Oldham.

The 4555 deaths from all causes were 198 fewer than the number in the previous week, and included 391 which were referred to the principal epidemic diseases, against 421 and 455 in the two preceding weeks. Of these 391 deaths, 139 resulted from measles, 111 from whooping-cough, 52 from infantile diarrhoeal diseases, 47 from diphtheria, 31 from scarlet fever, and 11 from enteric fever, but not one from small-pox. The mean annual death-rate from these diseases was equal to 1·1, against 1·2 and 1·3 per 1000 in the two preceding weeks. The deaths attributed to measles, which had been 146, 138, and 143 in the three preceding weeks, fell to 139, and caused the highest annual death-rates of 1·0 in Liverpool and in Leeds, 1·1 in Manchester and in Sheffield, 1·7 in Wigan and in Rochdale, and 2·8 in Warrington and in Burnley. The deaths referred to whooping-cough, which had been 146, 143, and 144 in the three preceding weeks, declined to 111; of this number, 16 occurred in London, 12 in Manchester, 9 in Liverpool, 7 in Leeds, 7 in Sheffield, and 5 in South Shields. The fatal cases of diarrhœa and enteritis (among infants under 2 years), which had been 59, 69 and 83 in the three preceding weeks, fell to 52, and included 16 in London and 3 each in West Ham, Liverpool, and Middlesbrough. The deaths attributed to diphtheria, which had been 44, 31, and 51 in the three preceding weeks, fell to 47, of which 10 were registered in London, 4 in Manchester, and 3 each in Stoke-on-Trent, Birmingham, Liverpool, and Hull. The deaths referred to scarlet fever, which had been 27, 33, and 34 in the three preceding weeks, fell to 31; 6 deaths were recorded in London, 5 in Manchester, 3 in Sheffield, 3 in Middlesbrough, and 2 each in Birmingham, Liverpool, and Salford. The fatal cases of enteric fever, which had been 13, 7, and 13 in the three preceding weeks, were 11 in the week under notice, and included 4 in London and 2 in Oldham.

The number of scarlet fever patients under treatment in the Metropolitan Asylums and the London Fever Hospitals, which had been 2901, 2862, and 2909, at the end of the three preceding weeks, was 2910 on Saturday, May 30th; 377 new cases were admitted during the week, against 398, 349, and 415 in the three preceding weeks. The hospitals also contained on the 30th ult. 1086 cases of diphtheria, 367 of whooping-cough, 93 of measles, and 40 of enteric fever, but not one of small-pox. The 1026 deaths from all causes in London were 71 fewer than in the previous week, and corresponded to an annual death-rate of 11·8 per 1000. The deaths referred to diseases of the respiratory system, which had been 221, 190, and 188 in the three preceding weeks, further fell to 165 in the week under review, and were 21 fewer than the number in the corresponding week of last year.

Of the 4636 deaths from all causes in the 97 towns, 173 resulted from different forms of violence, and 381 were the subject of coroners' inquests, while 1387 occurred in public institutions. The causes of 33, or 0·7 per cent., of the total deaths were not certified either by a registered medical practitioner or by a coroner after inquest. All the causes of death were duly certified in Sheffield, Leeds, Bristol, West Ham, Bradford, Hull, Newcastle-on-Tyne, and in 72 other smaller towns. Of the 33 uncertified causes of death, 8 were registered in Birmingham, 5 in Liverpool, and 2 each in St. Helens, Rochdale, Barrow-in-Furness, and Darlington.

In the 97 English and Welsh towns 7430 births and 4586 deaths were registered during the week ended Saturday, June 6th. The annual rate of mortality in these towns, which had declined from 15·1 to 13·3 per 1000 in the six preceding weeks, further fell to 13·2 per 1000 in the week under notice. During the first nine weeks of the current quarter, the mean annual death-rate in these towns averaged 14·2, against 13·3 per 1000 in London during the same period. Among the several towns the death-rate last week ranged from 3·7 in Eastbourne, 5·2 in Ilford, 5·9 in Hornsey, 6·8 in Enfield, and 7·1 in East Ham, to 18·8 in Liverpool, 19·2 in Stoke-on-Trent, 19·7 in Carlisle, 19·9 in Lincoln, and 21·1 in Oldham.

The 4586 deaths from all causes were 50 fewer than the number in the previous week, and included 401 which were referred to the principal epidemic diseases, against 468 and 391 in the two preceding weeks. Of these 401 deaths, 131 resulted from measles, 117 from whooping-cough, 80 from infantile diarrhœal diseases, 38 from diphtheria, 26 from scarlet fever, and 9 from enteric fever, but not one from small-pox. The mean annual death-rate from these diseases last week was equal to 1·2, against 1·3 and 1·1 per 1000 in the two preceding weeks. The deaths attributed to measles, which had been 138, 143, and 139 in the three preceding weeks, further declined to 131 last week, and caused the highest annual death-rates of 1·2 in Middlesbrough, 1·9 in Burnley and in Barnsley, 2·1 in Bootle, and 3·3 in Rochdale. The deaths referred to whooping-cough, which had been 143, 144, and 111 in the three preceding weeks, rose to 117 last week; the highest recorded death-rates from this cause were 1·3 in Gateshead, 1·4 in Oldham and in South Shields, 1·7 in Exeter, and 1·9 in Barnsley. The fatal cases of diarrhœa and enteritis (among infants under 2 years), which had been 69, 83, and 52 in the three preceding weeks, rose to 80 last week, of which 26 were recorded in London, 7 in Birmingham, 6 in Liverpool, 5 in Cardiff, 4 in Manchester, 3 in Leeds, and 3 in Hull. The deaths attributed to diphtheria, which had been 31, 51, and 47 in the three preceding weeks, further fell to 38 last week, and included 11 in London, 3 in Manchester, and 2 each in Bournemouth, Birkenhead, Liverpool, and Leeds. The deaths referred to scarlet fever, which had been 33, 34, and 31 in the three preceding weeks, further fell to 25 last week; 4 deaths occurred in Liverpool, 3 in London, 3 in Oldham, 2 in Nottingham, and 2 in Manchester. The fatal cases of enteric fever, which had been 7, 13, and 11 in the three preceding weeks, further declined to 9 last week, but showed no excess in any of the large towns.

The number of scarlet fever patients under treatment in the Metropolitan Asylums and the London Fever Hospitals, which had been 2862, 2909, and 2910 at the end of the three preceding weeks had further increased to 2970 on Saturday last; 339 new cases were admitted during the week, against 349, 415, and 377 in the three preceding weeks. These hospitals also contained on Saturday last 1105 cases of diphtheria, 360 of whooping-cough, 100 of measles, and 32 of enteric fever, but not one of small-pox. The 1098 deaths from all causes in London were 73 in excess of the number in the previous week, and corresponded to an annual death-rate of 12·7 per 1000. The deaths referred to diseases of the respiratory system, which had declined from 221 to 165 in the four preceding weeks, rose to 179 in the week under notice, and were 17 in excess of the number in the corresponding week of last year.

Of the 4586 deaths from all causes in the 97 towns, 194 resulted from different forms of violence, and 388 were the subject of coroners' inquests, while 1331 occurred in public institutions. The causes of 32, or 0·7 per cent., of the total deaths were not certified either by a registered medical practitioner or by a coroner after inquest. All the causes of death were duly certified in London and in its 14 suburban districts, in Sheffield, Leeds, Bristol, Bradford, Hull, Newcastle-on-Tyne, and in 57 other smaller towns. Of the 32 uncertified causes of death last week, 8 were registered in Liverpool, 3 in Birmingham, 3 in Blackburn, 2 in Reading, and 2 in Sunderland.

HEALTH OF SCOTCH TOWNS.

In the 16 largest Scotch towns with an aggregate population estimated at 2,293,200 persons at the middle of this year, 1228 births and 686 deaths were registered during the week ended Saturday, May 30th. The annual rate of mortality in these towns, which had been 16·2, 15·3, and 16·1 per 1000 in the three preceding weeks, declined to 15·6 per 1000 in the week under notice. During the first eight weeks of the current quarter the mean annual death-rate in these towns averaged 16·0, against a corresponding rate of 14·3 per 1000 in the 97 large English towns. Among the several towns the death-rate during the week under review ranged from 5·9 in Clydebank, 8·5 in Leith, and 11·3 in Motherwell, to 20·6 in Paisley, 21·6 in Hamilton, and 24·1 in Kirkcaldy.

The 686 deaths from all causes were 23 fewer than the number in the previous week, and included 56 which were referred to the principal epidemic diseases, against 56 and 62 in the two preceding weeks. Of these 56 deaths, 23 resulted from whooping-cough, 17 from measles, 7 from infantile diarrhœal diseases, 5 from scarlet fever, and 4 from diphtheria, but not one from enteric fever or from small-pox. The mean annual death-rate from these diseases was equal to 1·3, against 1·1 per 1000 in the 97 large English towns. The deaths attributed to whooping-cough, which had been 17, 18, and 10 in the three preceding weeks, rose to 23, and comprised 19 in Glasgow, 2 in Paisley, and 2 in Coatbridge. The deaths referred to measles, which had been 31, 20, and 27 in the three preceding weeks, fell to 17; 7 deaths were registered in Glasgow, 3 in Dundee, 3 in Paisley, 2 in Edinburgh, and 2 in Hamilton. The fatal cases of diarrhœa and enteritis (among infants under 2 years), which had been 4, 6, and 14 in the three preceding weeks, fell to 7, of which 4 occurred in Glasgow and 2 in Aberdeen. The deaths attributed to scarlet fever, which had increased from 2 to 7 in the four preceding weeks, fell to 5, and included 2 in Glasgow. The 4 deaths referred to diphtheria, of which 2 were recorded in Glasgow, were 2 below the average in the earlier weeks of the quarter.

The deaths referred to diseases of the respiratory system, which had been 116, 104, and 107 in the three preceding weeks, declined to 96 in the week under notice; and 33 deaths resulted from various forms of violence, against numbers increasing from 16 to 32 in the three preceding weeks.

In the 16 largest Scotch towns 1293 births and 702 deaths were registered during the week ended Saturday, June 6th. The annual rate of mortality in these towns, which had been 15·3, 16·1, and 15·6 per 1000 in the three preceding weeks, rose to 16·0 per 1000 in the week under notice. During the first nine weeks of the current quarter the mean annual death-rate in these towns averaged 16·0, against 14·2 per 1000 in the 97 large English towns. Among the several towns the death-rate last week ranged from 9·4 in Falkirk, 10·1 in Motherwell, and 10·3 in Kilmarnock, to 17·6 in Glasgow and in Clydebank, 19·0 in Leith, and 20·0 in Paisley.

The 702 deaths from all causes were 16 in excess of the number in the previous week, and included 62 which were referred to the principal epidemic diseases, against 62 and 56 in the two preceding weeks. Of these 62 deaths, 19 resulted from measles, 19 from whooping-cough, 16 from infantile diarrhœal diseases, 3 from scarlet fever, 3 from diphtheria, and 2 from enteric fever, but not one from small-pox. The mean annual death-rate from these diseases was equal to 1·4, against 1·2 per 1000 in the 97 large English towns. The deaths attributed to measles, which had been 30, 27, and 17 in the three preceding weeks, slightly rose to 19 last week, of which 11 occurred in Glasgow and 6 in Dundee. The deaths referred to whooping-cough, which had been 18, 10, and 23 in the three preceding weeks, fell to 19, and included 11 in Glasgow, 2 in Paisley, and 2 in Clydebank. The fatal cases of diarrhœa and enteritis (among infants under 2 years), which had been 6, 14, and 7 in the three preceding weeks, rose to 16 last week, of which 8 were recorded in Glasgow and 3 in Aberdeen. The 3 deaths attributed to scarlet fever, which comprised 2 in Glasgow and 1 in Clydebank, were 2 below the average in the earlier weeks of the quarter. The 3 deaths from diphtheria were registered in Aberdeen and were 3 below the average in the earlier weeks. The fatal cases of enteric fever occurred in Glasgow and Hamilton.

The deaths referred to diseases of the respiratory system, which had been 104, 107, and 95 in the three preceding weeks, slightly rose to 99 in the week under notice; 22 deaths resulted from different forms of violence, against numbers increasing from 16 to 33 in the four preceding weeks.

HEALTH OF IRISH TOWNS.

In the 27 town districts of Ireland, with an aggregate population estimated at 1,205,250 persons at the middle of this year, 747 births and 412 deaths were registered during the week ended Saturday, May 30th. The annual rate of mortality in these towns, which had been 18·6, 18·2, and 18·9 per 1000 in the three preceding weeks, declined to 17·8 per 1000 in the week under notice. During the first eight weeks of the current quarter the mean annual death-rate in these towns averaged 20·3 per 1000; in the 97 large English towns the corresponding rate did not exceed 14·3, while in the 16 Scotch towns it was equal to 16·0 per 1000. The annual death-rate in the week under review was equal to 22·2 in Dublin (against 11·8 in London and 15·5 in Glasgow), 15·0 in Belfast, 18·4 in Cork, 7·6 in Londonderry, 17·6 in Limerick, and 17·1 in Waterford, while in the 21 smaller towns the mean rate was 17·3 per 1000.

The 412 deaths from all causes were 26 below the number in the previous week, and included 48 which were referred to the principal epidemic diseases, against 45 and 46 in the two preceding weeks. Of these 48 deaths, 19 resulted from measles, 11 from whooping-cough, 10 from infantile diarrhœal diseases, 6 from scarlet fever, 1 from enteric fever, and 1 from diphtheria, but not one from small-pox. The mean annual death-rate from these diseases was equal to 2·1, against corresponding rates of 1·1 and 1·5 per 1000 in the English and Scotch towns respectively. The deaths attributed to measles, which had declined from 45 to 18 in the four preceding weeks, were 19 in the week under notice, and comprised 14 in Dublin, 3 in Belfast, and 2 in Sligo. The deaths referred to whooping-cough, which had fallen from 14 to 7 in the six preceding weeks, rose to 11, of which 7 occurred in Belfast, 3 in Cork, and 1 in Dublin. The fatal cases of diarrhœa and enteritis (among infants under 2 years), which had been 3, 9, and 10 in the three preceding weeks, were again 10, and included 4 in Dublin and 4 in Belfast. The 6 deaths attributed to scarlet fever, of which 4 were recorded in Belfast, were 2 in excess of the average in the earlier weeks of the quarter. The fatal cases of enteric fever and diphtheria were registered in Dublin.

The deaths referred to diseases of the respiratory system, which had been 74, 86, and 79 in the three preceding weeks, rose to 85 in the week under review. Of the 412 deaths from all causes, 140, or 34 per cent., occurred in public institutions and 6 resulted from various forms of violence. The causes of 17, or 4·1 per cent., of the total deaths were not certified either by a registered medical practitioner or by a coroner after inquest; in the 97 large English towns the proportion of uncertified causes of death did not exceed 0·7 per cent.

In the 27 town districts of Ireland 552 births and 335 deaths were registered during the week ended Saturday, June 6th. The annual rate of mortality in these towns, which had been 18·2, 18·9, and 17·8 per 1000 in the three preceding weeks, further fell to 16·7 per 1000 in the week under notice. During the first nine weeks of the current quarter the mean annual death-rate in these towns averaged 19·9 per 1000; in the 97 large English towns the corresponding rate did not exceed 14·2, while in the 16 Scotch towns it was equal to 16·0 per 1000. The annual death-rate last week was equal to 19·9 in Dublin (against 12·7 in London and 17·6 in Glasgow), 16·6 in Belfast, 15·0 in Cork, 14·0 in Londonderry, 17·6 in Limerick, and 19·0 in Waterford; while in the 21 smaller towns the mean death-rate did not exceed 11·3 per 1000.

The 335 deaths from all causes were 27 below the number in the previous week, and included 35 which were referred to the principal epidemic diseases, against 45 and 48 in the two preceding weeks. Of these 35 deaths, 21 resulted from measles, 6 from whooping-cough, 4 from infantile diarrhœal diseases, 3 from diphtheria, 1 from enteric fever, and 1 from scarlet fever, but not one from small-pox. The mean annual death-rate from these diseases was equal to 1·6, against corresponding rates of 1·2 and 1·4 per 1000 in the English and Scotch towns respectively. The deaths attributed to measles, which had been 21, 18, and 19 in the three preceding weeks, slightly rose to 21 last week, of which 18 occurred in Dublin. The deaths referred to whooping-cough, which had been 8, 7, and 11 in the three preceding weeks, fell to 6, and comprised 4 in Belfast and 2 in Dublin. The fatal cases of infantile diarrhœa and enteritis, which had increased from 3 to 10 in the four preceding weeks, fell to 4 last week, of which 2 were registered in Dublin. The 3 deaths attributed to diphtheria, comprising 2 in Belfast and 1 in Dublin, were slightly in excess of the average in the earlier weeks of the quarter. The fatal case of enteric fever occurred in Dublin, and that of scarlet fever in Belfast.

The deaths referred to diseases of the respiratory system, which had been 88, 79, and 85 in the three preceding weeks, fell to 63 in the week under notice. Of the 335 deaths from all causes, 122, or 32 per cent., occurred in public institutions, and 6 resulted from various forms of violence. The causes of 17, or 4·4 per cent., of the total deaths were not certified either by a registered medical practitioner or by a coroner after inquest; in the 97 large English towns the proportion of uncertified causes of death did not exceed 0·7 per cent.

THE SERVICES.

INDIAN MEDICAL SERVICE: ANNUAL DINNER.

THE annual dinner in London of the Indian Medical Service was held on June 8th at the Hotel Cecil, under the chairmanship of Surgeon-General Percy Hugh Benson. The following were present:—Guests: General Sir Edmund Barrow, G.C.B., Military Secretary, India Office; Sir James D. La Touche, K.C.S.I., member of the India Office Council; Sir Thomas Barlow, Bart., K.C.V.O., President of the Royal College of Physicians of London; Sir Rickman J. Godlee, Bart., K.C.V.O., President of the Royal College of Surgeons of England; Sir Francis H. Champneys, Bart., President of the Royal Society of Medicine; Mr. Austin Low; the Editor of THE LANCET; and the Editor of the *British Medical Journal*. Sir David Ferrier, President of the Medical Society of London, was invited but was unable to be present. Members: Surgeon-Generals: Sir R. Havelock Charles, G.C.V.O., J. Cleghorn, C.S.I., A. M. Crofts, C.I.E., J. P. Greany, and G. W. R. Hay. Colonels: C. W. Carr-Calthrop, D. ffrench-Mullen, W. G. H. Henderson, H. Hendley, D. E. Hughes, M. D. Moriarty, R. D. Murray, A. Porter, and P. A. Weir. Lieutenant-Colonels: A. Alcock, C.I.E., W. Alpin, J. Anderson, A. E. Berry, W. H. Burke, W. H. Cadge, D. G. Crawford, R. H. Elliot, P. J. Freyer, G. H. D. Gimlette, C.I.E., H. Greany, P. de H. Haig, J. G. Hulbert, G. B. Irvine, E. R. Johnson, J. N. MacLeod, C.I.E., D. P. MacDonald, R. K. Mitter, T. R. Mulroney, A. H. Nott, S. E. Prall, K. Prasad, J. J. Pratt, B. J. Singh, W. H. Thornhill, D. Warliker, H. P. Woolbert, H. G. L. Wortabet, and F. W. Wright. Majors: S. H. Lee Abbott, C. R. Bakhle, F. L. Blenkinsop, F. D. S. Fayrer, J. K. Fleming, W. F. Harvey, E. C. Hepper, S. P. James, G. King, R. W. Knox, W. H. Leonard, W. T. McCowen, W. R. J. Scroggie, M. H. Thornley, J. N. Walker, and C. G. Webster. Captains: A. C. Anderson, C. H. Barber, D. P. Goil, A. F. Hamilton, L. Hirsch, J. L. Lunham, A. C. Munro, R. D. MacGregor, J. O'Leary, M. F. Reaney, H. Ross, T. C. Rutherford, W. D. H. Stevenson, and M. F. White. The toasts of "The King" and "The Indian Medical Service" were duly honoured, and, in accordance with custom, there were no speeches, but a number of songs were given by Madame Edith Grey-Burnand. The proceedings were thoroughly enjoyable, and the thanks of those present are due to Lieutenant-Colonel J. J. Pratt, honorary secretary of the dinner, for a most successful evening.

ROYAL NAVY MEDICAL SERVICE.

Surgeon John Courtenay Folliott Dudley Vaughan has been promoted to the rank of Staff-Surgeon in His Majesty's Fleet (dated May 19th, 1914).

ROYAL ARMY MEDICAL CORPS.

Surgeon-General W. Ford, D.S.O., has been selected for appointment as Deputy Director of Medical Services to the Northern Command Headquarters Staff.

Colonel T. P. Woodhouse has been appointed Deputy Director of Medical Services to the Aldershot Command.

Lieutenant-Colonel S. F. Clark has joined at Chester. Lieutenant-Colonel M. P. C. Holt, D.S.O., has been appointed to hold charge of the Cambridge Military Hospital at Aldershot. Lieutenant-Colonel A. T. I. Lilly, Officiating Assistant Director of Medical Services, Bombay Brigade, has been granted leave of absence. Lieutenant-Colonel W. E. Hardy has been appointed to hold charge of the Military Hospital at Calcutta on transfer from Allahabad Cantonment. Lieutenant-Colonel C. Dalton has been appointed Commandant and Director of Studies to the Royal Army Medical Corps Camp of Instruction at Longmoor, Aldershot. Lieutenant-Colonel A. P. Blenkinsop has been selected for appointment as Assistant Director-General at the Medical Division of the War Office in succession to Lieutenant-Colonel C. Burtchael, whose tenure of appointment expires in August next. Lieutenant-Colonel J. J. Russell has been selected for advancement to the higher grade of his rank under Article 358 of the Royal Warrant for Pay and Promotion.

Major H. B. G. Walton has been appointed to the Military Hospital at Ranikhet Cantonment. Major B. B. Burke has been placed under orders for transfer from the Military Hospital at Dover and appointed to hold charge of the Duke of York's School. Major G. T. K. Maurice has been transferred from Worcester to the Military Hospital at Tidworth. Major G. M. Goldsmith has arrived home for duty from Lebong Cantonment. Major A. W. N. Bowen has been transferred from the Belfast District to the Military Hospital at the Curragh. Major F. E. Gunter has been appointed to the Southern Command. Major M. Babington has taken up duty as Bacteriological Specialist at Queen Alexandra's Military Hospital, Grosvenor-road. Major J. Power has been appointed Specialist in Midwifery and Gynæcology to the Chatham District and placed in charge of the Military Families Hospital at Chatham. Major R. H. Fuhr, D.S.O., has taken up duty as Assistant Medical Officer in charge of the Royal Arsenal at Woolwich. Major G. B. Moore has been appointed to hold charge of the Medical Division at the Cambridge Military Hospital, Aldershot. Major M. M. Rattray has taken up duty at the Royal Herbert Hospital, Woolwich. Major G. J. A. Ormsby has arrived home for duty from the Military Hospital at Meerut Cantonment. Major A. H. Safford has been transferred from the Military Hospital at Colchester and appointed to hold medical charge of the Training Camp at Felixstowe. Major J. F. Martin has taken up duty in the Aldershot Command.

Captain E. C. Phelan has arrived home for duty from the Military Hospital at Barrackpore Cantonment. Captain H. C. Sidgwick has been appointed Specialist in Advanced Operative Surgery to the Herbert Hospital at Woolwich. Captain W. F. H. Loughnan has taken up duty at the Military Hospital, Hounslow. Captain M. B. H. Ritchie has been appointed to the Military Hospital at Colchester. Captain H. M. Thompson has joined at Aldershot. Captain C. G. Sherlock has been granted six months' general leave of absence home from India. Captain W. C. Nimmo has been appointed Specialist in Midwifery and Diseases of Women and Children to the Aldershot Command. Captain T. C. C. Leslie has embarked for India. Captain T. H. Dickson has been transferred from the Military Hospital at Bareilly to Ranikhet Cantonment. Captain C. Scaife has arrived home for duty from Belgaum Cantonment. Captain A. H. Heslop has arrived home from Rawal Pindi Cantonment. The following Captains have joined the Camp of Instruction at Longmoor:—H. A. Meadon, F. E. Roberts, O. Ievers, and M. O. Wilson. Captain K. A. C. Doig has been transferred from the Military Hospital at Meerut Cantonment to Chakrata. Captain R. D. O'Connor has arrived home for duty from the Military Hospital at Multan Cantonment. Captain D. M. Corbett has been appointed to the Western Command. Captain M. O. Wilson has arrived home for duty from Aden. Captain W. J. Tobin has been transferred from the Military Hospital at Madras to Bangalore. Captain F. Casement has been appointed to the Scottish Command. Captain W. Mitchell has joined the Military Hospital at Wrexham. Captain E. B. Lathbury has been transferred from the Cork District to Kilworth. Captain E. D. Caddell has been appointed to the Eastern Command. Captain J. A. Bennett has been transferred from Cork to Youghal. Captain C. W. Bowle has been appointed to hold charge of the Military Hospital at Enniskillen. Captain G. A. D. Harvey, specialist in physical training at the Royal Army Medical College, Grosvenor-road, has been appointed to the Egyptian Army. Captain W. K. Beaman has been appointed to the Northern Command. The following Captains have been detailed to attend the next course of instruction for promotion to the rank of Major at the Royal Army Medical College, Grosvenor-road, S.W.: R. G. H. Tate, R. J. C. Thompson, F. Worthington, C. W. Bowle, A. C. Elliott, W. E. Marshall, W. E. C. Lunn, W. Mitchell, and D. de C. O'Grady. Captain A. L. Foster has been transferred from the Second (Rawal Pindi) Division to the Aden Brigade. Captain A. G. Wells has arrived home for duty from Ambala Cantonment.

Lieutenant A. G. Bigham has embarked for duty with the Northern Army in India. Lieutenant E. A. Strachan has been transferred from Lucknow Cantonment to the Military Hospital at Bareilly. Lieutenant C. M. Ingoldby has been appointed to the Second (Rawal Pindi) Division. Lieutenant R. B. Phillips has been transferred from medical charge of the barracks at Tipperary to Cork. Lieutenant W. O. W. Ball has taken up duty at Bordon. Lieutenant F. C. Lambert has been appointed to the Military Hospital at Poona Cantonment. Lieutenant J. T. McEntire, at the termination of leave of absence, has been placed under orders to join the Irish Command. Lieutenant W. S. R. Stevenson has been transferred from the Karachi Brigade to the Fourth (Quetta) Division. Lieutenant R. Davidson has been appointed to the Military Hospital at Lucknow Cantonment on transfer from Hounslow. Lieutenant W. L. Webster has been placed under orders for duty in Egypt. Lieutenant E. B. Allnutt has been transferred from the Fourth (Poona) Division to the Military Hospital at Purandhar Cantonment. Lieutenant H. N. Sealy has taken up duty at Kildare. Lieutenant H. F. Panton has embarked for India. Lieutenant J. Hare has been transferred from the Military Hospital at Enniskillen to the Belfast District.

INDIAN MEDICAL SERVICE.

Lieutenant-Colonel G. F. W. Braide, Inspector-General of Prisons in the Punjab, has been appointed to officiate as Inspector-General of Civil Hospitals in the Punjab during the absence on leave of Colonel C. J. Bamber, M.V.O. Lieutenant-Colonel R. G. Turner, civil surgeon at Lucknow, has been appointed to the staff of the King George Medical College as Professor of Midwifery. Lieutenant-Colonel V. B. Bennett has arrived home on combined leave of absence from India. Lieutenant-Colonel A. Buist has relinquished charge of the District Jail at Campbellpore. Lieutenant-Colonel J. N. MacLeod, agency surgeon, has been granted ten months' combined leave of absence. Lieutenant-Colonel W. T. Irvine has joined at Peshawar. Lieutenant-Colonel B. J. Singh has arrived home on leave of absence from India. Lieutenant-Colonel P. B. Haig has been appointed Agency Surgeon to Bhopal State.

Major T. C. MacCombie Young, Deputy Sanitary Commissioner to the Government of Assam, has been granted three months' privilege leave of absence. Major H. J. Crossle, on return to India from leave of absence, has been appointed to hold civil medical charge at Hazara. Major H. Melville has taken up duty at Lahore. Major E. J. O'Meara, civil surgeon and Principal of the Government Medical School at Agra, has been granted three months' privilege leave of absence. Major J. Woods has been appointed to Burma for plague prevention duty. Major H. Austen Smith has been appointed to Simla. Major W. M. Anderson has been appointed to hold civil medical charge at Quetta. Major S. H. Burnett has joined at Calcutta. Major H. R. Nutt, civil surgeon at Muttra, has been granted privilege leave combined with furlough on medical certificate home from India for eight months. Major W. S. Willmore, civil surgeon at Sitapur, has been transferred to Agra and appointed to officiate as Civil Surgeon and Principal of the Government Medical College. Major M. H. Thornley has arrived home on leave of absence from India.

Captain R. S. Townsend, plague medical officer at Aligarh, has been appointed to officiate as Civil Surgeon at Agra, vice Major H. R. Nutt. Captain F. E. Wilson has been appointed to hold civil medical charge at Sibi. Captain H. C. Keates has been appointed Superintendent of the Multan District Prison, vice Major M. Corry. Captain F. F. S. Smith has arrived home on leave of absence from India. Captain R. E. Flowerdew has been appointed Civil Surgeon at Port Blair and Superintendent of the Cellular and Female Jails. Captain E. A. Walker has been appointed to officiate as Civil Surgeon at Meiktila. Captain J. C. G. Kunhardt has been appointed to the Bacteriological Department. Captain E. C. C. Maunsell, medical officer to the 94th Infantry, has been appointed to officiate as Civil Surgeon at Cochin. Captain J. O'Leary has been appointed to hold substantive medical charge of the 8th Cavalry.

SPECIAL RESERVE OF OFFICERS.

Royal Army Medical Corps.

The undermentioned to be Lieutenants (on probation):—John Alexander O'Driscoll, late Cadet Lance-Corporal, Royal College of Surgeons in Ireland Contingent, Officers Training Corps (dated April 27th, 1914). Ivan Millar Pirrie, late Cadet Colour-Sergeant, Durham University Contingent, Officers Training Corps (dated May 4th, 1914). Cadet Edgar Stanley Rowbotham, from the London University Contingent, Officers Training Corps (dated May 6th, 1914). From the Aberdeen University Contingent, Officers Training Corps (dated May 9th, 1914): Cadet Lance-Corporal Forster Heddle Brown Norrie, Cadet Robert Scott Cumming, Cadet Ian George Macdonald Firth, and Cadet Robert Boulton Myles. Cadet Sergeant John Forbes William Sandison (dated May 11th, 1914). Cadet Robert Daniel Lawrence (dated May 12th, 1914).

TERRITORIAL FORCE.

Royal Army Medical Corps.

3rd East Anglian Field Ambulance, Royal Army Medical Corps: Lieutenant Walter R. S. Roberts to be Captain (dated May 1st, 1914).

3rd North Midland Field Ambulance, Royal Army Medical Corps: Guy Fleetwood Haycraft to be Lieutenant (to be supernumerary) (dated May 1st, 1914).

1st Northumbrian Field Ambulance, Royal Army Medical Corps: Supernumerary Lieutenant Joseph W. Craven is absorbed into the establishment (dated April 1st, 1914).

Ronald Greig Badenoch (late Cadet, Durham University Contingent, Senior Division, Officers Training Corps) to be Lieutenant (dated April 28th, 1914).

1st London (City of London) General Hospital, Royal Army Medical Corps. The under-mentioned officers resign their commissions:—Lieutenant-Colonel Samuel West and Major Joseph A. Ormerod (dated June 6th, 1914).

4th Northern General Hospital, Royal Army Medical Corps: John Jekyll Rainforth to be Captain (dated May 1st, 1914). Major George W. Shipman resigns his commission (dated June 6th, 1914). Captain Edward C. Clements to be Major (dated June 6th, 1914).

East Lancashire Clearing Hospital, Royal Army Medical Corps: Thomas Blakeway Wolstenholme to be Lieutenant (dated April 8th, 1914).

Attached to Units other than Medical Units.—Jesse Robert Garrood to be Lieutenant (dated Feb. 27th, 1914).

CENTENARIANS.—Mrs. Mary Shelton, of Rowcroft, Stroud, Gloucestershire, celebrated the 102nd anniversary of her birthday on May 29th, and she walked to the local post-office to receive her old age pension.—Mrs. Rebecca Clark, the centenarian of Wood Green, North London, and said to be the oldest woman in England, celebrated the 110th anniversary of her birthday on June 9th.—Mrs. Ruth Turner died recently at Bolton, aged 101 years.

A new series of lectures on Modern Theories of Correcting Vision and New Aids to Vision (Punktal lenses, &c.), by Carl Zeiss, Jena, will be given with numerous experiments and demonstrations by Dr. O. Henker, at the Eye Clinic of the Berlin University during the week commencing June 17th. Further information can be obtained by ophthalmologists and surgeons from Herr Sanitatsrat Dr. Wertheim, Berlin W. 15, Meineckestrasse 5, or from Messrs. Carl Zeiss, 13–14, Great Castle-street, Oxford Circus, London, W. Lectures on the same subject will subsequently be given by Dr. Henker at Prague (Bohemia), Lund (Sweden), and Dresden, Munich and Düsseldorf (Germany).

NATIONAL ASSOCIATION FOR THE PREVENTION OF CONSUMPTION AND OTHER FORMS OF TUBERCULOSIS.—The preliminary programme of the sixth annual conference of this association, which will be held at Leeds on July 7th and 8th and of which the King is patron, has just been issued. It announces that a joint committee composed of various authorities interested in the prevention of consumption has selected the following subjects for discussion—namely, the house in relation to tuberculosis; tuberculosis, especially surgical, in children; and domiciliary treatment. The two first subjects will be discussed at the morning and afternoon sessions on July 7th respectively, and the third subject at the morning session of July 8th, a general discussion on all the subjects that have been under consideration taking place at the afternoon session of that day. It is hoped that the Duke of Devonshire, the Chancellor of the University of Leeds, will open the conference, and the opening addresses will be given by Sir William Younger, one of the members of the Royal Commission (Scottish) on Housing; Mr. R. Lawford Knaggs, Professor of Surgery in the University of Leeds; and Sir William Osler, F.R.S., Regius Professor of Medicine in the University of Oxford. There will be the usual excursions and social functions, which, however, have not yet been definitely arranged. Full particulars may be obtained from the Secretary of the Conference, 20, Hanover-square, London, W.

MEDICAL PRACTICE UNDER THE INSURANCE ACT.

(BY OUR SPECIAL COMMISSIONER.)

(Continued from p. 1641.)

XLVIII.—YARMOUTH: THE ACT AND THE BATTLE OF THE CLUBS.

Great Yarmouth, the popular Norfolk seaport and health resort, was formerly the field of a great engagement between the medical profession and medical aid associations, and it is now the seat of a struggle that threatens to be indefinitely prolonged. Perhaps it is because the profession but a short while ago was firmly united here that the prevalent discord is more keenly felt. Rarely have I come across such bitterness, or contemplated an outlook so sombre for those who had hoped that, given a little time for adjustment, the National Insurance Act would bring peace and goodwill. Not so long ago—that is, before the Insurance Act came into force—everyone who visited Yarmouth was agreeably impressed by the friendliness that prevailed between the medical men of the town. There was cordiality on all sides. To understand the meaning of this we must go back some 20 years, when the medical men of Yarmouth took a very active part in the battle of the clubs. These clubs or Friendly Societies formed an institute consisting of a federation of societies, and by importing whole-time medical officers they defied the attempts of the profession to improve the conditions of club or contract practice. At first the doctors were defeated, losing a great part of their club patients; but in the course of time the subscribing members of the institute became dissatisfied with the treatment supplied to them, and one by one they returned to their former medical advisers or to some independent practitioner, accepting the fair terms demanded. These were based on the principle of treating the men for only 4*s.* per year, but for the children 4*s.* each was also charged, and for the women 6*s.* The idea underlying the arrangement was that when the breadwinner is at work it is easier to pay for attendance on the other members of the family. In the struggle against the clubs the medical officers claimed the right to refuse to attend on members who were well-to-do; and this establishing of a wage limit was the principal reason that made the clubs federate and found an institute. On leaving the federation they accepted the wage limit.

At Yarmouth the profession was at this time so united that the boycott of the institute medical officers was very effective, and only one medical officer was serving its needs during the time the Insurance Bill was first discussed. It is unnecessary to say that but for the new legislation the profession at Yarmouth would have been completely victorious. But the Insurance Act has given the institute a new lease of life, and this alone has sufficed to arouse a strong feeling of resentment. It must be borne in mind that the battle of the clubs as conducted at Yarmouth had been no trivial contest, but a very serious matter. One of the Yarmouth practitioners told me the institute had taken from him so many club patients that he lost during the first year nearly £300. But some of the clubs came back to him, and many of the members returned to consult him as private patients, so that he ultimately recovered his loss. Other practitioners have similar stories to tell, and it follows therefrom that, having fought the battle of the clubs with a large measure of success, the medical profession in Yarmouth anticipated that the Insurance Act also could be resisted if it imposed upon them terms which they felt as a body to be inequitable.

How Yarmouth Yielded.

The fact that the resistance collapsed, in spite of such a favourable precedent, accounts for the present bitterness of feeling. The local division of the Association includes with Yarmouth Lowestoft and the surrounding country. To deal, however, with purely local matters the Yarmouth practitioners formed a medical guild. With the exception of the full-time medical men employed by the Friendly Societies' Medical Institute, all the Yarmouth practitioners belonged to the guild. Then there was also a social medical club to which a large number of doctors belonged. Thus there was much organisation that should have helped to keep the profession together and ensure their unity of action. Every practitioner in the town signed the pledge to resist the Act, even the whole-time men in the employ of the institute. This was in the summer of 1912, and they reiterated their undertaking in December, 1912. All remained of one mind until the Representative Meeting of the British Medical Association that was held towards the end of December. The delegates from the district to these meetings held in London by the Association were always instructed to vote against attempting to work the Act. It seemed as if everything was settled, and Yarmouth continued to hold out, though many other towns had yielded. At last some local practitioners began to ask that yet another local meeting should be convoked, and finally signed a petition to that effect. This could not be refused, and the meeting was called together. The tone by this time had changed. Much was made of the fact that Bradford had yielded, and a great deal was said about the threatened importation of doctors. This meeting took place early in January, and on the evening of the same day the Yarmouth doctors met the Insurance Committee, which was uncompromising in its stated intentions. An operating surgeon was to be imported, who would receive £1000 a year. Nine general practitioners were alleged to be coming, and these would be paid annually £500 each. The chairman of the Local Insurance Committee stated that Mr. Smith Whitaker, deputy chairman of the Insurance Commission and formerly medical secretary of the British Medical Association, had declared he could from his personal knowledge of the town indicate exactly where to place these medical men, so that a State Medical Service could be run to the best advantage, a statement that certainly could not have been made with Mr. Smith Whitaker's authority or knowledge. Some of the local practitioners were impressed by these threats, for there were five or six of them who might have been very seriously affected by the loss of their clubs if they did not go on the panel. But as many as 16 local practitioners joined the panel before they were relieved of their pledge. Nine refused service, and though now they are no longer bound by any pledge to resist they nevertheless are still holding out.

Faint Support for the Non-panel Doctors.

These nine have forwarded forcible appeals to the British Medical Association to stand by them, and have called upon headquarters to take some definite step to prove their sympathy, often asserted, with those who are resisting the Act. In January, 1913, when the question of contracting out was acute, a request was made that a speaker should be sent to Yarmouth to support dissentient views. The answer of the Association was to the effect that perhaps such a meeting was scarcely advisable as it might not be agreeable to the panel doctors, for it must be remembered that by this time the pledge had just been rescinded. The idea persisted that "the whole weight of the Association" had been promised to the men who held to their bond. Even after absolution from the pledge or pledges, therefore, this was considered an unsatisfactory reply, and the meeting was abandoned. The Association was now accused of showing sympathy rather with those who had broken than with those who had kept their pledge. The non-panel doctors of Yarmouth felt that they were not properly supported, and the panel doctors formed a Local Medical Committee without informing them. This was irregular, for the whole of the local profession is entitled to participate, and consequently another election had to take place. While the non-panel doctors were endeavouring to obtain a wide application of the contracting-out system, the panel doctors wanted the Insurance Committee to allot to them those insured persons who had not yet selected a medical adviser. Further, the two parties came into conflict as to what use should be made of the general hospital. As it is for the most part the leading medical men in the town who have not joined the panel they were able to exercise control over the hospital in this respect, even though a threat was made to persuade the Friendly Societies not to subscribe any more to the hospital fund. This challenge, however, was ignored, and the hospital remains independent of the panel and of the Insurance Act. But the members of the hospital staff complain that the panel doctors send their worst cases to them. Thus some of those medical men who refused to go on the panel have, as the honorary medical staff of the hospital, to do—and this, of course, for nothing—some of the most difficult part of the panel doctor's work.

A Land of Small Fees.

In the old club days there were many persons of small means who, though they belonged to clubs or Friendly Societies, nevertheless consulted private practitioners, especially if they were seriously ill. To-day, however, these persons can hardly afford to pay their share of the insurance money and continue giving fees to independent medical attendants. They are thus likely to avail themselves of their panel doctor more frequently than they did of their club doctor. At Yarmouth there is an unusually large number of people with small wages who constitute the back-bone of local medical practice. They only gave small fees, but they paid, at the accepted rate, for services rendered. Such patients were associated with the various phases of the fishing industry, as coopers, carters, and so on, or were employed at one of the several factories. Further, there are large drapery establishments. During the season a large proportion of even quite small householders engage in the precarious calling of letting lodgings, while a great amount of laundry work is done by the Yarmouth women. Then, after the holiday season is over, from September to December, some 5000 to 6000 Scotch women come to dress the fish. Lastly, there are the fishermen, some of whom sleep on shore in lodgings, though many remain on board their boats. All this represents a large population able to pay a few small fees. All these people are living on slender earnings, but they are not so poor as to be suitable recipients of charity. On the other hand, there is not an extensive prosperous middle-class in Yarmouth to leaven this mass of comparatively poor. There are few schools now which attract residents to Yarmouth in the way that schools in many seaside resorts appear to do. Society here consists of the tradesmen and a few professional families. This, therefore, is a town where the Insurance Act should improve the conditions of medical practice, at least from the financial point of view. The non-panel doctors do not deny this fact, but claim that it is all the more to their credit that they do not go on to the panel.

During the summer season the population is doubled, but the holiday folks are, generally speaking, a poor class of people. Many come from the East-end of London and only for three or five days. It will be understood how ardent, in such circumstances, the battle of the clubs must have been when so large a section of the population was living on, so to speak, the frontier line of contract practice. Still, as stated, this battle was fought, and the profession was not so much hurt by the clubs, particularly of late, when so many club patients had returned to the doctors they at first left to join the institute created by the Friendly Societies. Thus, after a battle of 20 years' duration, the profession were reaping the fruits of their victory when the Insurance Act threatened to destroy what they had gained. The indignation felt may be easily understood, though, as a matter of fact, the establishment of compulsory insurance has not impoverished but enriched a good many practitioners, while it has not so seriously damaged those who would have nothing to do with it. The truth is that the population of Yarmouth, as explained above, could not afford to spend much for medical attendance. The money now collected by the administration carrying out the Insurance Act has brought to the medical profession a larger sum than was ever before devoted to medical purposes. Thus it happens that while the incomes of the panel doctors have been considerably increased, those of the non-panel doctors have not proportionately diminished.

(To be continued.)

THE West African Medical Staff dinner will be held at the Grand Hotel, Charing Cross, London, W., on Monday, June 15th.

ASSOCIATION OF REGISTERED MEDICAL WOMEN.—A conference on tuberculosis was held in the rooms of the Medical Society, 11, Chandos-street, Cavendish-square, W., on June 9th, Dr. Jane Walker being in the chair. A discussion took place on the Present Position of Tuberculin Treatment. This was opened by Dr. Hilda Clark, late tuberculosis officer for Portsmouth, and among those who took part were Dr. Noel Bardswell, Dr. F. W. Burton-Fanning, Mr. H. J. Gauvain, Dr. Annie McCall, and Dr. Harrington Sainsbury. After tea there was a discussion on the Present Position of Sanatorium Treatment (*a*) for children, and (*b*) for adults, opened by Dr. Esther Carling and Dr. Esslemont respectively. Dr. Muriel Bywaters, Mr. George Finch, Dr. Alfred Salter, and Dr. Henry O. West took part in this discussion.

Home and Foreign Notes.

(FROM OUR OWN CORRESPONDENTS.)

BRISTOL AND WESTERN COUNTIES.

Decrease of Vaccination in Bristol.

THE decrease of vaccination still continues in the Bristol union. During April last the births numbered 683. 133 children were vaccinated and 179 conscientious objection certificates were received during the month.

Sanitary Inspectors' Association.

A meeting of the Devon and Cornwall branch of this association was held at Plympton on June 6th. Mr. J. Siddalls read a paper on Sanitary Legislation, and in referring to the Tuberculosis Order of 1913, said that if it was to be of any real utility it must be enforced with greater energy than had been the case. Other papers were read, and a discussion took place on the Pure Milk Bill; several members considered it would be a difficult matter to deal with the rural authorities. Other speakers hoped that the American plan of grading milk into "A," "B," and "C" classes would not be included in the Bill.

The Sanitary Condition of Dartmouth.

Dr. F. St. George Mivart, of the Local Government Board, recently reported in reference to some of the houses in the town, "It is difficult to understand how any sanitary authority can tolerate the existence of such dens as some of those visited." An inquest was held last week upon the body of an old man who died in a house which the medical witness described as "filthy," and the jury in their verdict added a rider urging the council to take early steps for better inspection and supervision of these houses. Dartmouth is visited by so many tourists in the summer months that it is to be hoped the local authorities will immediately remedy the present state of affairs.

Midwives and Medical Officers of Health.

Mr. S. Noy Scott, medical officer of health for the Plympton rural district, in his annual report for 1913 alludes to the inspection of midwives in Devon by an inspectress. Mr. Scott says that this lessens the control medical officers of health have over midwives. He is of opinion that this control should not have been taken away from the district medical officer of health, and the inclusion of ophthalmia neonatorum with the notifiable diseases increases Mr. Scott's opinion of this fact, since medical officers of health are responsible for the investigation of puerperal fever and ophthalmia neonatorum, and he contends that it is common sense for the officer whose duty it is to "control" these diseases should also be the officer to "control" one of the chief factors in their origin.

The Medical Officer of Health of Wiltshire.

At the last meeting of the Wilts county council it was decided to increase the salary of the medical officer of health from £600 to £700 per annum, and that of the deputy medical officer of health from £400 to £450.

Death of Mr. B. J. Collyer.

Mr. Bertram Joseph Collyer, L.R.C.P. Lond., M.R.C.S. Eng., died recently at his residence at Paignton, Devonshire, in his forty-fourth year, from pulmonary tuberculosis. He received his medical education at St. Bartholomew's Hospital and qualified in 1898. After holding resident appointments at the General Hospital, Birmingham, Mr. Collyer commenced practice at Paignton, where he soon became very popular. He was medical officer to the post office. Mr. Collyer was a keen yachtsman, and was a member of the Torbay Sailing Club, and took an active part in the annual Paignton Regatta. He will be much missed in Paignton and the district, and sympathy is widely felt there for his widow and two children.

June 9th.

SCOTLAND.

Child Study Society Conference in Edinburgh.

THIS annual Conference, again held in Edinburgh after an interval of 14 years, met on June 4th. Dr. John Macpherson is the local president, and Sir James Crichton-Browne, the President, delivered the opening address. Dr. Macpherson then submitted a paper entitled "A Plea for the Wider Recognition of the Instincts in Education." In the evening a civic reception was given in the City Chambers, and was largely attended. On the following day a paper on a Survey of the Recent Investigations and Criticisms on the Binet-Simon Tests was read by Miss Johnston. The paper dealt with these tests for the measurement of intelligence, and reviewed the present position with regard to the scale. In the afternoon the delegates were entertained to a garden party in the Scottish Zoological Park. On Saturday Mr. Cyril Burt, psychologist to the London County Council, delivered the last of the papers of the present meeting, entitled "Mental Tests." The Conference met with great success; the delegates numbered about 50, and the meetings were largely patronised on all available occasions by many interested.

Edinburgh Dinner of the Indian Medical Service.

This dinner was recently held in the Caledonian United Service Club under the chairmanship of Sir Alexander Christison, Bart. Among others present were Sir William Hooper, K.C.S.I., Sir Joseph Fayrer, Surgeon-General Turnbull, K.H.S., Surgeon-General Hay, Surgeon-General Sinclair, C.S.I., Colonel Arnott, Colonel Smith, and Colonel O'Halloran, R.A.M.C.

Association of School Medical Officers for Scotland.

At the annual general meeting of this association the following were elected office-bearers: President; Dr. Arbuckle Brown, Govan Parish. Vice-Presidents: Dr. Hally Meikle, Edinburgh; Dr. Kidd, Dundee. Secretary and Treasurer: Dr. John Hunter, Linlithgow. Council: Dr. Clarke, Edinburgh; Dr. Cameron, Glasgow; Dr. Jardine, Midlothian and Peebles; Dr. Mackenzie, Dunfermline; Dr. Roberts, Glasgow; and Dr. Sinnette, Greenock.

Maternity Benefit in Glasgow.

Recently the Glasgow Obstetrical and Gynæcological Society appointed a committee to inquire into the effect of the maternity benefit of the National Insurance Act in Glasgow. The committee have prepared a report dealing with the subject, and the general conclusion reached is that the maternity benefit under the Act has not promoted in Glasgow the comfort and security of mothers and infants to the extent that might have been hoped for. Information was obtained principally by means of a schedule of questions issued to 450 medical men engaged in general practice in the city, and also by inquiries made at the various institutions in the city where midwifery cases are treated. The outdoor cases of the Maternity Hospital in the first year of the Insurance Act are less by 967 than in the previous year, and there is a falling off in the number of cases at the Poor-law hospitals, so that there must have been a transference of work to other hands. The transference has apparently not been to the private practice of medical men, and it must have been mainly to midwives practising independently. In Scotland there is no State regulation of midwifery nurses, and many who practise as midwives are wholly untrained or without adequate training. Even if it be accepted that the trained nurse is now more frequently employed, still the untrained midwife continues in favour. Now that there is money available from the "maternity benefit," it is probable that housekeeping services, which before were rendered freely for friends or neighbours, have now to be paid for, and that the "handy woman" who will care for the house as well as the patient is preferred on that account to the midwife who carries on a practice, or to the well-trained nurse whose whole time could not be engaged by the poor, even if she were willing to undertake the housekeeping. The weight of opinion, as evidenced by the answers to the questions in the schedule issued to medical men, is against the view that there has been an increase of unskilled service, but the fact remains that the "handy woman" has not been eliminated by the operations of the Act, nor is she likely to be till there is a change in the administration of the benefit. Apart from these considerations the reduction in number of patients in the outdoor practice of the maternity hospital is likely seriously to hamper that portion of the work of the hospital which deals with the training of medical students and nurses.

Resignation of Professor James Musgrove, University of St. Andrews.

Professor James Musgrove has intimated his resignation of the chair of anatomy at the University of St. Andrews as from the end of the academical year. In accepting the resignation the University Court of St. Andrews resolved to record in the minutes its sense of the distinguished services rendered by Professor Musgrove to the study of anatomy and to the development of the medical school of the University.

Sick Children's Hospital in Dundee.

Mr. Frederick B. Sharp, of Hill of Tarvit, has offered under certain conditions to contribute the sum of £10,000 towards the cost of erecting and endowing a hospital for sick children in Dundee. The conditions are that the institution be managed by the directors of the Dundee Royal Infirmary, and that the necessary funds for building and endowing the said hospital be forthcoming within two years, otherwise the offer is to be withdrawn. At a recent meeting the infirmary board resolved to accept Mr. Sharp's generous offer under the attached conditions.

June 9th.

IRELAND.

The Medical Profession in Ireland and the National Insurance Act.

FOR the past ten months the Irish Medical Committee, as representative of the medical profession of Ireland, has been engaged in attempting to arrange with the Insurance Commissioners a satisfactory system for the certification of insured persons. At one time success seemed to be in sight, but other influences proved too strong.

and at present the Irish Medical Committee finds the position the same as it was last August. The Commissioners have as yet promulgated no scheme, but it is commonly believed that they intend shortly to appoint a number of whole-time and part-time medical certifiers to do all certification of the insured, to the exclusion of the medical attendants upon the insured. Recognising the gravity of the position, from the point of view of the insured public as well as from that of the profession, the Irish Medical Committee decided to put the history of the entire negotiations before the profession and the public. In consequence of this decision a mass meeting of the medical profession, at which representatives of the press were present, was held in the Mansion House, Dublin, on Tuesday, June 2nd. The chair was occupied by Dr. R. D. Purefoy, President of the Royal College of Surgeons in Ireland, and there was a very large attendance of members of the profession from all parts of the country. Mr. M. R. J. Hayes, medical secretary of the Irish Medical Committee, read a statement detailing the efforts made by that body during the past ten months to effect a settlement of the certification question. This was published substantially in the daily papers, and told a long story of baffled attempts to come to an understanding satisfactory to all parties and beneficial to the insured population. The following resolutions were then put and carried unanimously:—

That, in the opinion of this mass meeting of the medical profession, the medical attendant of the insured is in the best position to form a just opinion of his fitness or unfitness to work.

That any system of obtaining evidence of fitness or unfitness to work which ignores the opinion of the medical attendant will result in injustice to the sick insured, and will prevent their obtaining the benefits to which they are legally entitled.

That it is essential for the successful working of the sanatorium benefit of the National Insurance Act that the services of the general practitioner should be employed, both for the reporting of cases of tuberculosis and for carrying out domiciliary treatment.

Among those who spoke to the various resolutions were the Right Hon. Michael F. Cox, P.C., Sir Arthur Chance (past President of the Royal College of Surgeons), Mr. J. B. Story (President of the Irish Medical Association). Dr. J. S. Darling (Lurgan), Mr. J. S. McArdle, Dr. J. Power (Ardfinnan), Dr. J. C. McWalter (Governor of the Apothecaries' Hall), Mr. R. J. Johnstone (Belfast), and Dr. J. Cotter (Cork). Numerous instances were adduced by the speakers from their own experience of the failure of the sick insured to secure their benefit owing to the certificate of the patient's medical attendant being ignored. Many instances were also adduced of interference with treatment by the "medical advisers," whose only duty was to examine the patient and report to his society.

Annual Meeting of the Irish Medical Association: The Annual Dinner.

The annual meeting of the Irish Medical Association was held at the Royal College of Surgeons on June 3rd under the chairmanship of Mr. J. B. Story, the outgoing President. The annual report was received and adopted, and the report of the scrutineers of the ballot for officers and council was next submitted, showing that the following officers were elected:—President: Dr. F. W. Kidd (Dublin). Vice-Presidents: Ulster, Dr. Leonard Kidd (Enniskillen); Munster, Mr. James Keating (co. Cork); Leinster, Mr. J. B. Story (Dublin); Connaught, Dr. E. C. MacDowell (Sligo). Honorary secretary: Dr. T. Donnelly. Honorary treasurer: Dr. H. U. Byrne. The new President, Dr. F. W. Kidd, then gave a brief address dealing with the present position of the Association, and referred in particular to the decision of the British Medical Association to open a branch office in Dublin and to appoint a medical secretary for Ireland. He feared that jealousy between the two Associations would be aroused, but emphasised the advantages to the medical profession of Ireland of possessing an association of its own, and urged members to use their influence in recruiting. A discussion of the motions on the agenda followed, when Dr. Leonard Kidd proposed the appointment of a committee of seven to report to the council on a scheme for revising the articles of association "with a view to altering the method of electing the executive, improving the administration of the affairs, and extending the sphere of usefulness of the Association." It is generally admitted that the executive of the Association is cumbrous, consisting, as it does, of a president, four vice-presidents, an honorary secretary, an honorary treasurer, 32 members representing councils, 32 general councillors, and 5 *ex-officio* members—76 persons in all. Dr. Leonard Kidd's resolution led to a keen debate, as the question of affiliation to or amalgamation with the British Medical Association came under consideration. Most of the speakers felt that the present was an inopportune time for putting forward proposals for closer coöperation with any other association. Eventually the resolution was passed, and the nomination of the committee was left to the council.—The annual dinner was held on the same evening, Dr. F. W. Kidd presiding, Mr. Justice Dodd, the Solicitor-General, Mr. P. J. MacNamara, and Sir Charles Cameron being among the guests.

Royal College of Surgeons in Ireland.

The annual election for the President, Vice-President, Secretary, and Council has resulted as follows:—President: F. Conway Dwyer. Vice-President: William Taylor. Secretary: Sir Charles A. Cameron. Council: William Stoker, Sir Charles A. Cameron, Sir Lambert H. Ormsby, Richard D. Purefoy, Henry Gregg Sherlock, Sir Charles B. Ball, John B. Story, Sir Thomas Myles, Sir John Lentaigne, Sir Arthur Chance, F. T. Porter Newell, Shepherd M'C. Boyd, Sir Robert H. Woods, Richard Lane Joynt, R. Bolton McCausland, Thomas E. Gordon, R. Charles B. Maunsell, Trevor N. Smith, and William Ireland Wheeler. The new President, Mr. F. Conway Dwyer, is a graduate in arts and medicine of Trinity College. He is a Fellow of the College since 1898. He has been in turn surgeon to Jervis-street Hospital and to the Meath Hospital, and is at present surgeon to the Richmond Hospital. He is also professor of surgery in the School of the Royal College of Surgeons.

The Tuberculosis Scheme in Belfast.

After a long delay the committee of management of hospitals and dispensaries of the city corporation of Belfast have appointed, by coöption, three members out of the Local Insurance Committee, making this new corporation committee to consist altogether of 18 members. It was simply a question of money, as the Local Insurance Committee declined to grant—as they had the power—a sum of £10,000 towards the treatment of insured persons under the corporation's scheme for the treatment of tuberculosis, unless they had representation on the committee which is to run this new Belfast municipal scheme.

Typhus Fever in Belfast.

An outbreak of typhus fever has arisen. Two cases occurred last October, and in December the driver of the disinfecting van was attacked, and since that there were in all 11 cases up to May 5th. It was hoped the epidemic was over, but on May 9th, suddenly, a large number of cases occurred, most of them coming from two streets. In all, throughout the year 38 cases of typhus (quite an unusual number) were reported, although some of these were not undoubted cases.

June 9th.

PARIS.

The Dust on the Metropolitain Railway.

THE Conseil d'Hygiène of the Department of the Seine has for two years been pursuing an exhaustive inquiry on this subject. Of the two underground railroads in Paris the Nord-Sud furnishes only from 6 to 16 mgm. of dust, while the Metropolitain shows 134 mgm. The explanation of this difference lies in the fact that the rails of the Metropolitain are of ordinary steel and the brake shoes are of cast metal, whereas in the Nord-Sud the rails are of hardened steel and the brakes are made of a mixture of fibre and tar. Consequently in the first case the friction of stopping at a station adds materially to the supply of floating metallic particles, whilst in the second case the dust consists of organic matter. The proportion of this dust varies with the time of day. At 5 A.M. the atmosphere is limpid, the dust having settled during the night, but from the time the trains begin to run the amount increases progressively until they stop running at 1 A.M. The Conseil d'Hygiène, on the report of M. Kling, director of the municipal laboratory, has submitted to the Prefect of Police suggestions for increasing as much as possible the number of airholes on the underground and for substituting rails of hardened steel on the Metropolitain, at any rate near the stations, with the substitution of non-metallic brakes, such as are used on the Nord-Sud. He further recommends that in the stations the flooring of loose stones should be replaced by a paving easy to wash. The council has also dealt with the removal of the dust left by passengers in the carriages, which is becoming progressively dangerous notwithstanding the prohibition of spitting. The council forbids the dry cleaning at present in use, which is harmful for everyone, employees included. It proposes instead impermeable and washable floors for carriages, such as those of the Nord-Sud, and in the others cleansing at night in the depôts by means of damp sawdust.

Cheap Dwellings.

About 100 societies exist in Paris and its neighbourhood for the provision of hygienic dwellings for the poor, some of which—such as the Société Philanthropique, the group of workmen's houses, and the Weil and Rothschild foundations—possess considerable capital. The last-named, in particular, has 16,000,000 francs capital. These societies are for the most part prosperous, for notwithstanding the modest rentals the capital invested earns about 3 per cent., a rate of interest equal to that of the Funds. M. Ambroise Rendu in his report to the committee of patronage gives some very interesting statistics: the number of certificates of sanitation sought in 1913 in the Department of the Seine for such dwellings reached 1176, as against 1000 in 1912, 619 in 1911, and 495 in 1910. These certificates give to builders of cheap dwellings exemption from taxation for a certain number of years. The proportion of rejected applications was 25 per cent., the refusal dealing principally with collective houses, and being based on the lack of yard accommodation, the insufficiency of water-closets, and the inadequate space of the dwellings. These societies have already constructed 1281 individual or tenement houses for 12,000 inhabitants, of whom 7000 are children. The administration of the Assistance Publique itself, which has considerable capital at its disposition, has used part of it, at the instigation of the Conseil Municipal, in buildings of this kind. A departmental committee on cheap dwellings was created some years ago by the Government, and was charged with examining the plans of such projected buildings and granting or withholding its consent according to their compliance or otherwise with certain prescribed hygienic data. Failure to obtain this consent deprives these houses of the qualification of "cheap dwellings" and of the privileges accorded to the builders by law, especially of relief for 12 years from taxation and of security for interest. A very singular adventure has recently befallen the Administration of the Assistance Publique, which has applied 20,000,000 francs to the construction of cheap dwellings. Its architects have furnished for that purpose magnificent plans which at various exhibitions have had a gold medal awarded to them by competent juries. On June 27th 724 dwellings are to be begun and the city of Paris has agreed to a subvention of 100,000 francs for the projected structures. 7,698,000 francs have been already used in constructions, and new works to the extent of 9,000,000 francs are to be undertaken, for which the Assistance Publique, according to law, has submitted its plans for the approval of the Departmental Council of Cheap Dwellings. To the general surprise, this committee, after an examination of the plans, has refused its authorisation for their construction on the ground that they do not conform to the prescribed hygienic conditions. 59 per cent. of the buildings already constructed by the Assistance Publique have also been condemned for nonconformity with the regulations of 1910. A conflict has thus arisen between the departmental committee, which as a legally constituted body is independent and holds that its duty is to enforce the regulations, and the administration of the Assistance Publique, which contends that its plans have received the approval of all competent judges and that the regulations are inapplicable in certain particulars; for example, the obligation to leave 10 metres of unoccupied ground in front of each window, as laid down in the regulations, would condemn as not hygienic the greater part of the most beautiful buildings on the Champs Elysées, in which many of the inner courts have less than 9 metres in one of their dimensions.

Congress of Internes of the Hospitals.

The internes and former internes of the civil hospitals of towns possessing a faculty of medicine, in which these posts are awarded by competition, held a congress this week at Lyons, delegates being present from Bordeaux, Montpellier, Lille, Nancy, and other towns. Matters of professional interest relating to the welfare of the internes were dealt with in communications by Dr. Couchet, Dr. Winstel, Dr. Lesieur, and some present internes. The principal conclusion of the congress was the establishment of a permanent bureau. The next congress is to be held at Lille in 1916.

Statistics of Medical Students.

The Faculties of Medicine of the French Universities show for the current year 10,045 students, of

301 more than last year. The number of students in pharmacy remains almost stationary.

A Monument to Marey.

A monument erected by subscriptions from his friends and pupils has been unveiled to the memory of the great physiologist Marey in the park of the Institut International Marey at Boulogne-sur-Seine. The sculptor, Auban, has represented Marey seated, attentively examining a group of foot-runners, and above them a group of riders, in allusion to his researches on the analysis of movement. The President of the Republic himself delivered an address at the ceremony in which he traced the career of this brilliant physiologist.

"Audi alteram partem."

THE EARLY TREATMENT OF MENTAL DISEASE.

To the Editor of THE LANCET.

SIR,—The annotation in your issue of June 6th on the paper by Dr. Helen Boyle and the discussion thereon, again calls attention to the urgency of legislation regarding the early treatment of mental cases, and very wisely also, to the very important suggestion that neurologists and psychologists should work more together in these cases; and there can be no doubt that either of these sections of medicine at present, if acting alone in these cases, makes sometimes very deplorable mistakes—and many instances of such mistakes could be given. The early treatment of mental cases has unfortunately to be dealt with from the side of finance, since care with adequate supervision, outside the walls of an institution, must be of necessity an expensive matter. That in proper private care, with right social surroundings, and, above all, with adequate supervision, many early cases get well, no one with experience in this direction can for one moment doubt.

With regard to sending these patients to institutions for the insane, although under the voluntary boarder clauses this can be done and so certification be avoided, there is a great factor in the public mind against this plan being adopted—viz., the want in many such institutions of proper classification. I have for years maintained that these institutions should have several departments, and that the early quiet cases should have no chance of coming in contact with the acutely maniacal cases.

In the institution I managed for some years I had four departments for my cases, and a fifth one consisted of my own family circle. I have had early cases living with my family who got well without ever having come in contact with the other cases. Patients were often transferred from one department to another in the course of the day according to their mental condition, and I found this plan most beneficial.

On the other hand, in many institutions there are only two sides. On one side those who can enjoy a quiet social life are placed; and on the other side those who cannot enjoy such a social life are herded together. Individuality in treatment is thus to a great extent lost, and with its loss a much lessened chance of recovery is given. May not this absence of proper classification, and the loss of individual treatment have something to do with the grave fact that the recovery rate of insanity in institutions is not improving and has not improved for many years, and that in spite of the great advance in pathological knowledge, and the better accommodation, &c., given in institutions?

I am, Sir, yours faithfully,
LIONEL A. WEATHERLY, M.D. Aberd.

Bournemouth, June 6th, 1914.

THE PREVALENCE OF SYPHILIS.

To the Editor of THE LANCET.

SIR,—In a leading article in THE LANCET of April 4th, 1914, reference was made to a letter published in the same issue from Mr. A. Corbett-Smith, the editor of the *Journal of State Medicine*, who suggested that there is exaggeration on the subject of the dissemination of syphilis.

It is always difficult at a distance to appreciate the full significance of statistics, and it is not remarkable that Mr. Corbett-Smith should have been led to think that an infection of 0·5 per cent. of the population of Melbourne was an official estimate. Such a belief, however, is far removed from fact. In the course of the letter he stated that—

> In an address delivered at the Paris Congress of the Royal Institute of Public Health it was stated by a well-known doctor that, upon expert opinion, "about 7 per cent. of the whole population of Melbourne was syphilitic, or 40,000 cases out of a population of 600,000." Upon this basis he calculated 500,000 cases for Greater London. But I find that the official estimate for Melbourne is about 5 per 1000, or, say, 3000 cases.

Now the official estimate for the distribution of syphilis was not 0·5 per cent. No official estimate has ever been made. During the course of the comprehensive inquiry into the distribution of syphilis in Melbourne made by the Government of Victoria, under the direction of Dr. Burnett Ham, syphilis was made a compulsorily notifiable disease within a radius of ten miles of the General Post Office for 12 months, but there was practically no obligation, other than a moral obligation, on a practitioner to report cases. In any event, only suspicious cases were reported. So it came about that during the year 5500 cases were reported. Of 5000 of these 3167 were proved to be syphilitic. 900 of the cases, however, came from one hospital, and many practitioners did not report any cases, so that the figures in no way show the distribution in the population, except that they proved conclusively that *at least* 0·5 per cent. were syphilitic. But during four months of the year all cases visiting my clinic at the eye and ear hospital on Monday and Thursday and on Tuesday and Friday afternoons, were subjected to the Wassermann test irrespective of the disease for which they applied. The result was that of those who attended on Mondays and Thursdays 13 per cent. were found to be syphilitic, and of those who attended on Tuesdays and Fridays 15·8 per cent. were syphilitic, or of the whole 550 cases examined 13·3 per cent. The people who attended were not usually suffering from obvious syphilitic diseases. Very few cases were even suspicious. They came to the hospital for spectacle fitting, to have foreign bodies removed from the cornea, and so on.

The above are some of the *facts* relating to the Melbourne investigation of syphilis and show how it is that the misconception alluded to above has arisen. These facts were fully set out in *Bedrock* in January, 1913, and in the Proceedings of the Australasian Medical Congress, Sydney, 1911. Estimates of the distribution of syphilis can be best based on the results of the Wassermann method. There are other modes of investigation, such as the careful calculation of the distribution of general paralysis and tabes. It is, however, just as important to be sure that the extent is not under-estimated as it is that it should not be over-estimated.—I am, Sir, yours faithfully,

JAMES W. BARRETT, M.D. Melb., F.R.C.S. Eng.
Melbourne, May 6th, 1914.

DEFENSIVE FERMENTS OF THE ANIMAL ORGANISM.

To the Editor of THE LANCET.

SIR,—My attention has been drawn to the annotation on the Sero-Diagnosis of Cancer and the review of Professor E. Abderhalden's work on "Defensive Ferments of the Animal Organism," in the columns of THE LANCET of May 16th (pp. 1411 and 1399). The subject is one in which I am much interested, and I desire, at once, to associate myself entirely with you in admiration for the work of this distinguished scientist, the advances he has made in this important subject, the demonstration of specific protective ferments in the blood, and the serum tests he has devised in carcinoma and in pregnancy.

But may I point out that similar observations in regard to a defensive and induced tryptic and ereptic ferment response in the tissues in carcinoma, analogous to the ferment response in the bowel in normal processes of digestion, were published by me some years ago.[1] In particular, I referred to the intracellular ferment erepsin described by Vernon,[2] and to the facts of an increase of this ferment noted by him in the tissues investigated (kidney, liver, and cardiac muscle) in different conditions, and for instance in certain cases of cancer. This intracellular ferment increase seemed to me to be (*a*) similar to the adaptation or correlation of the various secretions and ferments to the different foodstuffs in the bowel in normal processes of digestion, described by Starling[3]; (*b*) to be called forth "irregularly, uncontrolled and unequal to the demand, save in rare instances of spontaneous cure"; or, (*c*) as I had suggested previously, "compensatory" in action.[4]

I should scarcely have ventured to trouble you but for the bearing such observations had, and have, on treatment. The production of trypsin and erepsin in the tissues was put forward by me in contradistinction to the administration of trypsin, and, alternatively, the use of prepared tissue extracts—normal, fœtal, and cancerous—was suggested. In this connexion at the time, and in view of Starling's work on "hormones" or chemical stimuli, I instanced a case of apparent recovery (three years) in sarcoma in the practice of the late J. H. Webb (Melbourne). He had treated the patient with prepared (acid) extract of fœtal tissues, and I suggested that it was not improbable "in thus administering an acid extract he may have been administering a fœtal 'secretin,' and that one or other excited the dissimilatory, breaking down, ereptic or tryptic ferment in his patient."

The principle of a ferment defensive response in the tissues is therefore now not only confirmed in the independent work of Abderhalden, as set forth in the annotation and review in your columns, but underlying methods of treatment by prepared tissues in inoperable cancer.

Furthermore, may I venture to point out that investigation of the blood in cancer and in other conditions has not been altogether neglected in this country. The opportunity of prosecuting work in this direction, and the modifications of the blood-serum exhibited after injections of various tissues, tissue extracts, and substances in animals, and after cancer inoculation, was afforded me by Professor W. D. Halliburton in the Physiological Laboratory, King's College, London. On the suggestion of Dr. Otto Rosenheim, investigation has been made on lipase, the fat-splitting enzyme of the pancreas, and partly in conjunction with him I published, in 1910, preliminary accounts of the results obtained.[5] Briefly, it was found that in certain cases of carcinoma the serum, while possessing no true fat-splitting action in itself, has the property of considerably increasing, accelerating, or activating the fat-splitting action of pancreatic extracts and pancreatic juice, compared with the action of normal serum. After injections with various tissues, tissue extracts, and substances in animals, as I showed later, and after inoculation with cancer tissue—prepared and fresh—and with cancer serum, this property is increased, while suggestions have been made by me from time to time not only in regard to the production of the fat-splitting ferment as a factor in the protective processes but in regard to sero-diagnosis and treatment.[6]

I am, Sir, yours faithfully,
June 4th, 1914. J. A. SHAW-MACKENZIE.

THE PLEA FOR IMMEDIATE OPERATION IN APPENDICITIS.

To the Editor of THE LANCET.

SIR,—After a quiescent interval of two years Sir George T. Beatson, in THE LANCET of May 30th, again advocates the policy of "wait and see" in the treatment of acute appendicitis which has existed for from three to four days.

By taking up this position Sir George Beatson makes one of two alternative claims. He must maintain either (1) that all perforated and gangrenous appendices *are* surrounded by localising adhesions, or (2) that he is able by the eye of faith to see, in a given case, what is happening within the abdomen. There is no alternative position. Both claims are equally indefensible. That in all cases the appendix is walled off is contrary to the experience of operating surgeons. At the Liverpool meeting of the British Medical Association in 1912 I gave a series of consecutive cases[1] in which in 46 per cent. of the patients there was a septic focus without any protective adhesions. It is difficult to believe that these patients would have had a better chance without than with operation. During the discussion at the meeting and in the columns of a contemporary[2] I challenged Sir George Beatson to tell us *how* he can judge accurately of the condition of the appendix in a given case, how he can determine whether or not it is shut off by adhesions, and how he can foretell the future course of the disease—whether resolution will occur or whether gangrene with diffuse peritonitis will ensue. The answer has yet to come! I venture to think that no one dare claim such clinical acumen. And yet nothing short of such insight and prophetic talent can justify procrastination in a case of acute appendicitis.

[1] Brit. Med. Jour., 1912, vol. ii., p. 873

There are still over 2000 deaths from appendicitis annually in England and Wales, and this high mortality rate will continue until the teaching prevails that operation should in every case be performed as soon as possible. It should not be necessary to discuss the question whether or not to operate during the third and fourth days of the disease: operation should be performed within the first 48 hours. As Dr. John B. Murphy wrote as long ago as 1890, "every case of appendicitis brought to the surgeon with pus outside the appendix is incontrovertible proof that the case was badly managed up to that time."

I am, Sir, yours faithfully,
HERBERT J. PATERSON.

A PRINCIPLE OF DIETETICS.

To the Editor of THE LANCET.

SIR,—I notice that in your issue of June 6th Dr. J. Sim Wallace takes me to task for having told a lay audience that it is absurd to instruct mothers of the working classes to give their children raw fruit at the end of every meal in order to cleanse their teeth. Well, Sir, with all deference, I think such instruction *is* absurd. In the first place raw fruit at every meal all the year round is a luxury which poor people cannot afford, and in the second place I venture to think that even if it could be afforded it would do the children's digestion more harm than it would do good to their teeth.

I hope, however, that Dr. Wallace will succeed in his desire to start a discussion in your columns on oral sepsis and its prevention. As a small contribution to it, may I suggest that the pathological consequences of oral sepsis tend at the present moment to be greatly exaggerated?

I am, Sir, yours faithfully,
ROBERT HUTCHISON.
Queen Anne-street, W., June 9th, 1914.

To the Editor of THE LANCET.

SIR,—I gather from Dr. J. Sim Wallace's letter in your issue of June 6th that Dr. Robert Hutchison is horrified at the idea of a child eating a raw apple at bedtime (or after its last meal), and neither Dr. Hutchison nor Dr. Wallace appears to approve the old adage, "Eat an apple going to bed and make the doctor beg his bread." My own experience is quite in its favour. An apple eaten after the last meal, which, of course, is better taken at least two hours before bedtime, leaves the mouth in a clean and comfortable condition, is a good aperient, and can hardly be a serious difficulty to the digestion. But children are often supposed to need some *bonne bouche* to go to bed on. Would Dr. Hutchison say an apple is more injurious than cake or chocolates? I should prefer the apple if some sacrifice must be made to Moloch. I enclose the instructions issued in this borough. Dr. Wallace is mainly responsible for them, but Dr. Hutchison was consulted. I hope the alterations made in deference to his opinion will have exempted the instructions from his condemnation.

I am, Sir, yours faithfully,
SIDNEY DAVIES.
Public Health Department, Town Hall, Woolwich,
June 8th, 1914.

"PURELY MOTOR" NERVES.

To the Editor of THE LANCET.

SIR,—In connexion with your annotation in THE LANCET of June 6th on Dr. J. Ramsay Hunt's paper on "The Neural Atrophy of the Muscles of the Hand, without Sensory Disturbances," a strong protest ought to be, I think, made against his statement that the thenar branch of the median and the volar branch of the ulnar are purely *motor* nerves. Not only is this incorrect, but there is no known instance in any vertebrate of a purely *muscular* nerve which does not contain afferent fibres. In short, there is no such thing as a purely *motor* nerve. Let us take the thenar and the volar nerves: the muscles which are supplied by them receive no other nerve-supply; now anyone can by squeezing his own thenar and hypothenar muscles satisfy himself that they receive afferent algetic nerve fibres; therefore the thenar and volar nerves convey these afferent fibres. The experimental proof of the truth of my contention is so easy that I forbear to point out how it can be proved experimentally that these two branches are mixed nerves like all the other 20 or 30 purely *muscular* branches which exist in man. Now Dr Hunt bases his conclusion that the thenar and volar branches are purely *motor* solely on his failure to find sensory changes in any of his cases; but it is to be noted that nowhere in this paper of his (April, 1914) nor in any of his earlier papers on this subject in American journals does he state whether he applied digital or algometric deep pressure over the atrophied muscles; the only objective sensory tests mentioned by him are those for touch, pain (by which he probably means pin-prick), and temperature. But even the algometer might fail to settle the matter, because even if the algetic afferent fibres passing to these atrophied muscles were completely degenerated there would still be at least some pain on firm pressure of the skin over them on account of the preservation of cutaneous sensibility; but a careful comparison between the two sides might possibly show at least a slight diminution of pressure-pain sensibility on the affected side. Apart from this possibility—one which has apparently never yet been tested in one of these rare cases—there is only one way by which the matter could be effectually tested in a living man—viz., by cutting down on the atrophied muscles and then squeezing or compressing them; in this manner the element of cutaneous sensibility would be eliminated. As the pathological basis of Dr. Hunt's syndrome is doubtless, as he teaches, a slow compression neuritis (really nerve degeneration) of these two muscular nerves, I feel convinced that sensory changes are really always present in these cases in the shape of a relative diminution of the muscle-pain sensibility on the affected side. We cannot and never shall be able to tell whether it is entirely lost because the crucial experiment is never likely to be tried on a patient in the manner which I have just indicated. I need hardly say we are all grateful to Dr. Hunt for telling us of the existence of this important, though relatively rare, group of thenar and hypothenar atrophies. But purely *motor* nerves have no existence.

London, N.W., June 6th, 1914.

THYROID INSUFFICIENCY.

To the Editor of THE LANCET.

SIR,—The interesting letter of Dr. C. W. Crawshaw in THE LANCET of May 30th on Thyroid Extract in Nervous Disorders leads me to call attention to another class of cases in which there seems to be some insufficiency of thyroid secretion, although not enough to cause the classic symptoms of myxœdema. My attention was called to this class of cases some years ago by my friend Dr. Morgan Dockrell, of London, and since then I have met several, all of which have been much benefited by the administration of thyroid extract. The following case is typical.

A middle-aged man, organically sound, had suffered for many years from bad circulation, feelings of cold, and liability to chill. His temperature was usually about 1°F. below the normal. In winter he had to use an enormous quantity of bedclothes, and, even with those, he usually woke up feeling cold and miserable. There was breathlessness on exertion. He had become quite bald in early life. After taking thyroid extract for a little while he began to experience an unwonted feeling of warmth. Cold feet and hands became warm. He gradually dispensed with some of the bedclothes, so that he now uses only about one-third as much as formerly. The temperature rose to normal. The heart's action became stronger and steadier, and he can now take violent exercise which was formerly impossible. The progressive loss of hair has ceased, and the scalp, which was formerly as polished as a billiard ball, now shows an abundant growth of downy hairs. The amount of hair on the body has also increased. The patient feels quite a new man and much more vigorous than formerly.

I have had several other cases in which alleviation of similar symptoms has been brought about by thyroid extract, and it seems, I think, quite evident that the extract supplies something which in these instances is wanting in the system.

I am, Sir, yours faithfully,
JOHN P. HENRY, M.D., B.Ch. Dub.
Galway, June 1st, 1914.

LONDON PANEL COMMITTEE AND THE SUPPLY OF LOCUM TENENTS.

To the Editor of THE LANCET.

SIR,—Our attention has been drawn to the report in the *British Medical Journal* Supplement of May 30th last of a meeting of the London Panel Committee which was held on May 25th. That committee passed a resolution undertaking to supply "deputies" to panel practitioners, and we learn with no slight astonishment that the proposal was stated to have met "with the approval of the medical and transfer agencies."

As we have never been approached on the matter we take this opportunity of informing the medical profession that we strongly object to this unauthorised assertion, and the more so as we know that the above committee further discussed the question of undertaking the transfer of practices.

Whilst reserving our opinion as to its statutory powers to transact such business, we are reluctant to believe that medical men can be in sympathy with this movement.

We are, Sir, yours faithfully,
J. FIELD HALL
(Field Hall, Ltd.).

MUST THE DOCTOR BE A COMMON INFORMER?

To the Editor of THE LANCET.

SIR,—As the matter is of such grave moment I wish to draw your readers' attention to the decision of the General Medical Council in one of the recent penal cases.

A practitioner attended a female who had had a miscarriage. She pledged him to secrecy. The patient died from peritonitis. The doctor being bound by law to certify the "cause of death" wrote in his certificate "peritonitis and cardiac failure." Because he did not also state the concomitant fact of the abortion the General Medical Council concludes that he has been properly convicted of a misdemeanour. It is not permissible to say more, for the case has not formally concluded, but the opinion already given by the General Medical Council seems to lay a new burthen on practitioners

1. Cause is usually interpreted in law to mean immediate operative antecedent. Now it seems we must not only give immediate cause of death, as peritonitis, but, under peril of being unfrocked, the cause of peritonitis, as dirty instrument; the cause of virulence of dirt, as streptococci; the cause of activity of streptococci, as mixed infection, &c.

2. Every medical man in practice is often asked to bring about abortion. This alone being a criminal offence, it would seem he is bound to hand over the offender to justice.

3. Transmission of contagious disease being a grave offence, it would seem that to prevent this misdemeanour the doctor is bound to notify the wife or other person likely to be affected by the patient suffering from infectious sore.

I am, Sir, yours faithfully,
J. C. MCWALTER, M.D., LL.B.,
Barrister-at-Law.
Dublin, June 7th, 1914.

SOCIETY OF TUBERCULOSIS OFFICERS.

To the Editor of THE LANCET.

SIR,—With reference to Dr. Thompson Campbell's letter on the above subject, in your issue of to-day's date, may I say that I recently joined the Tuberculosis Society (secretary, Dr. W. O. Pitt, Walthamstow, Essex), and that I was informed that this body already numbered about 60 tuberculosis officers amongst its members?

I am, Sir, yours faithfully,
TUBERCULOSIS OFFICER.
June 6th, 1914.

THE NATIONAL INSURANCE ACT.

FRIENDLY SOCIETIES AND NATIONAL INSURANCE.

AT the annual conference of delegates from the lodges of the Manchester Unity of Oddfellows held at Aberystwith, and at the annual meeting of delegates of the Hearts of Oak Benefit Society held in London, the effects of national insurance upon the position of these important societies occupied a prominent place in the presidential addresses delivered. In each case satisfaction was expressed at the increased membership and at the proportion of members who had joined for the purposes of State insurance and had also insured independently. Both chairmen spoke of the suggestion that voluntary State insurance might some day take the place of the present compulsory system, the chairman of the Oddfellows saying:—

> Compulsory insurance has come, and it has come to stay. No thinking man attaches any importance to the purely tactical suggestion that a voluntary measure of insurance could now be substituted.

The president of the Hearts of Oak meeting said on this subject:—

> I am strongly opposed to any legislation which will bring about the abolition of the compulsory principle of the Insurance Act, first, because we all know that the Act would not have been required if it had not been for the millions of people who would not voluntarily join any Friendly Society, and who, by their apathy and indifference, really constituted a serious danger to the community; and, secondly, in the interests of the Approved Societies themselves, who, having now got new machinery to meet the new conditions, are beginning to breathe more freely with the improved working of the machine.

The latter speaker made the following remarks upon the subject of alleged excessive expenditure upon sickness benefit:—

> Referring to the experience of the working of the Insurance Act in regard to sickness, he saw no reason to pay too much attention to the alarmist rumours which were rife a few months ago. In regard to the alarm in certain quarters as to the abnormal sickness experienced by women members, while he agreed that very great caution was necessary, he did not share the pessimistic views expressed in many quarters.

The chairman of the Manchester Unity condemned the administration of sickness benefit by competing Approved Societies, amounting, he stated, to 23,500, as producing lack of uniformity and confusion. He predicted that at no very distant date the State would undertake the administration of the Act through its own officials, and he believed that the change would be advantageous to the voluntary thrift movement. With regard to the inequalities arising under the present system of administering sickness benefit, he said:

> Some Approved Societies, notably those connected with trade unions, administer sickness benefit as though it were intended to relieve not only sickness but also unemployment and that morbid disinclination to work which is so prevalent amongst some classes of the community. Others interpret the phrase "incapable of work" so strictly as to deny sickness benefit in some cases to those who are legitimately entitled to it.

ABERDEENSHIRE INSURANCE COMMITTEE.

At a meeting of the Aberdeenshire Insurance Committee held on May 29th the communication of the executive committee of the Scottish Association of Insurance Committees, inviting opinion as to the desirability of amending the Act with the view of empowering the Commissioners to dispense with the necessity of county committees constituting district committees, came up, and it was unanimously decided to approve the resolution. With regard to dispensing by medical practitioners, the committee decided that those doctors who dispensed their own medicines before the Act came into operation should be allowed to continue to do so, and that those doctors who did not dispense medicines prior to the inauguration of the Act should not be allowed to do so now. The report of the finance subcommittee in connexion with the 20 per cent. deduction on doctors' payments and chemists' accounts was adopted, with the addition of a resolution that the committee make immediate representation to the Insurance Commissioners to the effect that protests had been received from the chemists and doctors against the action of the committee in not fulfilling their bargain, and that the committee be immediately placed in funds to pay both the chemists and the doctors 95 per cent. of the amounts due to them.

Medical News.

UNIVERSITY OF CAMBRIDGE.—Dr. C. S. Myers, Director of the Psychological Laboratories, gives notice that during the Michaelmas term he will give a course of lectures in the Psychological Laboratory on General and Experimental Psychology, considered especially in relation to Medicine. These lectures are intended for medical students and for candidates for Part I. of the Diploma in Psychological Medicine. They will be given on Mondays, Wednesdays, and Fridays, at 9 A.M., beginning on Friday, Oct. 16th, and in connexion with them a practical class will be held. Those who wish to attend this course are requested to inform Dr. Myers before August 1st. Instruction in the physiology of the central nervous system, suitable for the above-named candidates, is provided in the course of lectures given by Dr. H. K. Anderson in the Physiological Laboratory on Tuesdays, Thursdays, and Saturdays, at 9 A.M. (beginning on Oct. 15th), with practical work on Mondays, Wednesdays, and Fridays, at 10 A.M.—The following medical degrees have been conferred:—

M.D.—A. H. Gosse, Caius; E. G. White, Christ's.
M.B., B.C.—M. H. Watney, Trinity; G. Sparrow, Caius.
M.B.—C. W. Archer, Trinity; H. J. S. Shields, Jesus.

BRITISH HOSPITALS ASSOCIATION CONFERENCE.—As we have already announced, the fifth annual conference of the British Hospitals Association will be held in the library of the Royal Victoria Infirmary, Newcastle-on-Tyne, from June 18th to 20th, under the presidency of the Lord Mayor of Newcastle, Sir George Hare Philipson acting as deputy chairman. Among the papers to be read is one by Dr. G. H. Hume on the Voluntary Hospital on its Trial, while Mr. P. J. Michelli, C.M.G., will open a discussion on Pensions for Hospital Officers. The association, of which Sir William Osler is the retiring president, has done much useful work in connexion with hospital economy and management.

THE BROWN INSTITUTION.—The annual report of the superintendent of the Brown Animal Sanatory Institution (Mr. F. W. Twort) has been received by the Senate of the University of London, and states that in the year 1913 the total number of examinations of animals made was 7036 and the total number of animals brought to the institution was 6022, of which 565 were in-patients at the hospital. Animals under treatment included 3956 dogs, 1355 cats, and 535 horses, the commonest diseases being distemper, mange, and scabies in dogs and lameness in horses. It was estimated that 400 animals were sent away to veterinary surgeons, treatment being refused on the grounds that the owners could afford to pay the proper fees. Of the 565 in-patients, 520 were cured or relieved, 17 died, and 28 were destroyed as incurable.

The research work of the laboratory attached to the institution included investigations on the thyroid gland, Johne's disease, tuberculosis, leprosy, and infantile diarrhœa, the last investigation being carried out for the Local Government Board.

Dr. Benjamin Moore, F.R.S., Johnston Professor of Bio-chemistry in the University of Liverpool, has accepted an appointment at the laboratory at Mount Vernon, Hampstead, which is to be opened in October next for research work under the National Insurance Act.

THE REBUILDING OF THE CHELSEA HOSPITAL FOR WOMEN.—On Tuesday last the foundation stones of the new Chelsea Hospital for Women and of the Nurses' Home in connexion with it were laid by the Earl and Countess Cadogan, the site having been generously furnished by Lord Cadogan.

THE NEW TREASURERS OF ST. GEORGE'S HOSPITAL.—Lord Greville and Sir Gerard Lowther have accepted the invitation of the committee of management of St. George's Hospital to become joint honorary treasurers of the charity, filling the vacancies caused by the recent resignations of Lord Plymouth and Mr. A. W. West.

RESEARCH DEFENCE SOCIETY.—The annual general meeting will be held at the house of the Royal Society of Medicine, 1, Wimpole-street, Cavendish-square, W., on Tuesday, June 30th, at 4.30 P.M. The president, Lord Lamington, will give an address, and the annual report will be submitted for adoption. After the business of the meeting there will be a demonstration with the kinematograph.

BRUSSELS MEDICAL GRADUATES' ASSOCIATION.—A dinner of this association will be held under the presidency of Dr. Howard Humphris at the Garden Club, Anglo-American Exhibition, on Wednesday, June 17th, at 7.30 P.M. All graduates of the University of Brussels will be welcome, and members are invited to bring ladies. Tickets, price 7*s.* 6*d.* (not including wine), may be obtained from the honorary secretary, Dr. Arthur Haydon, 29, Broadhurst-gardens, Hampstead, N.W.

ROYAL INSTITUTE OF PUBLIC HEALTH.—Dr. L. Vaillard, Inspector-General in the French Army Medical Service, will deliver the Harben lectures on Wednesday, Friday, and Monday, July 1st, 3rd, and 6th, at 5 P.M., in the lecture room of the institute, 37, Russell-square, W.C. He has taken as his subjects: (1) "Carriers from a Public Health Point of View"; (2) "The Etiology and Prophylaxis of Tetanus from a Consideration of Researches of the Past 30 Years"; (3) "House Flies and Public Health." All interested are invited to attend, and communications should be made to Dr. E. W. Hope, honorary secretary of the institute.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

The Milk and Dairies Bill.

A BETTER reception was given to the Milk and Dairies Bill on second reading in the House of Commons on Tuesday, June 9th, than was the fate of previous measures dealing with the same subject in recent years. In such a Bill as this pains have to be taken to meet the objections of the agricultural interest. The first speaker in the debate, Mr. CHARLES BATHURST, who represents an agricultural constituency, made it clear that the compromise which was alluded to on the introduction of the measure was accepted. The honourable Member went on to say that the Central Chamber of Agriculture and other leading agricultural organisations unanimously asked the House to accept the second reading of the Bill. They, however, hoped that no drastic amendments would be introduced in committee such as would destroy the compromise. He thought that there ought to be a certified supply of milk as was in force in the United States.

Criticism of the Bill was confined to details, and as a rule it was of a friendly character. Dr. ADDISON, who considered the Bill immensely valuable, thought that the Government ought to have proceeded by investing the larger authorities rather than the smaller ones with powers of action under the Bill. He made an important point by asking that the reports on milk-supplies should be made by medical officers who had a reasonably secure tenure. He also supported the contention that the certification of milk should be introduced into the Bill. A grading of milk would create public favour for clean milk. Mr. H. FORSTER regretted that the Bill did not deal a little more thoroughly with milk-supply as a whole. He admitted that it would do something to punish impurities, but it would not make the supply cheaper or more plentiful.

Mr. ASTOR dealt at some length with the provision of the Bill forbidding the sale of tuberculous milk. The country, he thought, could not afford by a stroke of the pen to wipe out 10 per cent. of the milk-supply. In his opinion the improvement ought to be made by a process of gradually raising the standard and by grading and classifying the milk. In the course of the subsequent debate a general agreement was disclosed on the desirability of securing a pure milk-supply, but various Members took objection to the provisions for the taking of samples for dealing with suspected cows, for the inspection of labourers, and also as to the compensation to be paid to farmers.

Mr. HERBERT SAMUEL, President of the Local Government Board, who is in charge of the Bill, replied to the debate and expressed satisfaction at the friendly reception which had been given to the Bill. He would, he said, approach the consideration of amendments with an open mind. He was particularly glad that the spokesmen of the agricultural interest had on the whole expressed a favourable opinion of the measure. Of course, he regarded milk producers not as persons to be harassed, but as persons whose business was indispensable to the nation. It was essential to maintain the cheapness of the milk-supply, and the Bill would be mischievous indeed if it sent up the price to the poorer classes. He did not believe that it would do anything of the sort. The regulations which the Government had in view were not designed to impose expense, but to enforce care. With regard to the authorities who were to administer the Bill, it had been urged that these should be the county and not the district authorities. But he would remind the House that in this matter it was not dealing with a *tabula rasa*. The district councils had the administration of the Diseases of Animals Acts. They already appointed inspectors to inspect the cattle, and there would be much complaint if the county councils were required to appoint another set of veterinary inspectors. If there was a general desire for the codification of the law relating to the milk-supply after the Bill passed, he should be glad to introduce a measure to bring all the existing law on the subject into one statute. Some honourable Members had taken objection to the inspection of labourers under the Bill, but the object of the provision was to secure that persons who were dirty should not contaminate the milk. There was also the case of the person with diseased hands. It was certainly essential to deal with that point. He did not view with any favour the proposal to have certified or graded milk, if that was to be a substitute for the proper regulation of the whole of the milk-supply. It would not be enough to say that the wealthy and well-to-do classes could obtain proper milk by paying for it and to leave the rest of the community without full protection. That was not a policy which could commend itself to the House of Commons. But the principle of the certification of milk was one which had very much to commend it. He did not introduce it into the Bill because he wanted to proceed very cautiously. He was quite content to leave that subject to be discussed in committee. If it appeared that a proposal was desired to protect those who chose to certify milk and to penalise those who wrongly claimed that the milk which they sold was certified, then he would be quite prepared to be guided in that matter by the committee. He sincerely trusted that the Bill would become law this year.

The second reading was agreed to without a division.

Milk and Dairies (Scotland) Bill.

The second reading of the Milk and Dairies (Scotland) Bill was also agreed to after a very brief debate. It was stated that the apprehensions of agriculturists had been met on many points, but there were still matters which would have to be considered in committee.

HOUSE OF COMMONS.

TUESDAY, JUNE 9TH.

Grants for Sanatoriums.

Mr. GODFREY LOCKER-LAMPSON asked the President of the Local Government Board whether, in a circular of April, 1913, certain figures were given to county councils on the subject of grants to be made by the Board to councils for the purpose of erecting sanatoriums; whether certain councils based their calculations on that circular; whether the Board had recently written stating that they must not be held as committing themselves to a grant, on the ground that it would be impossible to make grants at the rates referred to in the circular; and whether he proposed to take any action in the matter.—Mr. HERBERT SAMUEL replied: No circular was issued on this subject in April, 1913. The Local Government Board explained the basis on which grants were proposed to be made towards the cost of new sanatoria in a circular issued on May 14th, 1912, and in a further circular of Feb. 25th, 1913, they indicated that other considerations besides the population of the area would have to be taken into account in distributing the capital grant. I understand that some misconception has arisen in certain counties as to the amount of capital grant which is available in aid of the provision of hospital beds for the treatment of tuberculosis, but the maintenance grant of one-half the net cost of all schemes of treatment approved by the Board will make the total grants towards the cost of providing both sanatoria and hospitals for treating tuberculosis considerably larger than was contemplated in the circular of May 14th, 1912.

The Drug Fund.

Mr. LOCKER-LAMPSON asked the honourable Member for St. George's-in-the-East whether he was aware that a meeting was called in Lancashire recently, at the instance of the Pharmaceutical Society of Great Britain, in consequence of the deficiency in Insurance Committees' Drug Fund, which was increasing to a marked extent; and whether he could now make any announcement as to the payment of chemists' accounts.—Mr. WEDGWOOD BENN answered: The honourable Member is misinformed. The conference in question was convened to consider the most economical method of carrying out the necessary administrative work in connexion with the scrutiny of prescriptions.

Forcible Feeding of Suffragist Prisoners.

Mr. WEDGWOOD asked the Home Secretary on how many occasions and in what prisons the prison doctor had refused to feed forcibly a suffragist prisoner.—Mr. MCKENNA replied: There has been no such refusal by a prison doctor.

The Supply of Radium.

Mr. H. LAWSON asked the Secretary of State for Foreign Affairs whether any steps had been taken or were proposed to be taken by foreign Governments to limit or control the export of radium, with the object of reserving the home supplies in the first instance for the satisfaction of the home demand for radium for use in the treatment of disease.—Sir E. GREY answered: I understand that the Austrian Government in 1912 acquired the mines in the Joachimstal, from which the greater part of the world's supply of radium is said to be derived. In 1908 State control was established in Saxony over the search for and exploitation of minerals and water containing radium. I have no information as regards the steps taken by these or any other Governments to limit or control the export of radium, but I will make inquiries as to any regulations at present in force or in contemplation.

Sleeping Sickness Report.

Sir J. D. REES asked the Secretary of State for the Colonies what action would be taken on the Inter-departmental Committee's Report on Sleeping Sickness; and whether he had taken note of the Committee's finding that any such drastic measure as a general destruction of wild animals was not justified by the evidence.—Mr. L. HARCOURT replied: I am consulting the Governors of our colonies and protectorates in tropical Africa with regard to the recommendations of the Committee, and in the meantime I am not in a position to make a statement. I have noted the finding referred to.

WEDNESDAY, JUNE 10TH.

Chemists' Accounts.

Mr. G. LOCKER-LAMPSON asked the honourable Member for St. George's-in-the-East whether certain Scottish chemists had become so anxious about the payment in full of their accounts in respect of insured persons that they had threatened to discontinue the supply of medicines to insured persons unless satisfactory assurances were forthcoming; and whether the Scottish Commissioners had received representations to that effect.—Mr. WEDGWOOD BENN said in reply: The Scottish Insurance Commissioners have not received any such general representations as the honourable Member suggests. Two pharmaceutical committees have communicated with the Insurance Commissioners. The Scottish accounts for drugs will be dealt with in exactly the same manner as the drug accounts in other parts of the country.

Mr. LOCKER-LAMPSON asked the honourable gentleman what was the approximate proportion of insurance committees that had paid by way of advance less than 90 per cent. of the chemists' accounts for the quarter ending April, 1914.—Mr. WEDGWOOD BENN answered: The information for which the honourable Member asks could only be obtained by calling upon all the 193 insurance committees in Great Britain to prepare a special return.

Mr. CASSEL asked whether the honourable gentleman could give any assurance that the chemists would ultimately be paid their balance in full.—Mr. WEDGWOOD BENN replied that the chemists would be paid in accordance with the terms of the agreement which they had voluntarily entered into.

Mr. LOCKER-LAMPSON asked whether it was the case that the Birmingham Chemists' Committee had only a balance of £400 with which to pay a balance of £5000.—Mr. WEDGWOOD BENN answered that if the honourable Member would put a question on the notice paper the figures would be examined.

Mr. WORTHINGTON EVANS asked whether it was not the fact that in some cases the chemists had only received 17*s.* or 18*s.* in the £ for work done and drugs supplied.—Mr. WEDGWOOD BENN replied that he could not say in reply to a general question of this kind. Perhaps the honourable Member would put down in a question the case he had in mind.

Appointments.

Successful applicants for vacancies, Secretaries of Public Institutions and others possessing information suitable for this column, are invited to forward to THE LANCET *Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week, such information for gratuitous publication.*

ALLEN, JOHN, M.B., Ch.B.,Vict., D.P.H., has been appointed Clinical Tuberculosis Officer under the Insurance Act and Assistant Medical Officer at Bury.

BROWNLEE, JOHN, M.D., C.M. Glasg., has been appointed Medical Statistician under the Government Medical Research Committee.

BROWNLIE, WILLIAM BARRIE, F.R.C.S. Edin., M.B., Ch.B. Glasg., has been appointed Honorary Assistant Ophthalmic Surgeon to the Blackburn and East Lancashire Royal Infirmary.

RANSFORD, W. R., L.D.S. Eng., has been appointed Dental Surgeon to the Civil General Hospital, Rangoon.

RENSHAW, ARNOLD, M.B., B.S. Lond., has been appointed Bacteriologist to the Manchester Royal Eye Hospital.

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index).

ASHTON-UNDER-LYNE UNION WORKHOUSE.—Resident Medical Officer and Resident Assistant Medical Officer. Salaries £350 and £150 per annum respectively, with rations, laundry, and residence.

BARNET, CLARE HALL SANATORIUM, South Mimms.—Assistant Resident Medical Officer. Salary £120 per annum, with board, lodging, and laundry.

BARROW-IN-FURNESS, NORTH LONSDALE HOSPITAL.—House Surgeon. Salary £150 per annum, with residence, board, and laundry.

BEDFORD COUNTY HOSPITAL.—Assistant House Surgeon. Salary £80 per annum, with board, lodging, and laundry.

BELGRAVE HOSPITAL FOR CHILDREN, Clapham-road, S.W.—House Surgeon for six months. Salary at rate of £75 per annum, with board, residence, and washing.

BETHLEM ROYAL HOSPITAL, Lambeth-road, S.E.—Second Assistant Medical Officer, unmarried. Salary £200 per annum, with apartments, board, and laundry.

BIRKENHEAD BOROUGH HOSPITAL.—Senior House Surgeon. Salary £120 per annum, with board and laundry.

BIRMINGHAM AND MIDLAND HOSPITAL FOR SKIN AND URINARY DISEASES.—Clinical Assistant for afternoon attendance. Also Clinical Assistant to Electrical Department. Salary in each case at rate of 52 guineas per annum

BIRMINGHAM, CITY FEVER HOSPITAL, Little Bromwich.—Assistant Medical Officer. Salary £200 per annum, with board and residence.

BIRMINGHAM CITY HOSPITAL, Lodge-road.—Assistant Resident Medical Officer. Salary £200 per annum, with board, residence, &c.

BIRMINGHAM GENERAL DISPENSARY.—Resident Medical Officer, unmarried. Salary £240 per annum, with apartments, fire, lights, and attendance.

BIRMINGHAM GENERAL HOSPITAL.—Assistant Physician. Salary £50 per annum.

BIRMINGHAM, JAFFRAY BRANCH OF GENERAL HOSPITAL, Gravelly Hill.—Resident Medical and Surgical Officer. Salary £150 per annum, with board, residence, and washing.

BIRMINGHAM, SALTERLEY GRANGE SANATORIUM FOR CONSUMPTIVES, near Cheltenham.—Resident Medical Officer. Salary £300 per annum, with board, &c.

BIRMINGHAM UNION, DUDLEY-ROAD INFIRMARY.—Second Assistant Medical Officer and Fourth Assistant Medical Officer. Salary £160 and £140 per annum respectively, with apartments, rations, laundry, and attendance.

BOLTON INFIRMARY AND DISPENSARY.—Third House Surgeon. Salary £110 per annum, with apartments, board, and attendance.

BOOTLE BOROUGH HOSPITAL.—Senior and Junior House Surgeons. Salaries £120 and £100 respectively, with residence, board, and laundry.

BRADFORD ROYAL INFIRMARY.—House Surgeon, unmarried. Salary £100 per annum, with board, residence, and washing.

BRIGHTON, ROYAL ALEXANDRA HOSPITAL FOR SICK CHILDREN.—House Surgeon. Salary at rate of £100 per annum, with board, lodging, and washing.

BRISTOL EDUCATION COMMITTEE.—School Medical Officer. Salary £500 per annum.

BRISTOL ROYAL INFIRMARY.—House Surgeon for Throat, Nose, and Ear Department. Salary at rate of £100 per annum, with board, lodging, and laundry.

Burley-in-Wharfedale, West Riding Asylum, *Scalebor Park.*—Assistant Medical Officer. Salary £250 per annum, with board, residence, and laundry. Or *Locum Tenens to end of September.* Salary £5 5s. per week.

Burnley, Victoria Hospital.—House Surgeon. Salary £135 per annum, with residence, board, and washing.

Bury Infirmary.—Junior House Surgeon. Salary £150 per annum, with board, residence, and washing.

Bury St. Edmunds, West Suffolk General Hospital.—Resident Medical Officer, unmarried. Salary £120 per annum, with board, lodging, and laundry.

Canterbury, Kent and Canterbury Hospital.—House Surgeon and Junior House Surgeon, unmarried. Salaries £100 and £90 per annum respectively, with board, lodging, and washing. Also Honorary Surgeon.

Cardiff, King Edward VII.'s Hospital.—House Surgeon for the Ophthalmic and Ear, Nose and Throat Departments. Salary £100 per annum, with board, residence, and laundry. Also Two House Surgeons for six months. Salary at rate of £60 per annum, with board, residence, and laundry.

Chelsea Hospital for Women.—Anæsthetist. Salary £21 *per annum.*

Cheshire County Council.—Four District Tuberculosis Officers. Salaries £350 per annum.

Chesterfield and North Derbyshire Hospital.—Junior House Surgeon. Salary £90 per annum, with board, *apartments*, and laundry.

City of London Hospital for Diseases of the Chest, *Victoria Park, E.*—House Physician for six months. Salary at rate of £75 per annum, with board, *residence, and washing. Also* Clinical Assistant in Out-patient Department.

Clapham Maternity Hospital.—Assistant Medical Woman for Battersea District Maternity. Salary £50 per annum, with board *and residence.*

Colchester, Essex County Hospital.—House Surgeon. Salary £100 *per annum, with board*, washing, and *residence.*

Cumberland County Council.—Three Assistant County Medical Officers. Salary £350.

Darlington Hospital and Dispensary.—House Surgeon, unmarried. Salary £200 per annum, with board, lodging, and laundry.

Derby, Derbyshire Royal Infirmary.—House Physician and Assistant House Surgeon. Salaries £120 and £80 per annum respectively, with residence, board, and laundry.

Devonport, Royal Albert Hospital.—House Surgeon, unmarried. Salary £150 per annum, with board and laundry.

Dreadnought Hospital, Greenwich.—Assistant Surgeon.

Dundee Royal Infirmary.—House Surgeon. Also Out-door Maternity Assistant for three months. Salary each at rate of £40 per annum, with board, lodging, and laundry.

Durham County Sanatorium.—Medical Superintendent. Salary £400 per annum, with residence and personal board.

Epsom, London County Epileptic Colony.—Assistant Medical Officer. Salary £290 per annum, with board, lodging, and washing; if unmarried, or £90 a year in lieu if married and non-resident.

Evelina Hospital for Sick Children, Southwark, S.E.—House Surgeon and House Physician. Salary in each case at rate of £75 per annum, with board, residence, and washing. Also Surgeon to Out-patients. Also about Ten Clinical Assistants in Out-Patient Departments.

Great Northern Central Hospital, Holloway-road, N.—Anæsthetist. Salary 10 guineas per annum. Also Surgeon.

Halifax Royal Infirmary.—Second House Surgeon and Third House Surgeon, unmarried. Salary £120 and £100 per annum respectively, with residence, board, and washing.

Hammersmith Metropolitan Borough.—Medical Officer of Health. Salary at rate of £600 per annum.

Hampstead General and North-West London Hospital, Hampstead and Camden Town.—*Physician to Out-patients.*

Hertford County Hospital.—Resident House Surgeon, unmarried. Salary £100 per annum, with board, washing, and apartments.

Holborn Union.—Second Assistant Medical Officer at Infirmary, Archway-road, Upper Holloway, N. Salary £150 per annum, with board, apartments, and washing. Also Temporary Assistant Medical Officer at Infirmary, Cleveland-street, W. Salary at rate of £180 per annum, with residential allowances.

Hospital for Epilepsy and Paralysis and other Diseases of the Nervous System, Maida Vale, W.—Resident Medical Officer for six months. Salary at rate of £75 per annum, with board, lodging, and washing Also Assistant Physician.

Hospital for Sick Children, Great Ormond-street, London, W.C.—House Surgeons and House Physician, unmarried, for six months. Salary in each case £30, with board, residence &c.

Hospital for Women, Soho-square, W.—Resident Medical Officer for six months. Salary at rate of £80 per annum.

Huddersfield Royal Infirmary.—Assistant House Surgeon. Salary £80 per annum, with board, rooms, and washing.

Hull Royal Infirmary.—Casualty House Surgeon. Salary at rate of £80 per annum, with board and lodging.

Indian Medical Service.—Thirteen Commissions.

King Edward VII. Sanatorium, Midhurst, Sussex.—Second Assistant Medical Officer, unmarried. Salary £150 per annum, with board, lodging, and attendance.

King's Lynn, West Norfolk and King's Lynn Hospital.—House Surgeon. Salary £150 per annum.

Lahore Municipal Committee, Punjab, India.—Health Officer. Salary £600 per annum.

Leeds General Infirmary.—Resident Ophthalmic Officer. Salary £100 per annum, with board, residence, and laundry.

Leicester Royal Infirmary.—House Physician for six months. Salary at rate of £100 per annum, with board, apartments, and washing.

Liverpool, Highfield Infirmary, Knotty Ash, near Liverpool.—Assistant Medical Officer. Salary £160 per annum, with apartments, &c.

London Lock Hospital.—House Surgeon to Female Hospital, Harrow-road, W. Salary £100 per annum, with board, residence, and washing.

Macclesfield General Infirmary.—House Surgeon. Salary £150 per annum, with residence, board, and laundry.

Maidstone, Kent County Asylum.—Fourth Assistant Medical Officer, unmarried. Salary £250 per annum, with quarters, board, attendance, washing, &c.

Manchester, Ancoats Hospital, *Mill-street.*—Assistant House Surgeon. Salary £70 per annum, with board and residence.

Manchester, Hulme Dispensary, Dale-street, Stretford-road.—House Surgeon. Salary £180 per annum, with apartments, attendance, &c.

Manchester Northern Hospital for Women and Children, Park-place, Cheetham Hill-road.—*House Surgeon.* Salary £120 per annum, with apartments and board.

Manchester Royal Infirmary.—*Surgical Registrar.* Salary £75 per annum. Also Medical Officer for Out-patients and Accidents and Assistant Director in *Clinical Laboratory for six months.* Salary at rate of £100 per annum, with board and residence. Also Assistant Director in *Clinical Laboratory.* Salary £75 per annum.

Manchester, St. Mary's Hospitals for Women and Children.—*House Surgeon.* Salary at rate of £50 per annum, with board and residence.

Newcastle-upon-Tyne, University of Durham College of Medicine.—Demonstrator of Anatomy. Salary £200 per annum.

New Hospital for Women, Euston-road.—Female Obstetric Assistant for six months. Also Resident Medical Officer at House of Recovery, *New Barnet, for six months.* Salary £60. Also Two Clinical Assistants in Out-patient Department. Also Anæsthetist.

Northampton General Hospital.—Senior Resident Medical Officer, unmarried. Salary £140 per annum. Also Two House Surgeons, *unmarried.* Salary *£120* per annum each. Apartments, board, washing, attendance, &c., in each case.

Northamptonshire County Council Education Committee.—Assistant School Medical Officer. Salary £275 per annum.

Norwich, City of.—Assistant School Medical Officer and Assistant Medical Officer of Health. Salary £300 per annum.

Norwich, Jenny Lind Hospital for Sick Children.—Female Resident Medical Officer for six months. Salary £50 per annum, with board, apartments, and laundry.

Nottingham, Bagthorpe Institution and Infirmary.—Resident Assistant Medical Officer, unmarried, for six months. Salary at rate of £165 per annum, with apartments, &c.

Nottingham General Hospital.—Assistant House *Physician* for six months. Salary at rate of £100 per annum, with board, residence, and laundry.

Paddington Green Children's Hospital, London, W.—House Surgeon for six months. Salary at rate of *£80* per annum, with board, residence, and washing.

Plymouth, South Devon and East Cornwall Hospital.—House Physician for six months. Salary £90 per annum, with board, residence, and washing.

N.B.—A fee of 5s. is charged for the insertion of Notices of Births, Marriages, and Deaths.

Notes, Short Comments, and Answers to Correspondents.

ROGER BACON.

THE seventh centenary of the birth of Roger Bacon was celebrated this week at Oxford. The "Admirable Doctor" was born at Ilchester in Somerset in 1214. Although he studied at Oxford he was ordered to Paris, but his too great proficiency in natural science exposed him there to severe treatment. His Opus Majus cost him an enormous amount of money to write. His part in discoveries in astronomy, chemistry, physics, geometry, mechanics, and optics is now better understood, although his own generation appears to have treated him largely as a wizard or pretender. Posterity seems to be quite willing to pay compensation for the persecutions which the famous Franciscan friar suffered from his contemporaries. The introduction to the Opus Majus by Dr. Bridges shows us that he was a famous forerunner of modern thought.

INCOME-TAX CLAIMS.

To the Editor of THE LANCET.

SIR,—Every year since the earned rate has been in force large numbers of taxpayers have been required to pay income-tax at the unearned or higher rate for the simple reason that they have neglected to make the return for assessment to income-tax which is now due to be made. In the case of persons whose incomes do not exceed £1000 the earned rate is 9*d.* in the £, but if they neglect to make a return and to claim the *earned* rate before Sept. 30th they will be charged at a higher rate, and the tax payable may be nearly double. Let your readers make their returns at once; the difference is worth saving.

I am, Sir, yours faithfully,
E. MONTAGUE,
Secretary, the Income-tax Adjustment Agency, Limited,
9/11, Poultry, London, E.C., June 8th, 1914.

LUXOR AS A HEALTH RESORT.

Dr. W. E. Nickolls Dunn and Dr. G. Vigers Worthington, superintendent medical officers to the Luxor Hospital for natives, have just issued the second edition of their little handbook to Luxor, which gives in small compass, and illustrated with good photographs and a sketch map, an account of this pleasant winter resort in Upper Egypt. Medical men thinking of sending patients to this part of Africa will find in it useful hints on the selection of cases, climatic conditions, and other matters. It is published by H. K. Lewis at 1*s.* 6*d.* net.

M. B. A.—(1) An account of Binet's method of testing mental development in children will be found in La Mesure du Développement de l'Intelligence chez les Jeunes Enfants. Bulletin de la Société Libre pour l'Étude Psychologique de l'Enfant. Paris: F. Alcan. Price Fr.1.50. Our correspondent is also referred to "Feeble-mindedness and the Measurement of the Intelligence by the Method of Binet and Simon," by Dr. W. C. Sullivan, in THE LANCET, March 23rd, 1912, p. 777, and annotation with the same title in the same issue, p. 810. (2) The Second International Congress on School Hygiene took place in the University of London from August 5th to 10th, 1907, under the presidency of Sir Lauder Brunton, Bart. The preceding congress was held at Nuremberg in 1904 under the presidency of H.R.H. Prince Louis Ferdinand of Bavaria. The third congress took place in Paris in 1910 under the patronage of the French Minister of Public Instruction. The fourth congress took place at Buffalo, New York, U.S.A., from August 25th to 30th, 1913

A. B. (*Wellingborough*) has omitted to enclose his name and full address.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

A DIARY OF CONGRESSES.

WE shall publish this diary from time to time that our readers may have under their hands the dates of the approaching scientific Congresses. It is unnecessary to issue the lists of all these functions week by week, and we propose to make only such gatherings as will occur in the immediate future the subject of regular announcement. The following Congresses, Conferences, and Exhibitions are announced:—

May 1st–Nov. 1st (Lyons).—International Town Hygiene Exhibition.
„ 15th–Oct. 15th (Berne).—Swiss National Exhibition.
May–October (London, Shepherd's Bush).—Anglo-American Exposition.
June 15th (The Hague).—Third International Opium Convention.

June 15th–18th (*Portsmouth*).—*International Abolitionist Conference (Prostitution).*

" 18th–20th (Newcastle-upon-Tyne).—Fifth Annual Conference of the British Hospitals Association.

" 18th–24th (London, Church House, Westminster).—International Conference on the Blind.

" 22nd–26th (Atlantic City, N.J.).—American Medical Association.

June–July (Groningen).—University of Groningen 300th Anniversary Celebration.

July 2nd and 3rd (Liverpool).—National Conference on Infant Mortality.

" 6th–11th (Blackpool).—Twenty-ninth Congress of the Royal Sanitary Institute.

" 7th and 8th (Leeds).—Sixth Annual Conference of the National Association for the Prevention of Consumption, &c.

" *7th–10th (St. John, N.B.).—Canadian Medical Association.*

" 8th–10th (Oxford).—Ophthalmological Congress.

" 15th–20th (Edinburgh).—Congress of the Royal Institute of Public Health.

Medical Diary for the ensuing Week.

SOCIETIES.

ROYAL SOCIETY, *Burlington House, London, W.*

THURSDAY.—Surgeon-General Sir D. Bruce, Major A. E. Hamerton, Captain D. P. Watson, and Lady Bruce: (1) Trypanosome Diseases of Domestic Animals in Nyasaland. Trypanooma Caprae (Kleine)—Part III., Development in Glossina Morsitans. (2) Trypanosomes found in Wild Glossina Morsitans and Wild Game in the "Fly-belt" of the Upper Shiré Valley. Marshall: On the Relation Between the Thymus and the Generative Organs, and on the Influence of these Organs upon Growth. With a Note by Mr. G. U. Yule (communicated by Prof. J. N. Langley).—Mr. H. E. Roaf: The Vapour Pressure Hypothesis of Contraction of Striated Muscle (communicated by Prof. C. S. Sherrington).—Mr. A. N. Drury: The Validity of the Microchemical Test for the Oxygen Place in Tissues (communicated by Mr. W. B. Hardy).—Prof. J. S. Macdonald: Man's Mechanical Efficiency (communicated by Prof. C. S. Sherrington).—Dr. A. Holt: The Colouring Matters in the Compound Ascidian Diazona Violacea, Savigny (communicated by Prof. W. A. Herdman).

ROYAL SOCIETY OF MEDICINE, 1, Wimpole-street, W.

TUESDAY.

GENERAL MEETING OF FELLOWS at 5 P.M.

Ballot for Candidates for Fellowship.

THURSDAY.

SECTION OF DERMATOLOGY (Hon. Secretaries—J. M. H. MacLeod, S. E. Dore): at 4.30 P.M.

Cases:

Dr. Graham Little: (1) Pellagra with Skin Symptoms; (2) Trophoedema; (3) *Favus in a Mouse.*

Dr. Pernet: (1) Two Cases of Favus; (2) Bullous Ichthyosis.

Dr. Bunch: *Paget's Disease of the Nipple.*

Dr. Knowsley Sibley: (1) Urticaria Pigmentosa; (2) Adenoma Sebaceum.

Dr. I. J. Davies: Two Cases of Erythema Due to Carbon Monoxide Poisoning.

UNITED SERVICES MEDICAL SOCIETY, Royal Army Medical College, Grosvenor-road, S.W.

MONDAY.—4 P.M., Annual General Meeting.

LONDON DERMATOLOGICAL SOCIETY, St. John's Hospital, 49, Leicester-square, W.C.

TUESDAY.—4.30 P.M., Annual Meeting. *Clinical Meeting.* Cases will be shown by Dr. Dockrell, Dr. Bunch, Dr. Sibley, Dr. Griffith, Dr. Phibbs, and Dr. Gooding. 5.15 P.M., Discussion on Some Points in the Treatment of Syphilis (opened by Mr. C. H. Mills).

ROYAL METEOROLOGICAL SOCIETY, 70, Victoria-street, Westminster, S.W.

WEDNESDAY.—4.30 P.M., Papers:—Mr. B. C. Wallis: The Rainfall of the Southern Pennines.—Mr. H. J. Bartlett: The Relation between Wind Direction and Rainfall.

MEDICAL SOCIETY OF LONDON, 11, Chandos-street, Cavendish-square, W.

THURSDAY.—9 P.M., Lettsomian Lectures:—Dr. F. M. Sandwith: Dysentery. (Lecture III., *illustrated by pictures and pathological specimens.*)

WEST LONDON MEDICO-CHIRURGICAL SOCIETY, Kensington Town Hall.

FRIDAY.—8.15 P.M., Cavendish Lecture:—Dr. F. W. Mott: The Causes of Insanity. Followed by Annual Conversazione.

SOCIETY OF TROPICAL MEDICINE AND HYGIENE, 11, Chandos-street, Cavendish-square, W.

FRIDAY.—8.30 P.M., Paper:—Major S. P. James, I.M.S.: Mosquito Work in Ceylon.

LECTURES, ADDRESSES, DEMONSTRATIONS, &c.

ROYAL COLLEGE OF PHYSICIANS OF LONDON, Pall Mall East.

THURSDAY.—5 P.M., Croonian Lecture:—Dr. E. Goodall: On Some Modern Aspects of Certain Problems in the Pathology of Mental Diseases.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC, 22, Chenies-street, W.C.

MONDAY.—4 P.M., Dr. G. N. Meachen: Clinique (Skin). 5.15 P.M., Lecture:—Dr. O. Grünbaum: Modern Methods of Examination of the Stomach.

TUESDAY.—4 P.M., Dr. J. Parkinson: Clinique (Medical). 5.15 P.M., Lecture:—Dr. D. Forsyth: The Diagnosis of Intracranial Tumours.

WEDNESDAY.—4 P.M., Mr. G. E. Waugh: Clinique (Surgical). 5.15 P.M., Lecture:—Mr. L. B. *Rawling: Decompression of the Brain in* Relation to Injury and Disease (lantern demonstration).

THURSDAY.—4 P.M., Mr. C. W. *Rowntree: Clinique* (Surgical). 5.15 P.M., Lecture:—Dr. F. G. Crookshank: Croup.

FRIDAY.—4 P.M., Mr. R. R. *James: Clinique* (Eye).

POST-GRADUATE COLLEGE, West London Hospital, Hammersmith-road, W.

MONDAY.—10 A.M., Dr. Simson: Diseases of Women. 10.30 A.M., Medical Registrar: Demonstration of Cases in Wards. 12 noon, Dr. Bernstein: Pathological Demonstration. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. D. Armour: Operations. Dr. Pritchard: Bacterial Therapy Department. Mr. B. Harman and Mr. Gibb: Eye Department. 5 P.M., Lecture:—Dr. Pernet: Congenital Syphilis.

TUESDAY.—10 A.M., Dr. Robinson: Gynæcological Operations. Dr. Owen: Demonstration of Cases in Wards. 12 noon, Mr. T. Gray: Demonstration of Fractures, &c. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Baldwin: Operations. Dr. Davis: Diseases of the Throat, Nose, and Ear. Dr. Pernet: Diseases of the Skin. 5 P.M., *Lecture:—Dr. Pernet: Lupus* Vulgaris.

WEDNESDAY.—10 A.M., Dr. Saunders: Diseases of Children. Dr. Davis: Operations of the Throat, Nose, and Ear. 11 A.M., Mr. Souttar: Demonstration of *Minor Operations.* 12 noon, Lecture:—Mr. Souttar: Abdominal Diagnosis. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Pardoe: Operations. Dr. Simson: Diseases of Women. Mr. Gibb: Diseases of the Eye. 5 P.M., Lecture:—Dr. Pernet: Lupus Erythematosus.

THURSDAY.—9 A.M., Dr. Bernstein: Bacterial Therapy Department. 10 A.M., Dr. Simson: Gynæcological Demonstration. 12 noon, Lecture:—Dr. G. Stewart: Neurological Cases. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. D. Armour: Operations. Mr. B. Harman: Diseases of the Eye. 5 P.M., Lecture:—Mr. Ll. Williams: Dental Disease in Children and its Treatment.

FRIDAY.—10 A.M., *Dr. Robinson: Gynæcological* Operations. 10.30 A.M., Surgical Registrar: Demonstration of Cases in Wards. 12.15 P.M., Lecture:—Dr. Bernstein: Applied Pathology. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Baldwin: Operations. *Dr. Davis: Diseases of the* Throat, Nose, and Ear. Dr. Pernet: Diseases of the Skin. 5 P.M., Lecture:—Dr. Pernet: Psoriasis.

SATURDAY.—10 A.M., Dr. Saunders: Diseases of Children. Dr. Davis: Operations of the Throat, Nose, and Ear. *Mr. B. Harman: Operations of the Eye.* 12 noon, Lecture:—Mr. Souttar: Surgical Anatomy of the Abdomen. 2 P.M., Medical and Surgical *Clinics. X Rays. Mr. Pardoe: Operations.*

LONDON SCHOOL OF CLINICAL MEDICINE, Dreadnought Hospital, Greenwich.

MONDAY.—Out-patient Demonstrations:—10 A.M. Dr. H. B. Carlill: Medical. Mr. H. Curtis: Surgical. 12 noon, Mr. G. N. Biggs: Throat, Nose, and Ear.——2.15 P.M., Mr. W. Turner: Surgery. 3 P.M., Mr. W. Turner: Operations. 3.15 P.M., Sir Dyce Duckworth: Medicine. 4.15 P.M., Mr. R. Lake: Throat, Nose, and Ear.

TUESDAY.—Out-patient Demonstrations:—10 A.M., Dr. C. B. Zundel: Medical. Mr. Cole: Surgical. 12 noon, *Dr. H. MacCormac*: Skin.——2 P.M., Mr. L. McGavin: Operations. 2.15 P.M., Mr. R. Carling: Surgery. 3.15 P.M., Dr. G. Rankin: Medicine. 4.15 P.M., Sir Malcolm Morris: Skin. 4.30 P.M., Special Lecture:—Mr. I. Back: Hæmorrhoids.

WEDNESDAY.—Out-patient Demonstrations: 10 A.M., Dr. H. B. Carlill: Medical. *Mr. Cecil Rowntree: Surgical.* 11 A.M., Mr. R. R. Bickerton: Eye.——2 P.M., Mr. L. V. Cargill or Mr. Choyce: Operations. 2.15 P.M., Dr. F. Taylor: Medicine. 3.15 P.M., Mr. C. C. Choyce: Mr. Cargill: Eye Clinique. 4.30 P.M., Surgery.

THURSDAY.—Out-patient Demonstrations:—10 A.M., Dr. H. R. Prentice: Medical. Mr. H. Curtis: Surgical. 12 noon, Mr. G. N. Biggs: Throat, Nose, and Ear.——2 P.M., Mr. R. Carling or Mr. W. Turner: Operations. *Dr. A. Davies:* Pathological *Demonstration.* 3.15 P.M., Dr. R. Wells: Medicine. *4.30 P.M.*, Special Lecture:—Mr. H. Curtis: *Modern Operations for the Radical* Cure of Carcinoma of the Face and Lips.

FRIDAY.—Out-patient *Demonstrations:*—10 A.M., Dr. C. B. Zundel: Medical. Mr. Cole: Surgical. 12 noon, Dr. H. MacCormac: Skin.——2 P.M., Mr. L. McGavin: *Operations.* 2.15 P.M., Sir John Rose Bradford: Medicine. 3.15 P.M., Mr. L. McGavin: Surgery.

SATURDAY.—Out-patient *Demonstrations:* 10 A.M., Dr. H. R. Prentice: Medical. Mr. Cecil Rowntree: Surgical. 11 A.M. Mr. R. R. Bickerton: Eye.——10 A.M., Col. Barry: Radiography.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.

MONDAY.—Clinics:—10.30 A.M., Surgical Out-patient (Mr. E. Gillespie). 2.30 P.M., Medical Out-patient (Dr. T. R. Whipham); Gynæcological (Dr. Banister). 3 P.M., Medical In-patients (Dr. R. M. Leslie).

TUESDAY.—2.30 P.M., Operations. Clinics:—Medical Out-patient (Dr. A. G. Auld); Surgical (Mr. Howell Evans); Nose, Throat, and Ear (Mr. H. D. Gillies). X Ray and Electrical Methods (Dr. Metcalfe). 3.30 P.M., *Medical* In-patient (Dr. A. J. Whiting).

WEDNESDAY.—Clinics:—2 P.M., *Throat* Operations (Mr. Gillies). 2.30 P.M., Children's Out-patient (Dr. T. R. Whipham); Skin (Dr. G. N. Meachen); Eye (Mr. Dorell).

THURSDAY.—2.30 P.M., Gynæcological Operations (Dr. A. E. Giles). Clinics:—Medical Out-patient (Dr. A. J. Whiting); Surgical (Mr. Carson); X Rays and Electrical Methods (Dr. Metcalfe).

FRIDAY.—2.30 P.M., Operations. Clinics:—Medical Out-patient (Dr. A. G. Auld); Surgical (Mr. E. Gillespie); Eye (Mr. R. P. Brooks). 3 P.M., Medical In-patient (Dr. G. P. Chappel).

UNIVERSITY COLLEGE HOSPITAL MEDICAL SCHOOL (UNIVERSITY OF LONDON), University-street, Gower-street, W.C.
MONDAY.—5 P.M., Sydney Ringer Memorial Lecture:—Dr. T. R. Elliott: The Adrenal Glands.

ROYAL HOSPITAL FOR DISEASES OF THE CHEST, Medical School, City-road, E.C.
MONDAY.—1.30 P.M., Department for the Prevention of Consumption. 2 P.M., Cardiac Department, Dr. Stott; Out-patient Department, Dr. Phear, Dr. S. Thompson. 3 P.M., Wards, Dr. Phear.
TUESDAY.—9 A.M., Laryngological Department, Mr. Mant. 1.30 P.M., Department for the Prevention of Consumption. 2 P.M., Out-patient Department, Dr. M. Leslie, Dr. B. King; Operations, Mr. A. Evans. 3 P.M., Wards, Dr. White. 4 P.M., Wards, Dr. M. Leslie.
WEDNESDAY.—2 P.M., Wards, Dr. A. Davies; Out-patient Department, Dr. Drysdale, Dr. Kellie. 4 P.M., Wards, Dr. Drysdale. 4.30 P.M., Roentgen Ray Department, Dr. Jordan.
THURSDAY.—9.30 A.M., Dental Department, Mr. G. Thomson. 10 A.M., Cardiac Department, Dr. Stott. 1.30 P.M., Department for the Prevention of Consumption. 2 P.M., Out-patient Department, Dr. Phear, Dr. S. Thompson. 4.30 P.M. Laryngological Department, Mr. Mant.
FRIDAY.—1.30 P.M., Department for the Prevention of Consumption. 2 P.M., Wards, Dr. Calvert; Out-patient Department, Dr. M. Leslie, Dr. B. King. 5 P.M., Lecture-Demonstration:—Dr. S. Thompson: Clinical Demonstration on Pulmonary Osteo-Arthropathy (illustrated by the epidiascope).
SATURDAY.—10 A.M., Out-patient Department, Dr. Drysdale, Dr. Kellie. 11.30 A.M., Roentgen Ray Department, Dr. Jordan.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton, S.W.
MONDAY.—Excursion to Frimley, leaving Waterloo at 1.5 P.M., conducted by Dr. Wethered.

CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, Victoria Park, E.
Course of Demonstrations for Post-Graduates:—
TUESDAY.—4 P.M., Dr. W. J. Hadley: The Prognosis of Heart Disease.
FRIDAY.—4 P.M., Mr. M. Davies: Review of Thoracic Surgery.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen-square, Bloomsbury, W.C.
TUESDAY.—3.30 P.M., Clinical Lecture:—Dr. F. Batten: Cerebellar Disease.
FRIDAY.—3.30 P.M., Clinical Lecture:—Dr. P. Saunders: Use of Electrical Currents.

THE THROAT HOSPITAL, Golden-square, W.
MONDAY.—5.15 P.M., Special Demonstration of Selected Cases.
THURSDAY.—5.15 P.M., Clinical Lecture.

LONDON LOCK HOSPITAL, 91, Dean-street, Soho, W.
Special Course of Instruction in Venereal Diseases, for Post-Graduates and Students, with Practical Demonstrations of the Various Methods of Treatment:—
MONDAY.—Clinics:—1 P.M., Mr. Ryall; 6 P.M., Mr. Gibbs. 2 P.M., Lecture:—Mr. Ryall: Tertiary Lesions of the Tongue
TUESDAY.—Clinics:—2 P.M., Mr. Lane; 6 P.M., Mr. Paterson.
WEDNESDAY.—Clinic:—6 P.M., Mr. Shillitoe.
SATURDAY.—Clinic:—2 P.M., Mr. McDonagh.

MANCHESTER HOSPITALS POST-GRADUATE CLINICS.
TUESDAY.—MANCHESTER AND SALFORD HOSPITAL FOR SKIN DISEASES, Quay-street.—4.30 P.M., Mr. Savatard: Syphilis of the Skin.

ROTUNDA HOSPITAL POST-GRADUATE COURSES, Dublin.
MONDAY.—10 A.M., Obstetrical Lecture: Cæsarean Section and its Modifications. 11 A.M., Examination of Patients and Minor Operations.
TUESDAY.—10 A.M., Major Operations.
WEDNESDAY.—10 A.M., Obstetrical Lecture: Pubiotomy and Symphysiotomy. 11 A.M., Examination of Patients and Minor Operations.
THURSDAY.—10 A.M., Major Operations.
FRIDAY.—10 A.M., Gynæcological Lecture: Tumours of the Ovary and their Complications. 11 A.M., Examination of Patients and Minor Operations.

For further particulars of the above Lectures, &c., see Advertisement Pages.

EDITORIAL NOTICES.

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITOR," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention should be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this office.

Lectures, original articles, and reports should be written on one side of the paper only, AND WHEN ACCOMPANIED BY BLOCKS IT IS REQUESTED THAT THE NAME OF THE AUTHOR, AND IF POSSIBLE OF THE ARTICLE, SHOULD BE WRITTEN ON THE BLOCKS TO FACILITATE IDENTIFICATION

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers—not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale, and advertising departments of THE LANCET *should be addressed "To the Manager."*

We cannot undertake to return MSS. not used.

MANAGER'S NOTICES.

TO SUBSCRIBERS.

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423, Strand, London, W.C., are dealt with by them? Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and *not* to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will ensure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

THE COLONIAL AND FOREIGN EDITION (printed on thin paper) is published in time to catch the weekly Friday mails to all parts of the world.

The rates of subscriptions, post free from THE LANCET Offices, have been reduced, and are now as follows:—

FOR THE UNITED KINGDOM.		TO THE COLONIES AND ABROAD.	
One Year	£1 1 0	One Year	£1 5 0
Six Months	0 12 6	Six Months	0 14 0
Three Months	0 6 6	Three Months	0 7 0

(The rate for the United Kingdom will apply also to Medical Subordinates in India whose rates of pay, including allowances, is less than Rs.50 per month.)

Subscriptions (which may commence at any time) are payable in advance. Cheques and Post Office Orders (crossed "London County and Westminster Bank, Covent Garden Branch") should be made payable to the Manager, Mr. CHARLES GOOD, THE LANCET Offices, 423, Strand, London, W.C.

TO COLONIAL AND FOREIGN SUBSCRIBERS.

SUBSCRIBERS ABROAD ARE PARTICULARLY REQUESTED TO NOTE THE RATES OF SUBSCRIPTIONS GIVEN ABOVE.

The Manager will be pleased to forward copies direct from the Offices to places abroad at the above rates, whatever be the weight of any of the copies so supplied.

SOLE AGENTS FOR AMERICA—MESSRS. WILLIAM WOOD AND CO., 51, Fifth Avenue, New York, U.S.A.

METEOROLOGICAL READINGS.

ABSTRACTS OF

The Milroy Lectures

ON THE

HYGIENIC ASPECT OF THE COAL-MINING INDUSTRY IN THE UNITED KINGDOM.

Delivered before the Royal College of Physicians of London

By FRANK SHUFFLEBOTHAM, M.A., M.D. CANTAB., J.P.,

MEDICAL REFEREE UNDER THE WORKMEN'S COMPENSATION ACT FOR THE NORTH STAFFORDSHIRE DISTRICT.

LECTURE IV.[1]

MINERS' NYSTAGMUS.

MR. PRESIDENT AND GENTLEMEN,—Miners' nystagmus must be regarded as the commonest of all occupational diseases. This disease was first recognised by Gillett, of Sheffield, about 1854, although no case was mentioned in medical literature until 1861, when the symptoms were first described by De Conde. In 1907 it was felt necessary to schedule miners' nystagmus as an occupational disease under the Workmen's Compensation Act, in order to entitle sufferers to compensation when disabled by it. Dr. J. Court has stated as a result of examination of several thousands of workmen that 35 per cent. of coal getters are subject to this disease to some extent.

Symptoms of nystagmus are most commonly found among miners engaged in holing, a process which consists of cutting the coal seam so as to get out the coal in pieces as large as possible, the holer being on his side with his knees drawn up and his head thrown backwards, and he strikes the coal with a horizontal swing, the lamp being placed near his feet. He may undercut the seam or "top cut" it, but in either case the muscles of the eyeballs are in a continually strained position, and as a result the elevator muscles suffer from strain and cramp. The hewers and the loaders who are working at the face come next in liability to the disease. All observers agree that the workmen who work hardest and who earn the best wages are more likely to be affected than those whose weekly output of coal is smaller.

Miners' nystagmus seldom occurs before the age of 25, and not usually before a miner has worked for ten years underground.

McMurray found that of 120 consecutive cases of miners' nystagmus, 39, or practically one-third, were between 40 and 50 years of age, and 33 between 30 and 40. Between 50 and 60 there were 22 cases. There were two patients under the age of 20, one of whom was suffering from congenital nystagmus, and the symptoms in the second case came on after a severe injury to the head; between the ages of 60 and 70 he had six cases.

Libert, in an analysis of 262 cases, found that 37 per cent. occurred between the ages of 30 and 40, and 31 per cent. between the ages of 40 and 50; 22 per cent. occurred between 20 and 30.

Llewellyn analysed 600 cases, and found that 33 per cent. occurred between the ages of 30 and 40, 29 per cent. between 40 and 50, and 16 per cent. between 20 and 30. The same observer recorded that only 7 per cent. of his cases had worked underground less than ten years, while 33 per cent. had worked between 20 and 30 years.

It would seem that the longer a man has worked in the pit the more likely is he to develop nystagmus. This may be regarded as a general rule which may be applied to all workers up to the time when they have worked 30 years in the pit, after which they do not appear to be so susceptible. The youngest case that has come under Llewellyn's notice was a boy aged 15, and 47 of his cases developed the disease before the age of 25. In McMurray's series of 120 cases 9 of the patients were 25 years and under. The shortest time in which the disease has been known to develop after underground work is five months.

Symptoms.

We must realise at the outset that we are not dealing with a disease localised to the eyes, but with a general disease, one symptom of which is oscillation of the eyeballs. The term "miners' nystagmus" is an unfortunate one, as it simply relates to one symptom, and the nomenclature of this disease has certainly given rise to a great deal of confusion, even among medical men who practise in colliery districts, and who are constantly coming in contact with patients suffering from it. Nystagmus is a symptom which is common to a large number of diseases, among which may be mentioned Friedreich's ataxia, disseminated sclerosis, and some congenital diseases of the eye, and the term was first used by physicians who noticed symptoms of nystagmus commonly associated with children who had nodding heads, hence the derivation of the word from νυστάζω, meaning "I nod." The symptoms of this disease, however, are not confined to oscillation of the eyeballs and any effects which may result from this phenomenon. There may be, and generally are, symptoms such as headache, nausea, attacks of giddiness, muscular tremors, twitching of the muscles in different parts of the body, especially the muscles of the eyelids and the face and neck; neurasthenia may be a prominent symptom, with its associated conditions, such as a quickened pulse, exaggerated reflexes, increased vasomotor irritability, sleeplessness, and nervous depression. All these symptoms may be present in any given case of miners' nystagmus, but in many cases some only of the symptoms are present, and at given times the prominent symptom, the oscillation of the eyeballs, may actually be absent, although the patient is undoubtedly suffering from the disease which we know as miners' nystagmus.

The commonest complaint associated with miners' nystagmus is the jumping about or flickering of the lights in the pit or the gas lights on the surface. Those who know what a St. Catharine's wheel is generally compare the sensation to the lights moving round like those wheels. Photophobia is a common symptom of miners' nystagmus, and a large majority of the cases complain that they cannot see at night, and others that the symptoms are worse at twilight. The symptom of night blindness is one of the earliest to be perceived by the sufferer. This is undoubtedly one of the most characteristic symptoms of miners' nystagmus, and it is regarded by Court and Llewellyn as being present in about 75 per cent. of all cases. Among the rarer subjective symptoms are double vision and photopsia. Patients suffering from miners' nystagmus very often complain of nervousness, sleeplessness, and of mental depression. There may be a general facial expression which is common to the neurasthenic, and the patient may also complain of vague shifting aches and pains in different parts of the body. In some cases mental symptoms of a very serious nature occur, and the nervous depression is so great occasionally that the patients have suicidal tendencies.

---

[1] Abstracts of the previous lectures were published in THE LANCET of June 20th (p. 1731) and 27th (p. 1795), 1914.

Physical Signs.

The most prominent and the most important physical sign is oscillation of the eyeballs. In a typical case the movement of the eyeball is rotatory, rhythmic, and involuntary, but may vary in different patients in direction of movement as well as in frequency; in exceptional cases to-and-fro movements are found as well. All observers are agreed that vertical nystagmus is very rare. While the disease usually affects both eyes, unilateral nystagmus has been observed. I have seen nystagmic movements of the muscular stump after the eye has been removed, and rhythmic oscillations of a shrunken and blind eye. The movements may be different in direction in each eye, and the rate may vary in different patients and in the same patient at different times. In the majority of cases both eyes move at the same rate.

The frequency in ordinary cases is from 100 to 300 oscillations per minute, but occasionally the movements are so rapid that it is impossible to count them. The range of movement varies from 1 millimetre to 1 centimetre, and sometimes the movements are so rapid and the excursion so short that it is impossible to detect the oscillation of the eyeball without the use of an ophthalmoscope. Llewellyn has pointed out that the fine rapid movements are much more constant in rhythm than the coarser movements, which are slower and more irregular. The oscillations are increased by exertion, by excitement, by looking upwards, by rapid movements of the head, by bending the head and raising it quickly, or during the fixation of some distant object; and in cases in which no oscillations are obvious at first on medical examination they may be induced by the same means. Where the miner has been absent from work for a considerable time this procedure may not be sufficient to induce the oscillations, and they can only be made evident by placing the miner in a position similar to that in which he works in the mine, and by asking him to go through the same movements of his arms in a darkened room as he would perform in the pit while at work. The oscillations may be arrested by looking down and resting the eyes, and entirely stopped on strong convergence of the eyes, and they cease during sleep.

Clonic spasm of the eyelids is a common, and in some cases the main prominent, objective symptom. Sometimes it is an early, sometimes a late symptom, and very often it may remain after the oscillation of the eyeball has ceased. Llewellyn has pointed out that the movements of the eyelids associated with nystagmus are of two kinds—the coarse blinking movement and the fine tremor or clonic spasm; and in the former, although the movements may be quick, they are tonic and not clonic. These movements may be exaggerated and made more obvious by adopting the means I have described in discussing oscillation of the eyeballs. The frequency of the clonic spasm and the oscillation of the eyeballs are independent of each other.

In addition to the above two signs we may often find tremors of the facial muscles, of the eyebrows and even of the whole head. Llewellyn found tremor of the head in 27 per cent. of his cases, McMurray found it after exertion to be an almost invariable symptom, and my own experience coincides with that of the latter observer. The muscles of the neck and shoulder may also be affected, and in some cases the spasm of the muscles of the neck may be so pronounced that the head is held backwards and wry-neck produced.

The gait in a typical case of miners' nystagmus is characteristic. The patient endeavours to compensate for his visual defect by throwing the head backwards and keeping the eyes down and walking stiffly. In severe cases the gait may be ataxic and Romberg's sign may be observed.

Vision.

Many observers are of the opinion that some optic defect is one of the principal factors in the production of miners' nystagmus. We may find evidence of old injury to the eye, but a large percentage of cases show errors of refraction. Brown and Mackenzie found such errors present in 90 per cent., astigmatism accounting for 48 per cent., hypermetropia for 27 per cent., and myopia for 15 per cent. From McMurray's series of cases of miners' nystagmus it appears that two-thirds of them have some refractive error, and Folker found 75 per cent. and Llewellyn 83 per cent. in the cases which have come under their observation. Astigmatism of various kinds is the commonest form of refractive error, and hypermetropic cases are more frequent than myopic ones.

Visual acuity is nearly always diminished, even in convalescent cases where there is no oscillation of the eyeballs. Cridland has investigated the field of vision in a series of cases of miners' nystagmus, in nearly all of which the men had been compelled to give up their work on account of the severity of the symptoms. The result of his examination of these cases showed:—

1. That contraction existed for blue, white, and red in practically all the cases examined. 2. The contraction was of the concentric type and symmetrical in shape, although not always in depth. 3. In the majority of cases the colours were in their correct order, but occasionally interlacing of the red and blue occurred, the correct order being recovered as the case improved. 4. The contractions for red and blue were generally greater than those for white, and rather greater for red than blue. 5. By grouping the cases into mild, moderate, and severe types the fields broadly showed corresponding contractions. 6. Speaking generally, as the disease improved the fields of vision improved, but contraction persisted as long as any subjective symptoms were present, and although oscillatory movements could not be elicited by any test. 7. Most of the cases showed more or less marked signs of such symptoms as clonic spasm of the eyelid, twitching of the neck, &c., but there seems to be no direct relationship between the presence and degree of these signs.

Cridland points out that there is a great similarity between the fields in miners' nystagmus and in traumatic neurasthenia, and throws out the suggestion that the alteration in the field of vision in nystagmus cases is of the same nature as that found in traumatic neurasthenia. If we keep in mind the possibility of miners' nystagmus being a neurosis of the same nature as neurasthenia, and that neurasthenia and miners' nystagmus are so often associated in the same subject, and that each may be induced by an injury in many cases, I think we may infer that nystagmus itself should be regarded as a local symptom of neurasthenia.

I have noticed in many cases of miners' nystagmus that when the patient is sitting down and has put his head between his legs for a short time, say a minute or so, on raising his head the eyes not only have the oscillations and clonic spasm, the oscillations being more marked, but there has been a prominent bulging of the eyes, almost bordering on exophthalmos, accompanied by marked injection. I have found this symptom sometimes of the greatest value in doubtful cases.

Onset of the Disease.

In some cases the onset is gradual, and on the average we may say that 12 months may elapse between the appearance of the first symptoms and the time when the patient consults his doctor. On the other hand, in some cases the onset is strikingly sudden, and when it is so it is generally the result of some debilitating illness, such as influenza, or the result of an accident either to the eye or to other parts of the body. The disease may develop in a few months after a miner has worked regularly for 20 or 30 years in the mine without any apparent trouble. When the patient first consults his doctor he may be unconscious of the oscillation of the eyeballs, and he may have no suspicion that he is suffering from miners' nystagmus. He may complain of some of the objective symptoms already described. In another group of cases we may find that the symptoms complained of are purely nervous; the man may tell his doctor that he is simply run down or fearing a nervous breakdown, and symptoms of neurasthenia preponderate to such an extent that miners' nystagmus may be overlooked.

The progress of the disease may depend upon many conditions. Just as illness or an accident may be the cause of the sudden onset of the disease, we find that they may aggravate any form of miners' nystagmus and convert a mild or a latent case into a serious one. If the accident sets up a neurasthenic condition which previously did not exist, the symptoms associated with nystagmus will be still more serious. Excessive drinking or smoking may intensify the condition.

If a miner suffering from this complaint continues in the occupation at which he contracted it the symptoms will in the course of time increase and assume a more serious form. On the other hand, for the disease to be arrested the sufferer must entirely give up work in the pit. The period of recovery will depend largely upon the severity of the symptoms and upon the manner in which the treatment is carried out. Even after recovery relapse is very common, and sometimes under conditions favourable to the aggravation of the disease the patient may have several relapses.

Diagnosis.

It is first of all necessary to decide whether the prominent objective symptoms are due to the nature of the man's employment or not. Nystagmus, or oscillation of the eyeballs, is associated with several diseases of the brain and spinal cord, such as Friedreich's ataxia, syringomyelia, disseminated sclerosis, and tumour of the cerebellum, as well as some congenital diseases of the eye, but the history of the case and the presence of other symptoms should be sufficient to make a differential diagnosis from miners' nystagmus. In all these conditions the movements of the eyeballs or the actual nystagmus are different from those found in miners' nystagmus, in which the movements are much more forcible and rapid, and can be exaggerated much more easily by the methods described.

Clonic spasm of the eyelid is found in many other conditions besides miners' nystagmus; but by systematic examination it is easy, if the other symptoms are considered, to decide in the case of a miner whether the twitching of the eyelids is due to nystagmus. If associated with nystagmus and clonic spasm of the eyelids there are some of the other symptoms to which I have referred, there should be no difficulty in making a diagnosis of miners' nystagmus. It is both important and interesting to know that although nystagmus may be found in the diseases of the brain and spinal cord to which I have referred—Friedreich's ataxia, &c.—in these conditions clonic spasm of the eyelids is never found. In a miner, therefore, who shows the two objective symptoms of nystagmus and clonic spasm one can be certain of the diagnosis of miners' nystagmus.

If no oscillation of the eyeball is observed care is necessary in order to come to a reliable conclusion. Not only may the oscillations be present at some times and not at others, but undoubtedly in some cases of miners' nystagmus no oscillation of the eyeballs is observed at all. In such cases clonic spasm of the eyelids may be the most prominent objective symptom, and if with it headaches, giddiness, muscular tremors, and neurasthenia are found, unaccompanied by any of those conditions which may produce clonic spasm by itself, I think that, apart from the subjective symptoms, the diagnosis of miners' nystagmus is justifiable. Llewellyn points out that it is necessary to exclude cases of high myopia, of which he has seen two examples, as well as such congenital conditions as hereditary nystagmus or albinism.

Causation.

The four most important factors which we have to consider are: (1) defective illumination in the mine caused by the low candle power of the safety lamp; (2) the peculiar cramped position in which miners work, especially the holers and other workers employed at the coal face; (3) the refractive errors found among the miners themselves; and (4) the frequent injuries which miners sustain during their employment, and more especially injuries to the eye itself; but it cannot be said in any case that miners' nystagmus can be caused by any one of these conditions alone, and the real truth probably lies in the fact that the onset of the disease is due to a combination of circumstances. Except at the pit bottom we always find defective illumination in the coal mines of this country; further, in perhaps the majority of cases the men work in a cramped position; refractive errors are at least as common among miners as among other sections of the community, and there is no doubt that miners are by the nature of their employment specially liable to small injuries to the eye, such as abrasions of the cornea. On the surface a worker can see when danger is coming and protect his eyes by means of his eyelids, but in the defectively lighted pit this is impossible. The general feeling at the present time, however, is that the principal factor in the disease is the deficient illumination of the mine, and at the Ophthalmological Congress at Oxford in 1912 it was the unanimous opinion of the members that the principal cause of miners' nystagmus was the poor lighting of the pit.

In the collieries in the Forest of Dean where open lights are entirely used, according to the experience of Sir Frank Brain, only one case of nystagmus has come within the scope of the Workmen's Compensation Act since it became a scheduled disease seven years ago, and in the Black Country where open lights are used to a large extent miners' nystagmus is comparatively rare. In Scotland again, where candles are used to a very large extent instead of safety lamps, nystagmus is much less frequent than in England and Wales. In the metalliferous mines of this country (not including ironstone mines) where naked lights are universally used miners' nystagmus is an unknown disease, and in the ironstone mines it is very rare.

The candle power of a tallow candle will vary according to the number of candles to the pound, but, roughly speaking, we may say that the candle power of an ordinary naked light varies from 0·75 to 1·5. The candle power of a new Davy safety lamp is 0·2 and of a Clanny 0·68, but these figures are materially reduced when the lamp is in use in the pit. The illuminating power begins to be reduced as soon as the miner commences to work, and slowly and progressively diminishes on account of the dusty atmosphere, and also from the fact that no attention can be paid to the condition of the wick and the inside of the glasses. The candle power of the safety lamp may be materially diminished on account of defective ventilation in the workings, and the difference of candle power between the readings measured in the main intake and the main return may vary to the extent of from 25 to 35 per cent.

The second factor in the production of this disease—the cramped position of the miner while at work—is one to which the late Simeon Snell paid special importance. He believed that nystagmus in miners was a myopathy dependent on the peculiar position assumed by a certain class of men in the mine, and that the position of the miner at his work was the prime and essential cause of miners' nystagmus irrespective of the deficient illumination in the pit. He was under the impression that the disease was practically confined to holers and deputies, and to workers who might be subjected to the strain of the elevator muscles, but observations from every coalfield in England now go to prove that the disease is found to a large extent among other workers in the pit—timberers and datallers, roadmen, as well as those employed in other occupations. In the Forest of Dean and in Somerset, owing to the thin seams of coal, the collier is obliged to assume a more or less reclining position, and if Snell's theory be correct one would imagine nystagmus to be very common in these coalfields, but, as I have already stated, it practically does not exist. On the other hand, according to Elworthy the great majority of the colliers in Ebbw Vale work in the upright position, and nystagmus exists in a considerable percentage of the men employed in this district.

There is no doubt that errors of refraction play a most important part in the causation of miners' nystagmus, and injuries to the eye or general injuries to other parts of the body may be the determining factor in the onset of the symptoms. The personal factor in this as well as in all other industrial diseases must be taken into consideration. Certain workers seem to be specially prone to the complaint, and in some instances an undoubted hereditary tendency to the disease has prevailed.

Prognosis.

Speaking generally, if treatment is conscientiously carried out the outlook is quite favourable. Mild cases recover in the course of a few months if the patient be removed from his work underground, but the symptoms in severe cases may not abate for many years, even when the miner has been properly treated and has not worked under adverse conditions. If the symptoms result from an injury to the eye, or if they are associated with an error of refraction or such a condition as cataract or glaucoma, the prognosis is not favourable, and while the correction of refractive errors does a great deal to shorten the course of the disease, still, when the refractive error is of a high degree, even the correction for this defect may not cause speedy recovery.

When neurasthenia is present to any extent the prognosis is less favourable than under any other conditions. There is a great tendency for patients suffering from this neurasthenic type to look on their future in the gloomiest way, and many believe their working days are over. This frame of mind not only keeps alight the general nervous symptoms, but retards the cure of the eye trouble. Marked interference with the visual acuity, the presence of nystagmus in a plane below the horizontal, muscular tremors of the neck and shoulders, ataxic gait, and Romberg's sign must all be regarded as most serious symptoms, and just as a drinking bout or excessive smoking may hasten the onset of symptoms which will prevent the man from working, so over-indulgence will in these respects cause exacerbation of the severity of the complaint.

When a young miner contracts this disease it may be taken that there is some predisposition to it, and a tendency to relapse should he return to work in the mine; in the case of old men the difficulty lies in the slowness of the recovery on account of age and lessened powers of resistance. In all uncomplicated cases, by which I mean those in which there is no permanent injury to the eye such as a corneal opacity or traumatic cataract, the chances of recovery are greater the sooner the man gives up underground work, and some of the worst cases in Llewellyn's experience have occurred in men who have struggled on with their work in spite of the disease.

Mild cases which have apparently recovered may frequently be followed by a relapse if the patients return to their old employment underground, especially when they are employed at the coal face. Even in miners suffering from this disease who do not go back to their work, and when apparently their symptoms have cleared up under treatment, there may be a relapse after influenza or an injury, or, as has already been indicated, after excessive drinking, and in one case I have known a relapse has occurred after going to a kinematograph performance.

Treatment.

The treatment of miners' nystagmus must be considered under two headings: (1) the treatment to be applied to the sufferer, and (2) the preventive measures which may be employed for the purpose of either diminishing the number of cases or eliminating the disease altogether.

With regard to the personal treatment, this will depend entirely upon the severity of the case. In severe cases it is necessary for the man to give up work entirely and to have complete rest. If the examination of the eye shows any refractive error this should be corrected by means of glasses, and in many cases after the patient has become accustomed to the altered conditions under which the muscles of the eye work he obtains some relief, at all events from such subjective symptoms as headaches, giddiness, and nausea, while in some cases these symptoms disappear altogether. Ernest Clarke has pointed out that in neurasthenic cases the correction of small ocular defects is of the greatest importance, and he believes that in many cases the greatest amount of eyestrain results from the smallest error of refraction.

Neurasthenic symptoms must be treated in the ordinary way, and if the patient be suffering from neurasthenia of a marked degree Weir Mitchell treatment should be advised for a period of from four to six weeks. Sufficient attention has not been paid to the application of Weir Mitchell treatment in cases of nystagmus, and the association of miners' nystagmus with neurasthenia has not been sufficiently recognised. As far as I know Weir Mitchell treatment is only properly carried out in England in nursing institutions, or in perhaps one or two hospitals in London devoted exclusively to the treatment of nervous diseases; but in view of the fact that there are many hundreds of coal miners in the different colliery districts of this country incapacitated for work on account of miners' nystagmus associated with neurasthenia, from an economic point of view it is most desirable that arrangements should be made in the hospital centres of colliery districts to provide the best possible treatment in order to bring about speedy recovery. Convalescent cases derive great benefit from change of air, especially at bracing seaside resorts.

In mild cases and in cases which are convalescent a change of employment on the surface may result in great benefit, because the mind is occupied and the patient is not worrying about himself, and, further, the exercise which ordinary manual work necessitates will do a great deal towards improving the nervous condition. Some writers consider that on recovery the miner may be allowed to work in the pit again, and this practice is prevalent to a large extent in all mining districts, but I think to reduce the risk of recurrence it is advisable to place the man at such work that he is less liable to contract the disease than at his previous employment, but if there be any recurrence after this return to different work then the man should never be allowed to work in the pit again.

During illness it is important that the man should lead a well-regulated life. He should keep good hours and should be abstemious with regard to alcohol and tobacco. With regard to medicinal treatment in cases where the nervous symptoms are pronounced, where the appetite is poor and there is sleeplessness, glycerophosphates and bromides may be given with good results, and among the other drugs which have been found to be successful are strychnine and quinine. Romiée has advised the local application to the eye of eserine drops in a 3 per cent. solution three times a day. Atropine has been tried without success. Operative treatment in the form of tenotomy has been recommended in cases of miners' nystagmus, but in every case, as far as I know, in which an operation has been performed, disappointing results have ensued.

Preventive Measures.

Preventive measures may be considered under three headings: (1) Improvement in illumination of the mine; (2) the extension of the use of coal-cutting machines; and (3) efficient ventilation of the workings.

It has been most conclusively proved that defective illumination of the mine is the most important factor in the production of miners' nystagmus, and if the number of cases of this, the most frequently found of all the industrial diseases, is to be reduced we must look to improved illumination and increased candle power of the miners' safety lamp. Every man on his way to and from the face should be compelled to use a shade at the back of his lamp. In many districts where this has been the custom any man omitting the precaution is at once assailed by his fellow workmen. The dancing of the lamps in front is very trying to all, but it is most serious to a man with nystagmus. The number of coal-cutting machines extends considerably every year, and it is to be hoped that this will have its effect in reducing the number of cases of this disease. It is the general opinion of working miners themselves that bad air in the mine is the exciting cause of this disease; whether this be so or not, there is no doubt that bad air has a deleterious effect upon the general condition of the miner, and as we have seen that impaired general health is a predisposing cause of the onset of the disease, efficient ventilation in the mine is an important factor in its prevention.

McMurray has suggested that all miners should be subjected to a systematic examination of the eyes, so that cases with any refractive error or with any other ocular defect can be prevented from commencing or continuing this kind of work. Undoubtedly such a procedure would greatly diminish the incidence of nystagmic cases, but I question whether the Miners' Federation would consent to the institution of such an examination, as it would mean at the present time dismissal of thousands of miners who have worked in the pit all their lives, and who are continuing to do regular and efficient work, and further, it would mean the constant elimination at each periodic examination of numbers of workers who would be deprived of their means of livelihood, and with little chance of gaining employment elsewhere unless it were in the ranks of the casual labourer. If, however, a periodic examination were made, and the power of dismissal were prohibited in case of any ocular defects other than miners' nystagmus being discovered, then it has been suggested that the workers be induced to wear spectacles when on the surface in the hope that by the correction of the refractive error the symptoms of the disease will be decreased in severity.

Incapacity for Work.

Miners' nystagmus is essentially an industrial disease. In spite of the various theories for the explanation of the symptoms it cannot be denied that the complaint is one which is a direct result of the conditions under which the miner works, and in view of the fact that it is a disease to which the Workmen's Compensation Act applies, it is important to consider to what extent incapacity for work may result from it.

In the first place, I would point out that there is no necessary relation between the objective and subjective symptoms. Cases where the movements are very slight may be accompanied by distressing headaches, attacks of giddiness, and other subjective symptoms, while well-marked oscillations sometimes may cause no trouble. It is difficult to tell whether a miner suffering from nystagmus is incapacitated from work or not, and Dr. A. R. Moody, of Stoke-on-Trent, when giving evidence before the Departmental Committee on Industrial Diseases in 1907 said that it was almost impossible to distinguish between a coal miner who had oscillation of the eyeballs, but who was able to work, and the miner who had the same symptoms and was incapacitated by it, and the only way that he was able to judge was by the past history of the man; and Professor Murray, in his evidence before the same committee, admitted that it was very difficult to disprove the assertions of a coal miner with the characteristic nystagmic movements of the eyeballs who stated that he was unable to work.

The objective symptoms by themselves may not cause any discomfort or incapacity for work, but when associated with subjective symptoms we may have a case of total incapacity for work. A great deal, however, depends upon the subjective symptoms, for the existence and severity of which we are compelled to trust to the patient's honesty. Meighan has classified the degrees of incapacity for work under three headings:—

1. Those slightly affected—men who suffer to a slight extent from the characteristic oscillations of the eyeballs—especially when they assume positions that strain the muscles of the eye. These men continue work and never become incapacitated. He believes that 5 per cent. of all miners are affected slightly. 2. Those who suffer from the oscillations and feel giddy at times. These should be obliged to leave off the work in which they are engaged. They may require a rest for six months, but should not return to their old employment. 3. Those who suffer badly from oscillations, headaches, giddiness, and other symptoms mentioned previously. These should give up underground work entirely and never return to it.

When the large proportion of underground workers in whom nystagmic movements of the eye can be observed is remembered it cannot be doubted that the disease may cause little inconvenience, but cases of a severe and distressing nature cause total incapacity for work for a considerable period of time. In some instances patients have been unable to do any kind of work, even light work on the surface of the mine, for several years.

It is most important that firemen and deputies who have suffered from this disease should be able to detect the warning blue cap over the flame of the safety lamp before they are allowed to return to their own employment, and it has been suggested that, considering the great responsibility that rests upon them for the safety of the pit, if they have once had the disease and been incapacitated on account of it, they should have their eyes tested once in every three months.

Complete incapacity for work undoubtedly may occur in cases in which nystagmus is absent or has disappeared, but in which clonic spasm and other subjective symptoms of miners' nystagmus are complained of. Giddiness is the most troublesome subjective symptom from the point of view of capacity for work, and even when the other symptoms, whether they be subjective or objective, are only slight, if attacks of giddiness are at all frequent, and come on without any warning, then the patient must be regarded as totally incapable of work, and it is not safe to give him light work, even on the surface of the mine. The capacity for work after a proper course of treatment will undoubtedly depend upon the actual condition of the eye, and one-eyed men who suffer to any pronounced extent from this disease must be regarded as totally and permanently incapacitated for work underground.

Cases of miners' nystagmus in which neurasthenia is a prominent symptom must be regarded as of a severe type, and although the eye symptoms may be not of a pronounced character the nervous symptoms are such as to cause total disability for work. Like all other neurasthenic conditions, this may last for years, unless the patient undergoes a suitable course of treatment, such as prescribed by Weir Mitchell.

Malingering.

All observers are agreed that it is impossible to imitate the nystagmic movements of the eye, so that there can be no malingering with regard to this, the most prominent objective symptom. There is a difference of opinion as to whether clonic spasm of the eyelids can be simulated or not, but careful observation in any given case will easily detect malingering, as it is impossible for the patient to sustain, but for a minute or so, the twitching of the eyelids, and further, the voluntary movements which are induced by a malingerer are altogether different from those which are seen in true cases of clonic spasm of the eyelids. Dr. Moody has pointed out that the movements in the latter case are quicker and finer, and if a miner attempts voluntarily to blink his eyelids quickly he must bring other muscles into play apart from those which actually blink the eyes, and in Dr. Moody's opinion the man will be easily found out. It should be clearly and widely known among all miners who may imagine that the simulation of this symptom is an easy matter that they are entirely mistaken, and that if they try it on before a skilled observer they will be almost immediately found out. We may therefore say that the two principal objective symptoms cannot be simulated, and if a man be known to have attacks of giddiness and to fall about, to be suffering from night-blindness, and, when tested by Cridland's method, from a diminished field of vision, there can be no question as to the genuineness of the case.

The only difficulty may arise in mild cases, where patients are capable of following some kind of employment, such as light work on the surface or in an occupation independent of coal-mining. In many cases miners with a definite oscillation of the eyeballs are able to do their work without any complaint for years in the absence of headache, dizziness, and other subjective symptoms; but if a miner suffering from such a mild degree of the disease suddenly becomes aware of the presence of nystagmus should he, for the purpose of claiming compensation under the Workmen's Compensation Act, desire to make complaints of headache, giddiness, feelings of sickness, and other symptoms for the existence of which they had to trust to his honesty, it would be most difficult to disprove the statements. The examining doctor would have to take into consideration the man's record for work and his demeanour while under observation, and assistance might be given by friends and neighbours who could testify one way or another as to the man's general state of health. In dealing with such cases it is absolutely necessary to make a complete examination of the man and a special examination of his eyes. I believe that a great deal of help can be obtained by paying special attention to the extent to which the field of vision is limited.

There are undoubtedly many cases of miners who know that they are suffering from miners' nystagmus, but who go on working in spite of the complaint, and it is only when they give up work, either on account of bad trade, or a strike, or because of some quarrel with an official or their employer, that they make a claim for compensation. During the coal strike of 1912 many such cases were recorded in different coal districts of this country. In all disputed cases I would suggest that the medical referee under the Workmen's Compensation Act should rely, not only upon his own examination and the reports submitted to him by the medical advisers of the workmen and the employers, but that he also take into consideration either verbal or written statements of workpeople or other persons who can speak as to the man's previous history and his general condition of health.

LECTURE V.

[The fifth and last Milroy lecture dealt particularly with the conditions found among miners, and known as beat hand, beat knee, beat elbow, and beat buttock, and with the relationship between these industrial affections and the Workmen's Compensation Act. After referring to tenosynovitis about the wrist and miners' itch or rash, the lecturer brought his task to a close with a survey of the effect upon the health of miners which has been produced by changes in the laws affecting their industry.]

THE INFLUENCE OF LEGISLATION UPON THE HEALTH OF MINERS.

From the time that coal-mining came to be recognised as an industry in this country laws were passed to regulate it, but they had special reference to the possession of mining property and for the protection of owners against the violence of their workpeople, and it was not until the year 1842 that any legislation was passed that had a direct bearing upon the health of those employed. In this year the employment of female labour underground was forbidden, and regulations were made to improve the conditions of the boys who were engaged in underground workings. From this time onwards many Acts of Parliament have been passed with the object of improving the conditions of labour and in this way bettering the health of the workers. In 1850 the law provided for the inspection of coal mines; inspectors were appointed by the Home Secretary, and were given power to enter and inspect the works of any colliery, both above and below ground, and to inquire into all matters relating to the safety of the persons employed. For the first time it was made necessary that notices of accident causing loss of life should be sent within 24 hours to the Home Office, and it was made incumbent upon the owners of pits to provide proper plans of the workings and to maintain them in an accurate condition. Subsequent legislation provided for improved ventilation of the workings and that all pits should have two exits.

The laws with regard to the regulation of coal mines were revised and consolidated in the Coal Mines Regulation Act, 1911, which makes special provisions for increased protection for the workmen by a more systematic method of timbering, by regulations which control the use of electricity in the mines, the use of explosives and the methods of firing shots, and mitigate the risk of haulage and shaft accidents. Provision is also made for improved ventilation in the mine; working places where firedamp is present to a greater extent than 2·5 per cent. are deemed to be dangerous, and it is not permissible for men to be employed in an atmosphere charged with firedamp to this extent. Steps have to be taken for the prevention of coal dust. It is now necessary for all colliery owners to provide a sufficient supply of ambulance requisites at convenient places in the mine, and the organisation of rescue brigades is compulsory in all the colliery districts, not only for the purpose of saving life in cases of explosions, but in recovering the bodies and helping to put into proper order working places that have been destroyed by the explosion. Facilities have been increased for investigating a mine after an explosion owing to the fact that it is now incumbent upon colliery proprietors to be able to reverse the ventilating current by means of their machinery on the surface. It is now also necessary for coal-owners to provide proper sanitary conveniences for the use of the men near the pit bottom and at central places along the roadways, and a clause in the Act enables the workpeople to be provided with baths and washing accommodation on the surface, the cost being defrayed jointly by the employers and the workmen.

The time has yet been too short to appraise the benefits of this Act of Parliament, but as far as legislation goes it is certainly a great step in the right direction. But the occurrence of accidents and the prevalence of disease peculiar to the coal miner do not depend altogether on conditions legislation can effect. The long death roll year by year and the tremendous number of non-fatal accidents are in some instances, perhaps a large number, due to the fact that the human factor enters into these occurrences. Just as it is impossible to free a nation from drunkenness by Act of Parliament, so it is, and will be, impossible to free the collier's life from risk of injury. Carelessness or callousness on the part of either the workman or his employer may result in the greatest disasters, and it is a significant fact that if the number of deaths and non-fatal accidents be estimated, not as a percentage of the total number employed, but in relation to each million tons of coal brought to the surface, we find that in the last 10 or 12 years no improvement has taken place in this respect.

Suggested Measures.

Time will show what effect the Act will have upon the health of the miners, but even if the results are as disappointing in the future as they have been in the past, we should not regard ourselves as at the end of our resources. Something must still be done to reduce the yearly death roll and the large number of non-fatal injuries. It might be necessary to have a more thorough and systematic inspection of mines in order that all the provisions which have been made with the object of diminishing these accidents should be strictly observed so as to reduce the number of falls of roof, haulage accidents, and the various other accidents which at the present time are regarded as incidental to the miner's daily work, and to see that the law is carried out to the very letter.

It may be necessary to consider whether the modern mining engineer, who has the sole management and control of any given pit, is sufficiently trained in modern scientific methods to deal with all the problems with which he may be brought into daily contact. Medical men are inclined to believe that their own profession covers as much ground in the realms of knowledge as any of the other learned professions, if not more; but the mining engineer is daily brought in contact with problems of geology, of chemistry, of physics, of engineering, of electricity, as well as of the commercial side of his business. Perhaps the time has come for the heads of the mining profession to realise that specialisation in mining may be the means, not only of working the pits to a greater financial benefit, but also of diminishing to a very large extent the number of injuries which daily take place. Greater advantages should be taken of the facilities for special training given at such Universities as Birmingham and Sheffield, and it seems incredible that, in view of the importance of the profession of mining engineering, comparatively so few students pass through these institutions for the purposes of graduation, although I am happy to say that the numbers now increase year by year.

We have seen that the only hope of diminishing the number of cases of miners' nystagmus is by improving the illumination of the mines, and in my opinion it should be obligatory on colliery owners to supply better illumination along the roadways and at the working face so that the incidence of this disease in the future shall be materially diminished. Expense will be undoubtedly incurred by the inauguration, say, of electrical lamps in addition to the ordinary safety lamp, but I am confident that the owner will be well repaid for his money, not only by the improved health conditions of the workers, but also because the men will be able to see what they are doing, and it is obvious that they can do their work very much better in a good light than in the wretched light to which they are subject at the present time.

Great Britain is the only European country in which there is no legislation to regulate the temperature at which men work in coal mines, and I think that this country should be brought into line with the other principal European countries, and employment forbidden in workings where the wet-bulb thermometer reading is so high as to be injurious to health. I am not going to lay down what the limit shall be. That should be a matter for full consideration, but when we realise that the Lancashire weaver, the Staffordshire potter, and the colliers in France, Germany, and Belgium are protected against working in temperatures recognised to be injurious to the health, I do not think it is unreasonable to suggest that legislation should do at least as much for the coal miner in this country.

I believe that the law should provide for a compulsory medical examination of all applicants for work in mines who have been in the tropics or in the colonies, or who have worked in European mines, or even in the tin mines of Cornwall, where ankylostomiasis may prevail. It is only from such sources that the coal mines of this country can be infected, and every means should be taken to prevent any infection ever occurring.

CONCLUSION.

So much for legislation. Something further can be done, and that by the medical profession. It seems strange that industrial diseases should have been neglected in the medical schools of this country and by the vast majority of the leaders of the profession, and that the researches in this branch of medical science have been left to individual effort. There are thousands of medical men working in the industrial districts of England who have never received any training in the medical schools on the diseases which they may be called upon at a moment's notice to diagnose and to treat. Young medical men who go straight from the hospitals to practise in these districts undoubtedly fail in many instances to realise what these industrial diseases are, and their experience, the experience of all medical men in those districts, is gained at the expense of the patient. I think that a great deal could be done to improve the health conditions of coal miners, and other workers too, if instruction were given at the universities and medical schools in this important branch of medical science. When we think of the tens of thousands of pounds that have been expended in this country upon tropical diseases (with very good results) we cannot but realise how industrial diseases have been neglected, and feel how imperative it is that this matter should have greater attention, and that young men who know that they are going to practise in these industrial districts should have opportunities of making themselves conversant with those diseases and conditions with which they will be brought into daily contact.

MEDITATIONS ON 1000 CONSECUTIVE ABDOMINAL OPERATIONS AT THE PRINCE OF WALES'S GENERAL HOSPITAL, TOTTENHAM.[1]

BY ARTHUR E. GILES, M.D., B.Sc. LOND., F.R.C.S. EDIN.,
GYNÆCOLOGIST TO THE PRINCE OF WALES'S GENERAL HOSPITAL, TOTTENHAM; SURGEON TO THE CHELSEA HOSPITAL FOR WOMEN.

IN October, 1913, I did my 1000th abdominal operation at the Prince of Wales's General Hospital; and it has seemed to me that some useful and interesting information might be derived from a study of these cases. To present an exhaustive report upon them would carry me far beyond the limits suitable for this paper, and I have therefore chosen to offer you some reflections or meditations on certain practical matters and to place before you a few figures derived from an analysis of the cases. The following is an analytical table showing the nature and number of the various operations:—

TABLE I.

Nature of operation.	1st 500.			2nd 500.			Total.		
	Number of cases.	Number of deaths.	Per cent. mortality.	Number of cases.	Number of deaths.	Per cent. mortality.	Number of cases.	Number of deaths.	Per cent. mortality.
Ovariotomy	82	3	3·6	83	3	3·6	165	6	3·6
Salpingo-oöphorectomy for tubal disease	94	6	6·4	60	6	10·0	154	12	7·3
Salpingo-oöphorectomy for extra-uterine pregnancy ...	39	1	2·5	26	0	0	65	1	1·5
Hysterectomy for fibroids ...	92	4	4·3	116	3	2·5	208	7	3·3
" " carcinoma	11	1	9·1	26	0	0	37	1	2·7
Myomectomy	18	0	0	12	0	0	30	0	0
Hysteropexy for displacements	99	2	2·0	123	1	0·8	222	3	1·3
Total gynæcological operations	435	17	3·9	446	13	2·9	881	32	3·6
Exploratory cœliotomy (carcinoma)	16	2	12·5	10	1	10·0	26	3	11·5
Exploratory cœliotomy (inflammatory)	15	3	20·0	9	0	0	24	3	12·5
Bowel operations	15	1	6·6	9	1	11·1	24	2	8·3

To show the way in which the work has steadily increased and the results have steadily improved I will give the figures for successive two-yearly periods from the time when the department was founded to the end of 1913.

---

[1] A paper read at the North-East London Clinical Society on March 5th, 1914.

	Cases.	Deaths.	Percentage mortality.
1900–1	38	2	5·2
1902–3	100	8	8·0
1904–5	122	9	7·3
1906–7	107	3	2·8
1908–9	207	8	3·8
1910–11	232	9	3·8
1912–13	219	4	1·8

Chart I. shows these figures in a graphic fashion. In the first seven years there were 305 cases with 20 deaths, a mortality of 6·5 per cent. In the last seven years there were 720 cases with 23 deaths, a mortality of 3·2 per cent.

Mortality of Abdominal Operations.

Our first meditation may very well be on this important subject. The table of cases shows that there was a marked drop in the mortality of the last 500 as compared with the first 500, the percentage being 3·4 in the later series and 5·2 in the earlier. The improvement may be attributed to three principal causes:—

1. The personal factor of experience. It is not necessary to emphasise this because it is self-evident; nor can any credit be claimed for it because the irreducible minimum required of a man is that his work should improve with increasing experience.

2. A higher standard of asepsis. With succeeding years we have come nearer to the ideal standard; and when I say "we" I include not only the operator and assistant but also the nursing staff in the theatre and in the wards. I venture to say that the better results of late years are in some measure due to the scrupulous care exercised by the theatre sister in carrying out the sterilising work of the hospital and to the devoted care of the sisters of my ward. Another factor in the improvement of asepsis has undoubtedly been the building of the present operating theatre with its more adequate sterilising equipment. Some of you may remember the old theatre with its dust-collecting rafters and its unhygienic walls. The first operation in the new theatre was performed by Dr. Hooper May on June 1st, 1906. If we divide the operations under consideration into two groups, the first from 1900 to June, 1906, and the second from the latter date to the end of 1913, we have these rather significant figures. Before June 1st, 1906, 282 cases, 20 deaths; mortality, 7·1 per cent. After June 1st, 1906, 743 cases, 23 deaths; mortality, 3·1 per cent. I do not claim, of course, that the new theatre alone brought about a saving of 4 per cent. in the mortality, but I feel certain that it contributed to this good result.

3. Improved technique. Year by year sees some improvement in this direction, and the sum of small improvements would make a striking total if it could be appraised. I will mention only two, which have, in my opinion, had a very beneficial effect. The first is the systematic use of gloves during operations. There is no doubt that formerly the presence of a septic case, either in the course of a day's operating or even in the wards, was a source of grave danger to other cases; infection was probably carried by the hands in spite of careful washing and disinfecting. Even now I should put off an operation of election following a case that had unexpectedly proved septic; but an operation of urgency could be undertaken in these circumstances with little fear of bad results. The second point of technique is the introduction of the iodine method for the preparation of the skin in the area of the operation. If this has not directly affected the mortality I feel sure that it has lessened the tendency to post-operative febrile conditions. I may add that the expense of gloves has been amply justified, not only from the point of view of humanity but also from that of economy, because cases do not suppurate as they did formerly, and therefore there has been a great saving in the cost of dressings.

A few words as to the mortality of individual groups of cases. In the table I have divided the operations into two main classes, the gynæcological and the non-gynæcological, the latter coming partly into the domain of general surgery. Here one cannot expect such good results, because the cases include dangerous acute conditions and inoperable carcinoma, and it will be seen that the mortality of this class is 10·9 per cent. for 119 cases. In the gynæcological class the mortality is 3·4 per cent. for 881 cases, and here it will be observed that the group of cases with the highest mortality is that of tubal disease, where it is 7·8 per cent. Many of these cases are, of course, septic to start with. Ovariotomy and hysterectomy for fibroids both show a mortality of something over 3 per cent.; 20 years ago hysterectomy had a much higher mortality than ovariotomy; now its mortality is rather less, and in the later series of 116 cases it was 2·5 per cent. We may expect the mortality of hysterectomy to improve still further, and in support of this view I may mention that there has been only one death in the last 100 cases at the hospital. It is likely that the mortality of ovariotomy will not diminish to the same extent, because the complications of ovarian tumours are liable to be even more inherently dangerous than those of fibroids; moreover, the group of ovariotomy includes some cases of ovarian carcinoma where the operation proves to be of a desperate character, and is only carried through because the removal of the growth offers at least a small chance of life, whilst the alternative to removal means certain death. Extra-uterine pregnancy shows one fatal case out of 65, a result that is very gratifying when we reflect that without operation a large number of these unfortunate women would be doomed to speedy and certain death. Hysterectomy for carcinoma shows a mortality which is perhaps as low as one can expect in view of the formidable character of some of these operations. All the cases of Wertheim's operation of carcinoma of the cervix recovered. Myomectomy had, happily, no mortality. With hysteropexy the mortality should certainly be *nil;* two cases succumbed to pneumonia, and one to an acute oral sepsis. I shall refer to the mortality again in speaking of individual groups.

Age-Incidence.

A study of the ages of patients in different groups brings out some points of interest. I have analysed the ages in 847 cases where the data were available, and the results are shown in Table II.

The graphic method of expressing figures is always more striking and convincing than the tabular method, and I have constructed Chart II. to bring out the facts in the above table. In each group the cases were divided into five equal sections according to their age, and the average age in each

TABLE II.—*Showing the Ages of Patients in Different Operation Groups.*

section was ascertained. Thus in the *ovariotomy* group, with 165 cases, the average age of the 35 youngest is given in Section 1; the average age of the next 35 youngest is given in Section 2; and so for each section. In the group of hysterectomy for fibroids each section has 40 cases; in the group of carcinoma of the body of the uterus each section has only 4 cases.

It will be seen that there is a good deal of variation in the range of ages; thus ovariotomy and hysteropexy for procidentia show a difference of 31 years between the youngest average and the oldest. The actual range of ovariotomy was from 9 years, the youngest, to 68 the oldest—that is, a range of 59 years. That of hysteropexy for procidentia was from 19 to 69, a range of 50 years. The range of carcinoma of the cervix is 31 years on the averages; actually it was 53 years, the youngest being 28 and the oldest 81. Carcinoma of the body has a definitely smaller range than carcinoma of the cervix, and the age rules higher. It is a striking fact that carcinoma of the uterus commencing after the menopause is much more likely to attack the body of the uterus; but when it commences in the child-bearing period it is much more likely to attack the cervix. Incidentally I may remark that the younger the patient the worse the prognosis; and this for two reasons. The first is the fact just brought out, that cervical carcinoma occurs on the average in younger women than body carcinoma; and the chance of recurrence is much less in the latter group. The second reason is that carcinoma of the cervix is apt to run a more rapid course in younger women, and recurrence is more liable to occur in their case.

Extra-uterine pregnancy shows the youngest age-line, its incidence being necessarily within the child-bearing period. Only 4 cases out of 65 were over 40, and 60 per cent. of the cases ranged from 23 to 27. Tubal inflammatory disease is another group with a low age-incidence; this group also coincides with the child-bearing period, and 40 per cent. of the cases were under 30. This point has more than an academic interest; the significance of it is that gonorrhœa, which is responsible for about 95 per cent. of cases of tubal disease, attacks young women usually either before or just after marriage; many cases no doubt clear up, and the patient is able to become pregnant subsequently, but in many others, as shown by the 154 cases of tubal disease operated upon, the disease spreads up to the tubes and the woman's chances of child-bearing are irretrievably destroyed. Some of these women die from septic infection, and, as we have seen, this group is attended by a heavier operative mortality than any other. Nevertheless, operation restores many of them to health, but it does not bring about the fulfilment of their dreams of happy motherhood; it does not restore that married happiness which the presence of children in the home alone can bring; it does not prevent the declining birth-rate, of which gonorrhœa is so important a factor, and the consequent loss of citizens to the State. These considerations are well worthy of the careful attention of those who are earnestly endeavouring to wage an effectual fight against venereal disease; and whilst the common sense of the British race will probably save us from fantastic legislation on eugenic marriages, we may yet hope that an enlightened public opinion will bring about two important measures for the prevention of the spread of disease. The first is the proper control of those great disseminators of disease, the public prostitutes; and the second is the development of such a sense of honour that no man who has contracted any disease will contemplate marriage until he can be assured by a competent medical authority that it is safe for him to do so. Further, if the parents or guardians of girls who are about to marry were to take such a serious view of their responsibilities that they exacted from the prospective bridegroom a satisfactory assurance, backed up if necessary by authoritative medical opinion, of his freedom from venereal disease, such a precaution could not be regarded as quixotic.

The age-incidence of fibroid tumours is fairly wide, though not so wide as that of ovarian tumours. The youngest section averaged 33 years of age; the oldest averaged 56. The youngest patient in this series was 28, and the oldest 65. Retroversion of the uterus has much the same age-range as tubal disease; and unless complicated by prolapse or procidentia it does not occur after the menopause, or at least does not cause symptoms calling for operative treatment.

Observations on Individual Groups.

Ovariotomy.—165 cases, 6 deaths, mortality 3·6 per cent. Every kind of ovarian tumour was met with in these cases: multilocular cystic adenoma; papilloma; dermoid, unilateral and bilateral, and including some of the relatively rare cases of *dermoid contents in multilocular tumours*; parovarian cyst; blood cyst (lutein hæmatoma);

CHART I.

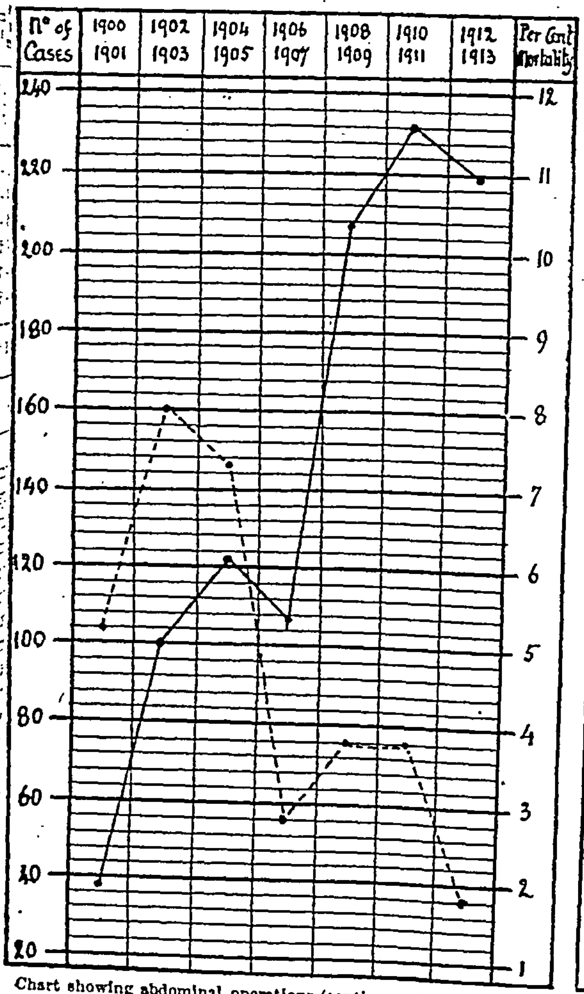

Chart showing abdominal operations (continuous line) and mortality (interrupted line) for 14 years at the Prince of Wales's Hospital, Tottenham. Cases presented in two-yearly periods.

CHART II.

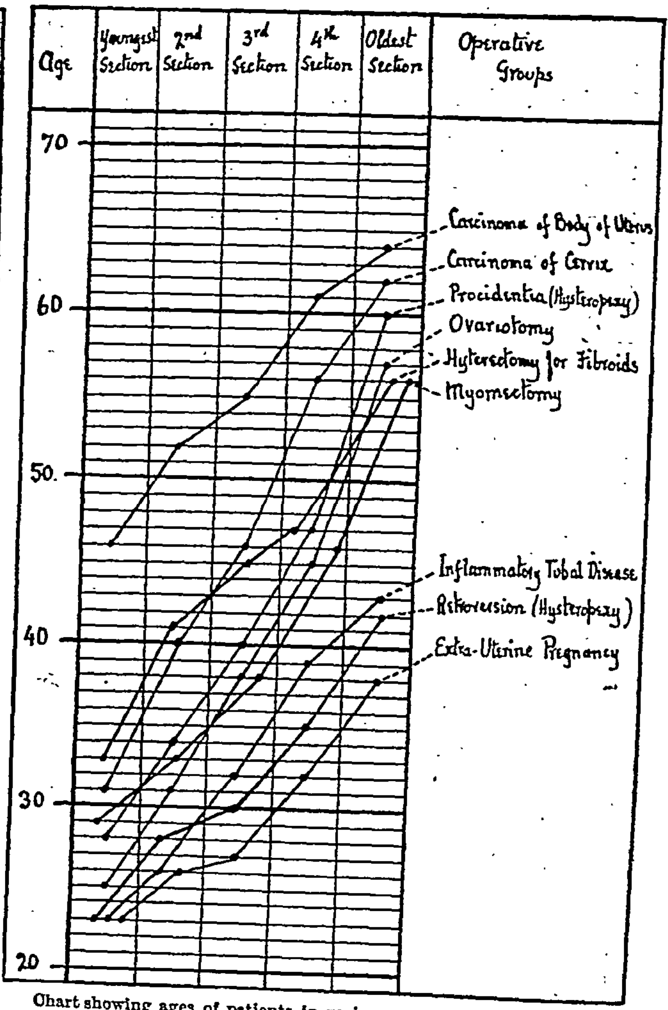

Chart showing ages of patients in various groups of operations. In each group cases are divided into five sections by age, average age in each section being shown.

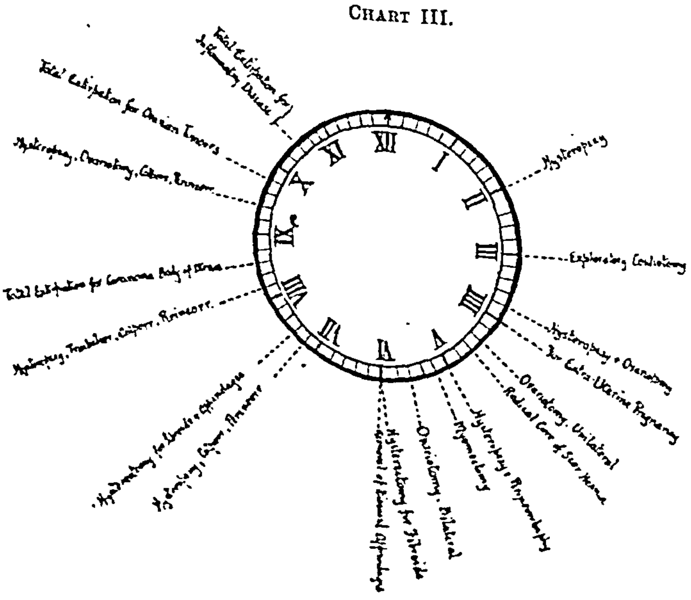
CHART III.



An "operation clock" constructed on a graphic representation of the figures given in Table III. Wertheim's operation, hysterectomy for carcinoma of the cervix, is off the clock, the average time occupied being over an hour and a quarter. The two operations coming next in length are, as might be expected, total extirpation for inflammatory disease (52 minutes) and total extirpation for ovarian tumours (49 minutes). At the other end of the scale a simple hysteropexy averages 10 minutes, and exploratory cœliotomy (which often includes the swabbing out of quantities of fluid) 15 minutes. Other operations occupy an intermediate position.

fibroma; carcinoma; and sarcoma. There were a good many cases with acute symptoms due to twisted pedicle, and several with rupture of the cyst. Many large tumours were met with varying from 10 to 15 lb. and some even larger, in patients of widely varying ages; thus a woman, aged 57 years, had a tumour of 20 lb.; two women, aged 37 and 38, had tumours of 19 lb.; a girl, aged 19, had one of 16 lb.; a girl, aged 17, had a tumour of 15 lb; and another of the same age had the largest tumour of all, weighing 31 lb. Without exception, these large tumours have been removed entire. My reason is the danger entailed by puncture, either from the presence of irritating fluid in the peritoneal cavity, or from the possible dissemination of papillomatous or malignant growths. I have a melancholy recollection of a case at the Chelsea Hospital for Women where a tumour, apparently an innocent multilocular cyst, ruptured during removal, and the patient succumbed within a few months to a rapidly growing malignant papilloma in the abdomen. I do not consider that the long incision required is a serious drawback; it certainly does not predispose to hernia, for although I have had a number of cases of scar hernia, not one of them has occurred with a long incision. In 8 cases ovariotomy was undertaken during pregnancy, without disturbance of the pregnancy in any of them.

The deaths after ovariotomy were as follows: A single woman aged 41. Came in with ruptured ovarian cyst; 18 pints of viscid fluid in the peritoneal cavity. Death from peritonitis, which was already present at the time of the operation. A married woman aged 34; double ovarian dermoid. On the tenth day, which was a visiting day, she was talking to her husband, in good spirits, when she was suddenly seized with pulmonary embolism and died in half an hour. A little girl aged 9; double ovarian sarcoma. The operation was an extensive and formidable one; death from shock. A married woman aged 52; suppurating and infected dermoid; death from sepsis. A married woman aged 27, and another aged 42; both cases of extensive ovarian adeno-carcinoma; both succumbed to shock.

Tubal inflammatory disease.—These cases varied from simple salpingo-oöphoritis with occlusion of the tubal ostium, and hydrosalpinx to pyosalpinx of the most acute type. Several were cases of tuberculous pyosalpinx; one of them, who had also tuberculous disease of the spine, succumbed to a rapidly active tuberculosis. Another left the hospital apparently fairly well, but she died from rapid miliary tuberculosis shortly after. I have been led to give a guarded prognosis in cases of tuberculous pyosalpinx, because although most of them do very well and get quite cured, now and then the operation seems to light up a relatively dormant systemic tuberculosis, and the patient may die quickly. In several cases a pyosalpinx that had evidently been present during pregnancy became active as the result of anatomical disturbances during labour, and simulated puerperal septicæmia; one remarkable case of this type came in with an acute left pyosalpinx two weeks after delivery, and on opening the abdomen I found a septic thrombosis of the left ovarian vein, which I dissected up for about 4 inches. She died from sepsis some days later. Altogether, of the 12 deaths in this group of cases, eight were from sepsis; one was the case of tubercle above-mentioned, one died from syncope from a fatty heart, one died on the table at the end of a very severe operation, and one developed maniacal symptoms after the operation, and while she was swallowing a dose of paraldehyde on the eleventh day she died suddenly from getting some of it down her trachea.

Extra-uterine pregnancy.—This group is a specially satisfactory one because many of them were cases of great urgency, where free intra-peritoneal hæmorrhage was diagnosed by the *patient's medical attendant*, and they were sent into the hospital without delay and operated upon with all possible speed. But for prompt recognition many of these patients would have died, and I take this opportunity of paying a well-deserved tribute to the practitioners concerned. In one such case Mr. Reginald Brown took me away from the annual garden party of this society on July 4th, 1912, to see a patient at Stamford Hill. We carried her down into my car and brought her to the hospital and took her straight up to the theatre, and the operation was finished in a little over an hour from the time of our seeing her together. The one fatal case in this group was one that made a great impression upon me, because I had diagnosed it in the out-patient department as a retroversion of the gravid uterus. I could not replace it, and as I was not satisfied about her I kept her in the hospital. Four days later she had clear signs of internal hæmorrhage and I operated; but she had already bled a great deal, and though she rallied twice after the operation she died from syncope 36 hours after. This was over 10 years ago, and I have always felt since that an early diagnosis might have saved her life.

Hysterectomy for fibroids.—In this group I have included for convenience cases of hysterectomy for fibrosis.

1. Waiting for the menopause is an exploded fallacy; it assumes, first, that hæmorrhage is the only grave symptom of fibroids, overlooking the important symptoms of pain, visceral pressure effects, disablement, and general weakness; and, secondly, that most fibroids shrink or cease to give trouble after the menopause, which is far from being the case. As a matter of fact, out of 575 abdominal operations for fibroids, up to last July, no fewer than 104, or 18 per cent., required operation after the age of 50; and as fibroids may occur in young women some of them would have to wait 10 to 30 years for the menopause.

2. Early operation in young women *will often* allow of a conservative myomectomy, when *delay* necessitates hysterectomy.

3. Fibroids are attended by many pelvic complications. No fewer than 70 per cent. had *complications* of some kind, and there were *dangerous* complications in 30 per cent.

4. Diagnosis is *not* infallible, and *I have* met with many cases where fibroids were diagnosed, and at the time of operation some *serious* condition such as ovarian tumours or carcinoma was discovered, either by itself or in *addition* to fibroids.

5. The argument for delay *based on the* danger of operation, which had great weight *when the* operative mortality was very high, *falls* to the ground now that the mortality has *fallen to 2 or 3* per cent., and it is now permissible and even, as I think, advisable to recommend operation for the relief of suffering and disablement, whereas *formerly* operation was only justifiable for the saving of life.

Fibroids in certain positions, *such as* cervix and broad ligament fibroids, used to cause us great difficulty and anxiety; although *such* operations are still difficult ones they have become much simpler since we have understood the plan of incising the peritoneum over the tumour and shelling this out more or less completely. This procedure allows us to lift the tumour out of the pelvis and to reach the uterine vessels with comparative ease.

Fibrosis is a condition that was very little understood until recent years, and even now its pathology is not quite clear. It is a condition in which the normal musculature of the uterus is largely replaced by fibrous tissue; consequently the contractile power of the uterus, which is such a potent factor in arresting hæmorrhage, is practically lost, and drugs cease to have any influence in promoting such contraction. At the same time the mucosa of the uterus becomes atrophic. The typical fibrotic uterus is usually small; on section its walls are hard and fibrous and hardly any mucosa is seen. Curetting, of course, has no effect, as practically nothing comes away with the curette; and, indeed, the failure of this operation is sometimes the feature of the case that leads to a correct diagnosis. Such a uterus is quite useless, and hysterectomy gives brilliant results in the restoration of these patients to health.

Of the 7 fatal cases 2 died from sepsis, one in 1901 and 1 in 1906. I need hardly say that at the present day we should regard these as preventable deaths. Two died from heart failure, one 15 hours after operation, the other on the seventh day. This will always remain a source of anxiety with patients who have lost a great deal of blood, because with many of them one cannot delay the operation to allow them to recuperate because of the danger of a return of perhaps even severer hæmorrhage. One died from broncho-pneumonia on the fourth day. From time to time I have lost several patients from this cause; and meditation thereon has led me to a much greater caution in operating on patients with chest symptoms. When there is any tendency to bronchial trouble I always postpone the operation, even at the risk of causing the patient great disappointment; but, as I tell them, it is much better to disappoint them than to expose them to an unnecessary danger. One case died from pulmonary embolism on the twelfth day; this is one of the dangers of which at present we have no forewarning, and therefore we are not able to guard against it. Fortunately it is not very common, but I had two deaths from this cause among my 1000 cases. The last death was from secondary hæmorrhage, in a very remarkable case. At the time of operation the large fibroid uterus had an attachment, an inch in diameter, to what appeared to be an enormously enlarged liver; the secondary hæmorrhage was from this site, and at the necropsy the large mass proved to be a huge pedunculated fibroid, with intimate vascular attachments to the transverse colon.

Hysterectomy for carcinoma.—The experience of these cases has led me to the conclusion that the most favourable position in the body in which carcinoma can occur is the body of the uterus, because recurrence after hysterectomy for such a condition is exceedingly rare. On the other hand, recurrence is rather distressingly frequent in cases of carcinoma of the cervix, even when the removal is effected by the most radical means at present known—namely, the procedure called "Wertheim's operation." There are two distinct types of carcinoma of the cervix: one is the so-called epithelioma which arises on the vaginal aspect of the cervix in the squamous epithelium, and when extensive gives the appearance described as a "cauliflower growth." If the growth has not invaded the vaginal walls to any great extent, complete removal is relatively easy and the prognosis is correspondingly good. The other type is the glandular carcinoma, which arises in the cervical glands; it is a treacherous condition, because it is apt to grow extensively within the cervix before it makes its presence known, either by symptoms or by physical signs; and it is specially prone to invade the base of the bladder and the broad ligaments. Some of these cases lead to great anxiety and responsibility in deciding whether or not one should attempt the radical operation; and the difficulty is accentuated by the fact that one cannot always determine how far the bladder is involved until one opens the abdomen and attempts to strip the bladder down from the cervix. My present view is that in bad cases it is not worth while to attempt a radical operation; the operative risk is greatly increased by the danger of injuring bladder or ureters, and the chances of recurrence within a year are very great. On the other hand, thorough scraping away of the growth, followed by the packing of the cavity with gauze soaked in a saturated solution of chloride of zinc, will often lead to the prolonging of life, in relative comfort, for a year or longer. In all I have done 23 cases of Wertheim's operation, and the fact that they have all recovered[2] does not blind me to the possibility that one may at any time have a death after the operation. The one fatal case in this group was a carcinoma of the body of the uterus; the patient died 48 hours after the operation, and the cause of death, as determined by necropsy, was syncope from fatty heart.

Myomectomy.—This operation is to be regarded as the alternative to hysterectomy in certain cases. Meditation on these cases has led me to formulate the indications for myomectomy briefly as follows.

1. It depends on the position of the tumour. Pedunculated subperitoneal fibroids can usually be dealt with in this way, and some cases of pedunculated intra-uterine fibroids. An intramural fibroid can often be enucleated if desired.

2. It depends on the number of the tumours. When only one is present, and sometimes with only two or three, it may be advisable to do a myomectomy. With multiple fibroids myomectomy only leaves a maimed and useless uterus.

3. It depends on the age of the patient. In a young woman, particularly if she is married and anxious to have children, one may make very special efforts to save the uterus by doing a myomectomy; in older women, and when child-bearing is practically out of the question, hysterectomy is nearly always a better operation. There were no deaths in this group.

Hysteropexy.—The best comment that I can make on this group is in the words of Scripture, "By their fruits ye shall know them." From time to time my attitude with regard to these operations has been criticised, and the main criticism has been that I operate too often. I must admit that I am unrepentant, and shall continue to be so as long as the results continue as satisfactory as they have been up to the present time. If patients can be cured of their displacements, whether retroversion, prolapse, or procidentia, by operation; if they can be saved the discomforts and drawbacks of prolonged pessary treatment; if the uterus remains permanently in good position in the vast majority of cases; if the operation in no way interferes with subsequent pregnancy and confinement (and I have now records of 66 confinements to prove this point); if the satisfactory results of operation cannot be obtained by other means; and if I continue to receive from patients and their medical attendants assurances that the patients have experienced the greatest benefit from the operation; and if, finally, I continue to be convinced, as I am at present, that all these suppositions are borne out by experience and by careful study of after-results, so long shall I continue to advocate and to practise the treatment of displacement by operative measures in suitable cases.

---

[2] The last case operated upon died from pneumonia five days after the reading of this paper.

Non-gynæcological operations.—Lengthy comment on these cases is unnecessary. Twenty-six of them—namely, the operations on bowel and kidneys—belong to the domain of general surgery; some of these were operated upon with the expectation of finding other conditions; the rest were special cases in which I was interested, and in which I was allowed, by the courtesy of my surgical collegues, to overstep the usual limits of my "sphere of influence." The cases of scar hernia fell naturally to my lot, as having been responsible in most cases for the primary operation. I have already stated that the most important predisposing cause of this troublesome occurrence is long continued drainage; but in many of these cases one is glad enough to save the patient's life at the cost of such a complication. Another predisposing factor is the condition of flabby abdominal walls in very fat women. The cases of exploratory cœliotomy have caused me to meditate sufficiently to supply material for a separate paper; therefore, as I have still several points to refer to, I will not embark on the subject here.

Duration of Operations.

The duration of operations is a matter of some interest. Dr. C. F. Hadfield, who has given anæsthetics on my operation days since Nov. 26th, 1908, has kept a record, for his own use, of the time that patients have been under anæsthetic; and he has kindly allowed me to make an analysis of his notes. The figures are of special value because they represent the results, not of operating against the clock in particular cases, but of ordinary operative work. Dr. Hadfield tells me that the time from the commencement of anæsthesia to the time of the first incision averages about ten minutes; this includes placing the patient in the Trendelenburg position, painting with iodine, and arranging mackintoshes and towels. From Dr. Hadfield's data I have drawn up Table III.

TABLE III.

Radical cure of scar hernia	17	33	23	20	50
Exploratory cœliotomy for malignant disease or tuberculous peritonitis ...	12	25	15	15	30
Abdominal operations in general... ...	427	40	30	15	100

This table can be represented graphically in the form of an "operative clock," which shows at a glance the average time occupied by the various operations. (Chart III.) Wertheim's operation stands out conspicuously as taking, on the average, about 25 minutes longer than any other operation; the next longest operations are total extirpation for inflammatory disease, with an average of 52 minutes, and total extirpation for ovarian tumours, with an average of 49 minutes. Compound operations such as hysteropexy, with ovariotomy or myomectomy, trachelorrhaphy, colporrhaphy, and perineorrhaphy, average from 41 to 47 minutes. Total extirpation for carcinoma of the body of the uterus averages 43 minutes. Hysterectomy for fibroids, with appendage disease, takes 37 minutes, and the ordinary "round trip" of anterior colporrhaphy, perineorrhaphy, and hysteropexy for procidentia takes 36 minutes. All the other operations range from a quarter to half an hour.

To conclude this part of the subject I give the figures for what I regard as the quickest afternoon's work that we have done at Tottenham; I need hardly say that it could not have been done without excellent system and organisation on the part of the nursing staff and highly skilled administration of anæsthetics by Dr. Hadfield. The figures are taken from his notes. April 4th, 1912: 1. Ovariotomy complicating pregnancy; total anæsthesia, 20 minutes. 2. Hysterectomy and double ovariotomy, for fibroid, left ovarian dermoid and right ovarian cyst, 30 minutes. 3. Hysterectomy and double ovariotomy, for cervix fibroid and double hydrosalpinx, 37 minutes. 4. Hysterectomy for fibroid, 30 minutes. 5. Appendicectomy; resection of cyst in ovary, 23 minutes. 6. Hysteropexy, 20 minutes. 7. For extra-uterine pregnancy, 20 minutes. Total of time occupied, 180 minutes. If we take Dr. Hadfield's estimate of an average of 10 minutes for induction of anæsthesia and preparation in each case, it leaves under two hours actual operating for seven abdominal operations.

Drainage in Abdominal Operations.

"To drain or not to drain," that is the question that often exercises the mind. My meditations on this subject, based on the experience which these cases have taught me, may be expressed as follows. It is certain that there are drawbacks in drainage: the patient has the disturbing factor of painful dressings in the early days; convalescence is often delayed by one or more weeks; when the drainage is prolonged there is a marked tendency to the development of scar hernia; last, and in this case least, from the hospital point of view, drainage means a materially increased expenditure on dressings. But there are also drawbacks in not draining in certain cases; thus, in a case with a tendency to oozing or hæmorrhage from adhesion sites there may be a considerable effusion into the peritoneal cavity which may suppurate later; or the effusion may be so great as to cause alarming signs of internal hæmorrhage; in cases of damage to bowel or bladder where there is a possibility of leakage with consequent infection, and in cases already infected at the time of operation, alarming and even rapidly fatal septic poisoning may supervene. Undoubtedly the risks entailed by *not* draining, when drainage is indicated, are much greater than those incurred by *draining* when it is not really necessary. Therefore, I would say generally of drainage that it should always be avoided if possible, but in certain cases it is essential, and because the danger in this respect of leaving undone the things that ought to be done is greater than that of doing the things that ought not to be done I would say, "When in doubt, drain." The cases in which I drain are those with a considerable tendency to oozing from adhesion sites; cases in which the peritoneal cavity has been soiled with pus from the rupture of pus-tubes or the presence of an appendix or other abscess in the peritoneal cavity; cases of peritonitis without actual pus formation, when I am doubtful about the degree of virulence of the infection; and cases in which the bowel walls have been much damaged in the process of separating adhesions.

Drainage material.—I feel sure that in some cases a fæcal fistula has resulted from the pressure of a hard drain-tube on damaged bowel; I have therefore quite discarded glass drainage-tubes, and even rubber tubing I use very rarely. I prefer to use gauze; sometimes a narrow wick, when the object is to have a warning of hæmorrhage; sometimes a thicker strip when I want to provide a definite drainage channel. It is true that gauze is not a quite efficient drain; but neither is a tube, which is apt to get blocked up. The important thing, however, is to provide a channel leading to the outside, along which pus would pass as the line of least resistance. To facilitate removal of the gauze I use a piece of split rubber tubing, through which the gauze passes in the abdominal wall. When the drain is used merely as an indicator of oozing, or as a precaution in case of infection, and is not likely to be required longer than a couple of days, I commonly pass a suture which is left long and can be tied if necessary, so as to occlude the drain-track when the gauze is left out.

Improvements in After-treatment.

This is a subject of much practical importance, and I will therefore devote it to my concluding meditations. Formerly patients who had undergone an abdominal operation were not allowed anything to drink for 24 hours; the best they could hope for was the tantalising concession of being allowed to wash out the mouth with a little hot water, some of which they would gladly have swallowed, but they might not. The practice now is to give them as much water as they want as often as they like. There is no doubt that the restriction was quite uncalled for; and though it was well enough intentioned, in effect it was inhumane, adding a superfluous torture which was often more trying than any other effect of the operation. After all, if a patient is sick, it is generally because there are some irritating contents in the stomach; and a good drink of water, even if returned, washes out such contents. Moreover, it is notoriously more distressing to retch with an empty stomach than to bring up fluid. The second improvement is that which relates to position. Formerly patients were kept flat on the back and immobile for as long as a week; now they are propped up quite early, and allowed to have their position changed with reasonable and even, if necessary, with unreasonable frequency. Which of us even in health could endure lying on the back without moving for several consecutive hours? Clearly, for patients who are weak and feeling miserable and in pain, the ordeal is much more severe; it aggravates their pain, it brings about muscular stiffness and aching, and it increases the difficulty of contending with the tendency to flatulence which is so marked after operations, and is specially incidental to the recumbent position. The improvement in the general well-being of patients who have been raised up into a sitting position and moved gently from time to time is most striking.

"Fowler's position," as it is called, means sitting a patient upright, with a bed-rest and a knee-pillow and an arrangement of straps to prevent slipping. It was introduced primarily for the treatment of peritonitis, when it was combined with drainage of the pelvis and with the more or less continuous administration of saline solution by the rectal method. I feel sure that this improvement in treatment has been the direct means of saving many lives, not only in cases of suppurative pelvic conditions in women, but also in the domain of general surgery. It is a matter of great interest to note that it was the introduction of this position for septic cases that led to its adoption after abdominal operations in general. We said: "If septic cases are so much more comfortable sitting up, why should ordinary cases not feel better also?" Ordinary cases are, of course, allowed to lie down from time to time, especially when they are settled for the night; septic cases can be kept sitting up for days together, and they sleep quite comfortably in that position. In fact, if one had to choose between persistently sitting up and persistently lying down, the sitting up entails the less discomfort.

Early attention to the bowels is another improvement. I do not say that this is a modern innovation, because 15 or even 20 years ago there were enlightened surgeons who recognised that the greatest safeguard against sepsis and obstruction was to secure early action of the bowels. But the general recognition of this truth is of more recent date. In cases of threatened sepsis or ileus, one of the most satisfactory plans is the administration of small repeated doses of calomel. A half-grain dose hourly until six doses have been given is usually sufficient; and years ago the gynæcologists of the Birmingham school used to give even smaller doses, such as 1/6th grain hourly. Few cases are apt to give one so much anxiety after abdominal operation as those of threatened obstruction, especially when it comes to the point that one has to consider seriously the question of re-opening the abdomen. There are, of course, cases of definite obstruction, where nothing short of operation will avail, and it behoves one to recognise these cases. But there are others, more on the borderland, that can be treated successfully by other means. Some years ago, in the presence of such a case, I was debating operation; my experience of re-opening for obstruction had not been encouraging, and I decided to try the effect of hot fomentations on the abdomen, gentle abdominal massage, and repeated doses of ergotinine hypodermically, the object being to get the paretic bowel to contract. The effect was most satisfactory. Since that time research has given us even more valuable agents than ergot and its derivatives; first we had adrenalin, and more lately the priceless pituitary extract. When the abdomen is blown up and the patient is suffering intense discomfort and pain, when little or no flatus is being passed and we are getting anxious, pituitary extract given hypodermically and repeated if necessary four-hourly, combined with small repeated doses of calomel and a turpentine enema will nearly always relieve both the patient's distress and our anxieties in quite a short time.

At one time no abdominal operation was considered complete unless it was followed by the wearing of a cumbersome and unwieldy surgical belt. Encased in these atrocities patients eked out a prolonged convalescence for a year, and sometimes for years. Their abdominal muscles remained flabby from disuse, and the only persons who derived a solid advantage from these belts were the makers. A parallel may be found in the ancient practice of keeping fractured limbs encased for months in plaster-of-Paris. Now we recognise that in both cases the essential thing is to get the muscles restored to their proper tone by early use and if necessary by massage. For abdominal cases, especially when the three-layer method is used for sewing up, no kind of belt is really required, particularly since the introduction of the long straight-fronted corset, which gives all the protection that is necessary; but many patients derive comfort from a woven binder, of the type of the so-called "cholera belt," which can be worn for a few months. The final improvement is in encouraging patients to a quick convalescence, instead of keeping them invalids, as can be done only too easily by an injudicious form of suggestion. I recognise, of course, the variability of the personal factor; some patients receive a much more profound mental and physical shock from even a slight abdominal operation than others do after a severe operation; but very much can be done by encouragement and by gentle stimulus along the path of convalescence.

I feel that I shall only be rendering a just tribute if, in concluding this summary of my work at the hospital, I acknowledge with sincere gratitude my indebtedness to my fellow workers who have contributed in so important a degree to such success as has attended that work. The governors of the hospital have always given the most sympathetic help to me and to my colleagues in readily granting our requests for whatever tended to facility in our work, and the benefit of our patients. I am indebted to a succession of excellent resident medical officers for help in my operations and for zealous care of the patients afterwards. Several anæsthetists have collaborated with me, and I must express my special thanks to Dr. Hadfield for his most valuable help during the last five and a half years. To Miss Fox and the nurses whom she has trained much more than a formal acknowledgment is due, for I cannot but appreciate the all-important part that good nursing has had in obtaining satisfactory results. To the two sisters who have had charge of my ward since November, 1907, I offer, in all gratitude, this simple statistical tribute: From 1900 to October, 1907, 347 cases, 22 deaths; mortality, 6·3 per cent. November, 1907, to May, 1911, under Miss Ada Simmonds, 387 cases, 14 deaths; mortality, 3·6 per cent. June, 1911, to February, 1914, under Miss Bessie Allen, 314 cases, 9 deaths; mortality, 2·8 per cent.

Upper Wimpole-street, W.

DISEASES OF THE PITUITARY GLAND AND THEIR EFFECT ON THE SHAPE OF THE SELLA TURCICA.[1]

BY E. G. FEARNSIDES, M.A., M.D., B.C. CANTAB.,
B.SC. LOND., M.R.C.P. LOND.,
MEDICAL REGISTRAR, LONDON HOSPITAL; ASSISTANT PHYSICIAN TO THE HOSPITAL FOR EPILEPSY AND PARALYSIS, MAIDA VALE, W.

ANATOMICALLY the pituitary body or hypophysis cerebri consists of two great portions, a glandular anterior lobe and a nervous posterior lobe. Embryologically these two lobes have different origins, the anterior being derived from the epiblast of Rathke's pouch and the posterior from a downgrowth of neuroblast from the region of the third ventricle. Physiologically the anterior and posterior lobes appear to serve different functions, the anterior being related to the general growth of the body and especially of the skeleton, whilst the posterior lobe and its glandular envelope, the pars intermedia, seem to promote the contractility and increase the tone of the plain muscle generally, as well as of the heart, and to excite the activity of certain glands—viz., the kidney and mammary gland (Schäfer). Extracts obtained from the posterior lobe when injected into animals produce changes in the blood pressure, changes in the secretion of the urine and of the mammary gland, and cause contractions of all involuntary muscle, whilst extracts made from the anterior lobe are relatively inactive. By the methods of extirpation of portions of the gland in animals it has been shown that removal of the anterior lobe produces adiposity, accompanied by secondary hypoplasia of the organs of generation in the adult, or by a persistence of sexual infantilism in case the primary hypophyseal deficiency antedates adolescence, and occasionally by polyuria, alterations in the skin and its appendages (such as œdemas and hypotrichosis), and by a tendency to the development of a subnormal temperature and psychic disturbances (Crowe, Cushing, and Homans); whilst the posterior lobe plays a significant rôle in the metabolism of carbohydrates.

The pituitary body lies in the most protected portion of the skull, encased in the bony sella turcica, and in the anterior angle of the optic chiasma. It is separated from the general cranial cavity by a firm fibrous connective-tissue layer, the diaphragma sellæ, a part of the dura mater, which is perforated in its middle to allow of the passage of the infundibular stalk. The most common and most important disorders of the pituitary body are caused by tumour growths arising either in the gland itself or from one of the neighbouring "rests" of the cranio-pharyngeal duct which frequently persists into adult life as an evidence of the double nature of the body itself.

---

[1] A paper read before the Electrotherapeutical Section of the Royal Society of Medicine.

Clinically the disorders which arise in consequence of changes in the pituitary body are extremely complex. For disease processes may originate in either lobe without the involvement of the other, or one lobe may be the seat of an adenomatous change and physiologically overactive, and by pressure upon the other lobe may impair its function and cause an underactivity of this part, or the body may be involved secondarily owing to changes elsewhere inside the cranial cavity, or in some one or other of the interrelated organs of internal secretion—e.g., the thyroid or the ovaries.

In practice patients showing features similar to those obtained experimentally in animals are not uncommon. In the course of the last seven months at the London Hospital I have seen some dozen examples of such cases. In these examples the clinical features appear to have been an expression *either* of a deficiency *or* an excess, *or* an alteration in the activities of one or other or both lobes of the body.

Comparing the disorders due to the pituitary body with those met with in the case of the thyroid gland the custom has grown up to speak of *hyper (super) pituitarism* when the clinical features are believed to be an expression of excessive activity on the part of the gland, of *hypo (sub) pituitarism* when they are assumed to be due to a deficient secretion of the gland, and of *dyspituitarism* when due to more or less complex alterations affecting the secretion of the two lobes together. Acromegaly is believed to be the clinical expression of hyperpituitarism. Dystrophia adiposo-genitalis (Fröhlich syndrome) and some forms of infantilism and of glycosuria are supposed on good grounds to be expressions of hypopituitarism.

In the majority of patients showing hyperthyroidism the thyroid gland shows considerable enlargement. The pituitary body, as we have already seen, lies encased in the bony sella turcica. If an enlargement of the gland takes place either the diaphragma sellæ must be freed from its attachments to the clinoid processes or the bony walls of the fossa must be eroded. In either case the outline of the base of the sella turcica will be altered by disease of the contained pituitary body, and a skiagram will give us definite evidence of these changes.

In acromegaly, in my experience, there is always some definite evidence of an increase in size of the pituitary fossa. In hypo(sub)thyroidism (myxœdema), on the other hand, a small thyroid is the rule; by analogy, therefore, we should expect that in hypo(sub)pituitarism little or no change in the configuration of the pituitary fossa would appear in skiagrams of this region, and this I believe to be a common finding. Like certain cases of Graves's disease, which later take on features of myxœdema, certain cases of acromegaly later take on features similar to those found in hypo(sub)pituitarism; in radiograms of the skull of these patients we should expect to find changes in the sella turcica, and Cushing has shown that this does actually happen.

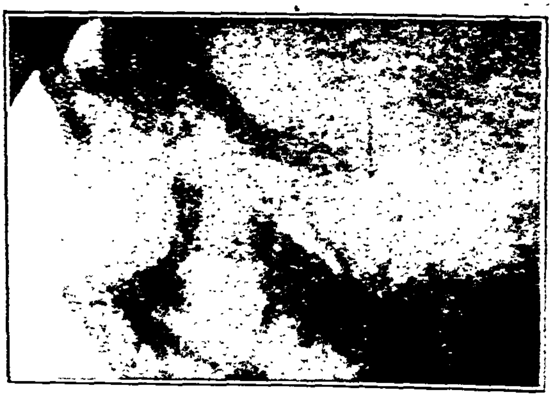
Cushing has divided the enlargements of the sella turcica occurring with primary growths arising from the pituitary body itself into three types: (1) those associated with thickening of the clinoid processes and dorsum sellæ; (2) those showing thinning from pressure absorption of these parts; and (3) those showing more or less destruction of all the outlines of this region; and he states that tumours arising from the pituitary stalk in the interpeduncular region and situated above the sella—the so-called superimposed tumours—give rise to changes in the sella turcica only after they have reached a considerable size (Goetsch). In the skeleton the measurements of the normal pituitary fossa, as given by Keith, average antero-posteriorly (interclinoid distance) 10 to 12 mm., 14 to 15 mm. transversely, and 8 mm. in depth. In profile radiograms measurements exceeding 15 mm. antero-posteriorly and 10 mm. in depth may be looked upon as indicating an enlargement (Cushing). With an undistended sella the floor of the fossa in the skiagram should show a single clear basal outline.

Clinically the 12 cases, which I wish at present to bring under notice (see table) can be divided into—

Examples of Acromegaly	3
,, Dystrophia adiposo-genitalis	3
,, Infantilism and optic atrophy	1
,, Primary optic atrophy and glycosuria ...	1
,, Optic atrophy without any signs of disturbance in general metabolism... ...	1
,, Hydrocephalus, spastic paraplegia, and ataxia of the legs with sub pituitarism	1
,, The "pudding-face" type of dyspituitarism	2

Clinically the three examples showing acromegaly differed widely. In Case 1, a man aged 46, the condition was completely stationary; the skeletal overgrowth had appeared between the ages of 24 and 30, and for 15 years before the patient came under observation for the radical cure of a large inguinal hernia had been completely stationary. Cases 2 and 3, on the other hand, came under observation complaining of the recent increase in size of the extremities and head. In Case 2, a woman aged 40, the overgrowth commenced when the patient was 37 years of age, whilst in Case 3, a man aged 46, changes in the size of the bones began to appear at the age of 44.

FIG. 1



CASE 1.—Acromegaly (stationary). The clinoid processes are displaced upwards. The interclinoid distance measures 15 mm. The floor of the pituitary fossa shows an anterior and a posterior bulge.

The radiological findings in Cases 1 and 2 (see Fig. 1) are similar: in each the clinoid processes are displaced upwards and the floor of the fossa is depressed with the formation of anterior and posterior bulges and the interclinoid distance in each measures 15 mm. In Case 3, on the other hand, the floor of the fossa in the skiagram appears natural, but there is some displacement upwards of the clinoid processes without much alteration in the interclinoid distance, which measures 10 mm.

TABLE GIVING PARTICULARS OF 12 C

Onset of condition and history.	Sex and age.	Sella turcica.	Visual disturbances.	Skeletal signs.	Cutaneous and sub-cutaneous.	Sexual glands.	Tolerance of carbo-hydrates.	Thyroid.	Voice.
CASE 1. *Acromegaly, stationary.* Onset of condition between ages 24 and 30. Eight healthy children ranging from 22 to 8 years of age. Stationary for many years.	M., 45	The clinoid processes are displaced upwards. The interclinoid distance measures 15 mm. The floor of the pituitary fossa shows an anterior and a posterior bulge. (Fig. 1.)	Discs and fundi healthy. Visual fields normal.	Classical signs of acromegaly with enormous hands and feet and great overgrowth of inferior maxillæ. Punchinello chest.	Distribution of fat normal. Cyanosis of hands and feet.	Normal.	200 grammes of glucose given by mouth were not followed by the excretion of sugar in the urine.	Of average size.	Natural.
CASE 2. *Acromegaly, progressive.* Married. Onset of condition at age of 37. Right breast removed for chronic mastitis at age of 33.	F., 40	The clinoid processes are displaced upwards. The interclinoid distance measures 15 mm. The floor of the pituitary fossa shows an anterior and a posterior bulge.	Discs and fundi healthy. Visual fields show some contraction down and out on each side. Central vision for form and colour good.	Classical signs of acromegaly; large hands and feet; great overgrowth of lower jaw. No kyphoscoliosis.	Dry skin and harsh hair suggesting myxœdema.	Catamenia regular.	(Not tested.)	Small, not palpable.	"
CASE 3. *Acromegaly, progressive.* Onset of condition at age of 44.	M., 46	The clinoid processes are slightly displaced upwards. The floor of the pituitary fossa appears natural. The interclinoid distance measures 10 mm.	Old iridectomy R. (at age of 44). Fundi and discs healthy. Left visual field small, right extremely small. Central vision good.	Classical signs of acromegaly; feet and hands large; large lower jaw; head enlarging (larger hat), circumference 22¾ inches.	Distribution of fat normal. Skin dry and harsh.	Normal.	300 grammes of glucose administered by mouth were not followed by the excretion of sugar in the urine.	Of average size.	Natural. Speaks English badly.
CASE 4. *Dystrophia adiposo-genitalis.* History of cranial injury at 10 years of age. Onset of symptoms at age of 17.	M., 20	Shape of sella turcica normal. The interclinoid distance measures 10 mm. and the depth is 10 mm.	Discs and fundi healthy. ? Some limitation of visual fields (not very definite.)	Epiphyses of fingers and toes not joined. Swelling of left fourth toe. Swelling, chiefly peri-articular, of left second and third fingers and of right third and fourth fingers.	Skin soft and feminine. General excess of fat of typus femininus. No excess of pigmentation. No pubic or axillary hair.	Testes and external genitalia small and infantile.	No sugar detected in the urine after the ingestion of 200 grammes of glucose.	Small.	Treble and infantile.
CASE 5. *Dystrophia adiposo-genitalis.* Onset of symptoms at age of 12½.	M., 15	Enlargement of sella turcica chiefly downwards, but there are no bulges on the lower outline. The posterior clinoid processes appear shortened and displaced upwards. The interclinoid distance *measures* 15 mm.	Discs pale with softening of the *edges, no lamina* cribrosa seen. Much limitation of upper and lower visual fields.	Delayed union of all epiphyses.	Skin soft and feminine. General excess of fat of typus femininus. No excess of pigmentation. No pubic or axillary hair.	Testes and external genitalia small and infantile.	No sugar detected in the urine after 200 grammes glucose had been taken by mouth.	"	"
CASE 6. *Dystrophia adiposo-genitalis.* Onset of symptoms at age of 10½ years.	F., 11	Sella turcica shallow and ill-defined. The interclinoid distance measures 5 mm. (at age of 11) and the depth of the fossa is *4 mm.*	August, 1913: No changes in discs. January, 1914: Optic discs pale and atrophic, edges softened, lamina cribrosa present.	Nil.	Some excess of fat. Skin extremely soft and downy. No growth of axillary or pubic hair.	—	No sugar detected in urine after the administration of 200 grammes of glucose.	"	Squeaky.
CASE 7. *Lorain type with optic atrophy.*	M., 19	Extensive, irregular enlargement of the sella turcica. The enlargement has taken place chiefly in a forward direction. There is a very definite *shadow* of a long posterior clinoid process. The interclinoid distance measures 32 mm.	Bilateral primary optic atrophy; onset with left temporal hemianopsia followed by right temporal hemianopsia; then progressive loss of nasal vision to complete blindness 2½ years after onset of *symptoms.*	Delayed union of epiphyses.	Sparsely covered boy. No growth of pubic or axillary hair.	Testes and external genitalia infantile.	No sugar appeared in the urine after 300 grammes of glucose had been taken by mouth.	Of average size.	Treble and infantile.

OF DISEASES OF THE PITUITARY GLAND.

	Blood pressure.	Torpidity and drowsiness.	Psychic disturbances.	Oculomotor nerves.	Other cranial nerves.	Reflexes, &c.	Sphincters.	Urine.	Wassermann reaction.	Weight.	Temperature.	Pulse.
1	—	Nil.	Nil.	Unaffected.	Unaffected.	Reflexes, motion, and sensation unaffected.	Controlled.	Natural.*	Negative.	—	Normal.	60–70
2	125 mm.	Drowsy.	Slow in speech and in movement.	"	"	"	"	Natural.	"	—	"	72
3	—	Attacks of giddiness followed by somnolence and accompanied by intense general headaches and at times by vomiting.	"	"	"	"	"	"	"	—	"	70–
4	60 mm., rising to 120 mm. on treatment with posterior lobe pituitary extract.	Somnolence noteworthy.	Unconscious of changes in himself; dull, intelligent, good tempered; no initiative.	Occasional diplopia. Pupils reacted normally.	Smell unaffected. Weakness of right sixth. Permanent squint. Right nerve deafness.	Knee-jerks exaggerated. No ankle clonus. Bilateral extensor plantar responses.	Attacks of incontinence of urine and fæces usually by night.	"	"	7 st. 10 lb.	Subnormal (96–97° F. morning, 98° evening).	100
5	—	Extremely drowsy.	Dull, good tempered; simple, intelligent; no initiative.	Ptosis, left. No diplopia. Pupils irregular, reacted sluggishly to light.	Smell unaffected. Facial movements irregular. No facial palsy. No deafness.	Spastic gait; adductor spasm; knee-jerks exaggerated; bilateral ankle clonus; bilateral extensor plantar responses.	Controlled.	"	"	7 st. 12 lb.	Subnormal.	90
6	88 mm.	Not noteworthy.	Dull, stupid, slow at learning; intelligent.	Pupils normal; slight ptosis, left; no diplopia.	Smell unaffected, sixth, seventh, and eighth nerves unaffected.	Spastic gait and adductor spasm developed between August, 1913, and January, 1914. Knee-jerks exaggerated, left more than right. Ankle clonus, left. Extensor plantar responses, right and left.	"	"	"	6 st. 4 lb.	"	80
7	100 mm.	Very noticeable; some general headache.	Mental changes developed two years after onset of left temporal hemianopsia.	Some exophthalmos, right and left. Slight ptosis, left. External squint, left. Pupils, no reaction to light (blind).	Weakness upper and lower right half of face. Paresis of right halves of palate and tongue.	Right hemiplegic weakness. Knee-jerks exaggerated. No ankle clonus. Right plantar response extensor.	"	"	"	—	"	80

TABLE GIVING PARTICULARS OF 12 CASES

Onset of condition and history.	Sex and age.	Sella turcica.	Visual disturbances.	Skeletal signs.	Cutaneous and sub-cutaneous.	Sexual glands.	Tolerance of carbo-hydrates.	Thyroid.	Voice.
CASE 8. *Pituitary cyst; primary optic atrophy; glycosuria, with cholelithiasis.* Married; six living children. Menopause at 48 years. Onset of blindness at age of 46.	F., 54	There is much general disturbance of the outlines of the pituitary fossa. No shadow of the clinoid processes can be distinguished: an estimate of interclinoid distance cannot be made. Above the sellar region is a less dense shadow, evidently due to a pituitary cyst. (Fig. 2.)	Complete bilateral primary optic atrophy, with total inability to appreciate light and darkness.	Nil.	Well covered; the fat has a normal distribution.	Menopause at age of 46.	3 per cent. glucose with no acetoacetic acid in urine. The sugar disappeared from the urine on dieting. After operation no change in sugar tolerance.	Of average size.	Natural.
CASE 9. *Optic atrophy; bitemporal hemianopsia: sellar changes.* Onset of hemianopsia, October, 1910. Under observation March, 1912.	F., 32	There is a slight uniform enlargement of the sella turcica, with commencing increase in the distance between the clinoid processes (15 mm.).	Bitemporal hemianopsia. Primary optic atrophy, right and left.	"	No gross abnormalities in fat discovered. At onset of visual changes got "fatter"; now normal again. Hair falling out, skin dry.	Catamenia regular.	Not tested.	Not palpable.	"
CASE 10. *Hydrocephalus; spasticity and ataxia of legs; dyspituitarism.*	M., 5.	The pituitary fossa is shallow. The interclinoid distance measures 10 mm., the depth is 7 mm.	Discs pale, fundus generally pigmented. Vision good.	"	Fat boy with olive complexion. Large head with frontal bossing.	Genital organs very undeveloped.	"	"	—
CASE 11. *Subpituitarism, pudding face type.* Onset of symptoms at age of 18½ years.	F., 21.	Sella turcica well defined. The interclinoid distance measures 10 mm., the depth is 12 mm. (Fig. 3.)	Discs and fundi healthy. Slight general limitation of the fields of vision in all directions.		Well covered; shoulder contours rounded. Fat, red, outstanding cheeks. Hair of scalp dry and curly, of pubes and axillæ harsh and scanty. Staphylococcal abscesses leading to ulcers on shoulders, abdomen, and back.	Amenorrhœa since age of 18½. Rectal examination negative. Mammæ small; nipples pigmented.	No sugar detected in urine after the administration of 180 grammes of sugar by mouth.	"	Harsh, squeaky. "Can no longer sing."
CASE 12. *Subpituitarism, pudding face type; ophthalmoplegia.* Normal till age of 7. At 8 eye movements were lost. Since then no change in vision or in eye movements. One brother, aged 17, and a sister, aged 8. (? congenital abnormality.	F., 15.	Pituitary fossa small and shallow. The interclinoid distance measures 5 mm., and the depth of the sella is 5 mm.	Discs and fundi healthy, no œdema and no atrophy. Visual fields natural.	"	Subcutaneous fat in excess. Fat, rounded, red cheeks. Skin coarse and dry.	Has never menstruated.	Not tested.	Definite goitrous enlargement of thyroid.	Speaks slowly; voice squeaky and childish.

* Admitted to hospital for radical cure of a large right inguinal hernia.

† Admitted to hospital with hepatic c

In Case 1 no changes in the fundus oculi or in the visual fields were present, and there were no signs of local nervous derangements. In Case 2, on the other hand, although the fundus oculi appeared natural, the visual fields showed some contraction downwards and outwards, and in Case 3 there was much contraction of both visual fields, the left being small and the right extremely small. In Case 2 no signs of local nervous involvement were present, but in Case 3 the patient complained of attacks of giddiness and of headache, although no evidence of gross nervous derangements was obtained.

The three examples of dystrophia adiposo-genitalis clinically resemble one another more closely. In Case 4, a boy aged 20, symptoms appeared at the age of 17. In this case there is a history of a fall followed by a period of shock

OF DISEASES OF THE PITUITARY GLAND—*(Continued).*

	Blood pressure.	Torpidity and drowsiness.	Psychic disturbances.	Oculometer nerves.	Other cranial nerves.	Reflexes, &c.	Sphincters.	Urine.	Wassermann reaction.	Weight.	Temperature	Pulse.
	—	Nil.	Nil.	Pupils do not react to light (blind).	Unaffected.	Reflexes, motion and sensation unaffected.	Controlled.	No albumin. 3 per cent. glucose. Bacillus coli in cultures.†	Negative in serum and in cerebro-spinal fluid, and 1 cell per c.mm. in cerebro-spinal fluid.	11 st. 9 lb.	Normal.	60-70
9	—	Intense headaches at the onset with somnolence; these had passed away before the patient came under observation.	—	Light shone into right eye yields no contraction of pupils; into left eye causes both pupils to contract.	"	"	"	Natural.	Negative.	9 st. 6 lb.	"	80-90
10	—	—	—	Unaffected.	"	Spastic and ataxic legs (? cerebellar ? posterior column ataxia). Knee-jerks exaggerated. Bilateral ankle clonus. Plantar responses extensor right and left. Sensation apparently unaffected.	Dribbling; incontinence of urine.	"	Negative in serum and in cerebro-spinal fluid. Pleocytosi in cerebro-spinal fluid	—	"	80-90
11	180 mm. falling to 120 mm. on administration of thyroid extract.	Not noteworthy.	No gross psychic disturbances; had become introspective because her face attracted attention.	"	"	Reflexes, &c., natural.	Unaffected.	"	Negative.	8 st. 4 lb. (5ft. 3in.)	Subnormal.	70-80
12	—	Not noticeable.	Standard VII. at age of 14. Inattentive until objects are seen, then attention is good.	Grave, but not total ophthalmoplegia externa, right and left. No power of convergence, but no diplopia. In good lights pupils at times unequal, but both reacted well to light. Considerable ptosis, right and left.	Smell unaffected. No deafness. Facial movements natural.	Knee-jerks natural. Plantars flexor.	"	"	"	5 st. 2 lb.	"	96-100

due to a gall-stone. Operation. Recovery. After removal of stone from cystic duct no alteration in sugar tolerance occurred.

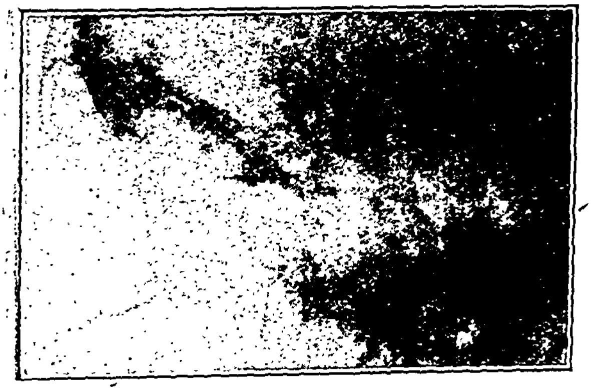
with loss of consciousness lasting some 24 hours, and the development of right-sided internal ear (nerve) deafness at the age of 10. Three years after the onset of symptoms this patient in addition to dystrophia adiposo-genitalis suffered from occasional attacks of diplopia, a permanent squint due to a paresis of the right external rectus, and right internal ear deafness; the visual fields were slightly contracted, but no changes in the fundus oculi were present; the knee-jerks on each side were exaggerated and both plantar responses were of the extensor type. The skiagram of the sellar region, however, showed no definable abnormalities.

In Case 5, a boy aged 15, symptoms appeared at the age of 12½. Two and a half years later he showed softening of the edges of the optic discs and much limitation of the upper and lower visual fields; on the left side ptosis was present; the pupils contracted sluggishly to light, but diplopia had never occurred. He was typically spastic with scissoring of the gait due to a severe degree of adductor spasm. The knee-jerks were exaggerated, ankle clonus could be obtained on each side, and the plantar responses were definitely extensor. The skiagram shows a general downward enlargement of the floor of the pituitary fossa and an apparent shortening of the posterior clinoid processes.

Case 6, a girl aged 11, came under observation in August, 1913. At that time she was fat and her mental condition closely resembled that observed in Cases 4 and 5; her visual fields were normal and the fundus oculi on each side appeared healthy. Under observation she has developed bilateral pyramidal interference with ankle clonus on the left side and both plantar responses are now extensor; the left leg has become extremely spastic and at the same time the optic discs have become pale and atrophic and their edges softened. In the skiagrams of this patient taken in August, 1913, and in January, 1914, the sella turcica appeared ill-defined and shallow.

Case 7 is an example of the Lorain type of dystrophy associated with disease of the pituitary body. At the age of 16 this patient developed a left-sided temporal hemianopsia, followed a few months later by a right-sided temporal hemianopsia and within the space of two and a half years he became totally blind. Shortly after this he developed slight exophthalmos on each side, left-sided ptosis, strabismus, and signs of pressure upon the left crus cerebri. The skiagram of this patient shows an extensive, irregular enlargement of the pituitary fossa; the enlargement has taken place chiefly in a forward direction and there is a shadow of a long posterior clinoid process.

FIG. 2.

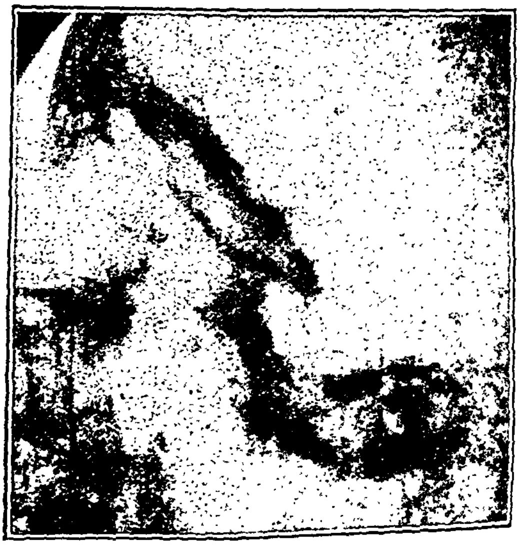


CASE. 8.—Pituitary cyst, primary optic atrophy, glycosuria. There is much general disturbance in the outlines of the pituitary fossa. *No shadow of the clinoid processes can be* distinguished and an estimate of the interclinoid distance cannot be made. Above the sellar region is a less dense shadow, evidently due to a pituitary cyst.

In Case 8, a married woman aged 54, primary optic atrophy developed at the age of 46. In 1908 this patient was under observation in hospital; the only sign of derangement discovered at this time was bilateral white optic atrophy and the urine contained no sugar. In 1913, when she was readmitted complaining of attacks of colic, glucose was found to be present in the urine. As an in-patient she suffered from typical attacks of hepatic colic and a diagnosis of gall-stones was made. This diagnosis explained the attacks of colic and suggested a cause for the glycosuria but not for the blindness. A radiogram of the skull was taken (Fig. 2); this showed a general disturbance in all the outlines of the pituitary fossa, no clinoid processes, but a less dense shadow, evidently due to a pituitary cyst, above the region of the sella turcica. At the operation a single gall-stone was found blocking the cystic duct; the pancreas appeared normal. The suggestion is that a cystic pituitary tumour encroached on the optic chiasma causing blindness, and on the posterior lobe of the pituitary gland giving rise to glycosuria. On the other hand, the glycosuria might be due to pancreatic disease.

In Case 9 the diagnosis of pituitary disease depends solely upon the X ray findings. In October, 1910, this patient developed bitemporal hemianopsia, and in March, 1912, this hemianopsia was the only discoverable manifestation of disease, but the skiagram shows a slight general enlargement with some increase of the antero-posterior diameter of the pituitary fossa.

FIG. 3.



CASE 11.—Subpituitarism ("pudding-face" type). Sella turcica well defined. The interclinoid distance measures 10 *mm.*, the depth is 12 mm.

Cushing has shown that many patients with cerebral tumours, although they vomit freely, do not waste, and that at necropsies on cases which in life have shown signs of increased intracranial pressure the pituitary body often shows signs of compression. From these observations he was led to collect evidence on the frequency of the appearance of manifestations of subpituitarism in clinical examples of increased intracranial pressure, and he states that this is not infrequent. Case 10 is an example of such an occurrence. The patient, a boy aged 5, has a large head and other manifestations of hydrocephalus; in addition he shows spasticity and ataxia of the legs; the knee-jerks are exaggerated, ankle clonus is readily elicited on each side, both plantar responses are of the extensor type, and he suffers from incontinence of urine. The radiogram of the skull of this patient shows an extremely shallow, small pituitary fossa.

Cases 11 and 12 are examples of another variety of dyspituitarism—the so-called "pudding-face" type. Case 11, a young woman aged 21, was perfectly normal until the age of 18½; then amenorrhœa set in, her hair fell out, and her voice changed; shortly after this her face grew fat and "pudding-like" and her hair grew thick and curly. Since this time she has not menstruated and no further changes in her appearance have occurred. The blood pressure in May, 1913, was 180 mm., but under the administration of thyroid extract it fell to 120 mm. No abnormal nervous signs have ever been discovered. The skiagram of the skull (Fig. 3) shows a rather deep sella turcica (12 mm.) with well-defined lower margins and no change in the antero-posterior diameter. In many ways this case resembles a case of myxœdema, but treatment with thyroid extract has not removed any of the disabilities. Case 12, a girl aged 15, is said to have been normal until the age of 7; then in the course of a few months an almost complete external ophthalmoplegia associated with bilateral ptosis developed. At the age of 15 she has never menstruated, and is an undeveloped girl showing no secondary sexual characters, a large "pudding-face," and extremely defective external eye movements, but no other nervous signs. Her thyroid shows considerable enlargement with the development of a goitre. The radiogram of the skull shows an extremely small and very shallow sella turcica, measuring antero-posteriorly 5 mm. and 5 mm. in depth. The suggested explanation of the clinical findings is that some change has occurred in the activities of the pituitary gland; the development of an enlargement of the thyroid gland is in accordance with this hypothesis.

In addition to the changes in general metabolism disease processes arising in the pituitary body owing to the anatomical relations of the gland to the optic tracts, to the third cranial nerves, and to the crura cerebri, early give rise to localising nervous signs. The appearance of these together with the changes known to occur when the activities of the pituitary body are deranged, or with radiographic changes in the conformation of the sella turcica, renders diagnosis of pituitary disorder more certain than in other intracranial conditions. In doubtful cases a change in the size or shape of the sella turcica as seen in the X ray plate is at present the most certain evidence of pituitary disorder.

My best thanks are due to Mr. F. S. Kidd, Dr. H. Head, Dr. R. Hutchison, Dr. R. C. B. Wall, Dr. Lewis A. Smith, and to Mr. A. B. Roxburgh for permission to publish the cases which have been under their care, and to Dr. Gilbert Scott who took the skiagrams.

Queen Anne-street, W.

A CASE OF TRIPLETS SUCCESSFULLY BREAST-FED.

BY JAMES MORRISON, M.D. LOND.

ON Nov. 3rd, 1913, I was called to see a woman, aged 37, who had been confined of triplets—two girls and a boy. The mother had previously had seven children. The babies were small and immature, though born at full time. They had been fed at the breast throughout, but were not thriving; there was marked absence of subcutaneous fat, and the skin was wrinkled and red. The respective weights at birth were: James, 5 lb.; Violet, 4¾ lb.; and Rose, 4¼ lb. On Nov. 3rd, when four weeks old, their weights were: James, 4 lb.; Violet, 3¾ lb.; and Rose, 4 lb. On Oct. 29th a sample of mother's milk was drawn off and reported upon as follows: Specific gravity, 1035; fat, 1·06 per cent.; carbohydrates, 7·91 per cent.; proteids, 0·63 per cent.; salts, 0·26 per cent.; and water, 90·11 per cent. The children were quite healthy, but weakly, crying, and fretful, and evidently not getting enough nourishment. The mother was given lactagol in order to improve the quantity and quality of the milk, which was very deficient in fat and proteid; she took on an average two teaspoonfuls three times a day.

On Nov. 10th, a week later, the boy was distinctly weaker and had got a bad cold. I therefore instructed the mother always to give him first feed, and for a time to draw off the milk and feed him with a spoon to be quite sure he got food. In a few days' time he picked up. On the 17th the mother had a bad influenza cold with herpes on the cheek and pains between the shoulders; she was feeling the wear of feeding the three children. The cold was treated with salicylate of soda, and later quassia and iron mixture; a small follicular abscess had to be opened on the left breast. She was now able to draw off from four to five teaspoonfuls of milk at a time with a breast pump to feed the boy. On the 18th another sample of milk was taken, the report being as follows: Specific gravity, 1035; fat, 1·65 per cent.; carbohydrates, 6·61 per cent.; proteids, 1·81 per cent.; salts, 0·274 per cent.; and water, 86·69 per cent. This showed a distinct improvement in the percentage of both fat and proteids.

On Nov. 28th the three children were all distinctly thriving and filling out; the mother's breasts were fuller and the children cried less. The mother had lost her aches and pains and was feeling well. From this date onwards the children made distinct improvement, the mother's milk being good in colour and consistency, the children sleeping better and crying less. The mother got a little distaste for the lactagol about this time, so the quantity given was lessened for a period, but eventually we were able to give increased amounts without any complaint.

On Dec. 19th a third report of the milk was obtained as follows: Specific gravity, 1035; fat, 1·90 per cent.; carbohydrates, 6·58 per cent.; proteids, 1·442 per cent.; salts, 0·270 per cent.; and water, 89·72 per cent. This report showed a further increase in the percentage of fat.

On Jan. 10th, 1914, the child Rose was found to have a slight left inguinal hernia and protrusion of the navel, but all three babies were gaining steadily in weight. On Feb. 9th the milk was again examined and the report was as follows: Specific gravity, 1036; fat, 1·3 per cent.; carbohydrates, 6·57 per cent.; proteids, 1·78 per cent.; salts, 0·195 per cent.; and water, 90·11 per cent. This showed a slightly lower percentage in fat and a distinct increase in the percentage of proteid. The mother could now easily feed the three children without feeling run down, and the latter have steadily been gaining weight up to the present time.

Weymouth-street, W.

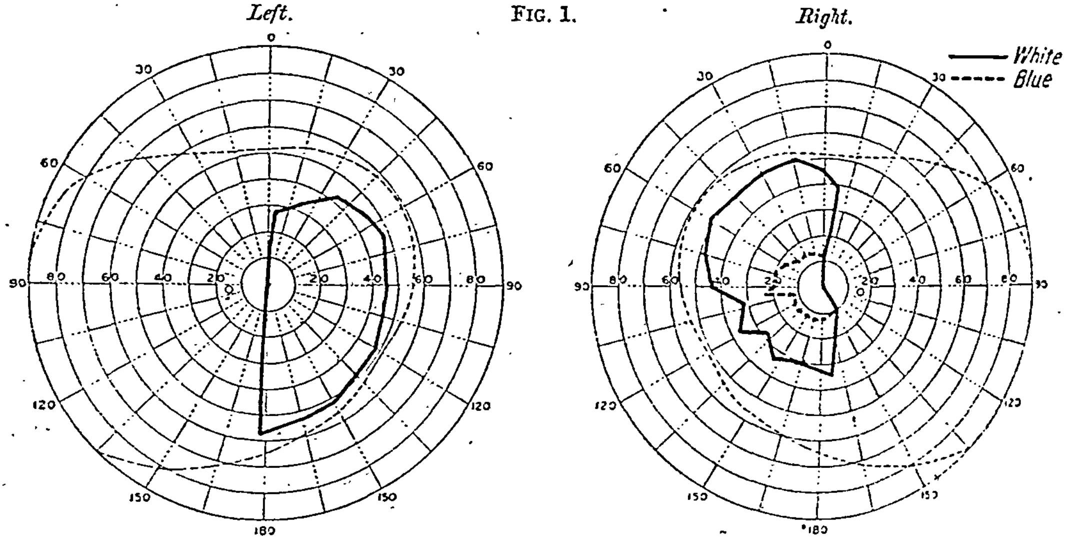
NATIONAL ASSOCIATION FOR THE PREVENTION OF INFANT MORTALITY AND FOR THE WELFARE OF INFANCY.—A deputation from this association interviewed Mr. Masterman at the offices of the National Insurance Commission on June 25th to urge that the administration of the maternity benefit and also any future extension of the care of maternity should be in the hands of the public health authorities. The deputation consisted of Mr. Benjamin Broadbent and Dr. S. G. Moore (Huddersfield), Dr. John Robertson (Birmingham), and Dr. Eric Pritchard and Dr. Amand Routh (London).

A PATHOLOGICAL INVESTIGATION OF FOUR CASES OF PITUITARY TUMOUR.

BY W. JOHNSON, M.D. LOND., M.R.C.P. LOND.,
GULL STUDENT, GUY'S HOSPITAL.
(*From the Pathological Department, Guy's Hospital.*)

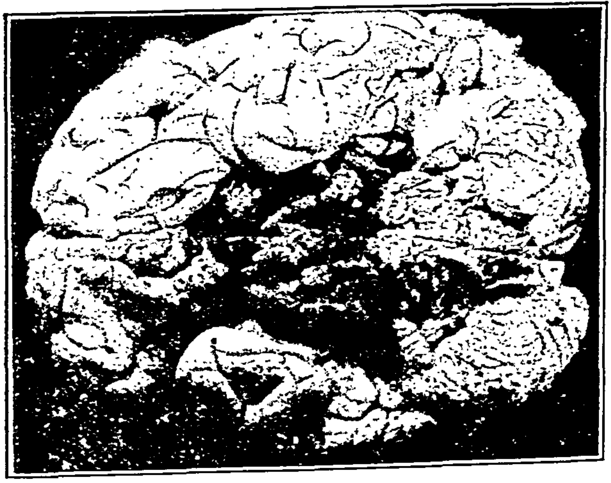
IN view of the comparative rarity of tumours of the pituitary body and of the interest recently aroused in them, the publication of the pathological investigation of four fatal cases from Guy's Hospital may prove of value. The first two descriptions are taken from cases which came to necropsy during the past year. The last two are from specimens in Guy's Hospital Museum which date back to 1883 and 1877 respectively. In the first case advantage has been taken of the fact that a complete examination of the eyes had been made by Mr. H. L. Eason to undertake an inquiry into the extent of the degenerative changes resulting in the visual system of nerve fibres and cells. In the second case, also, degeneration has been demonstrated in the optic tracts, but unfortunately in this instance it cannot be correlated with the state of the fields of vision.

FIG. 1.



Perimeter chart (Case 1).

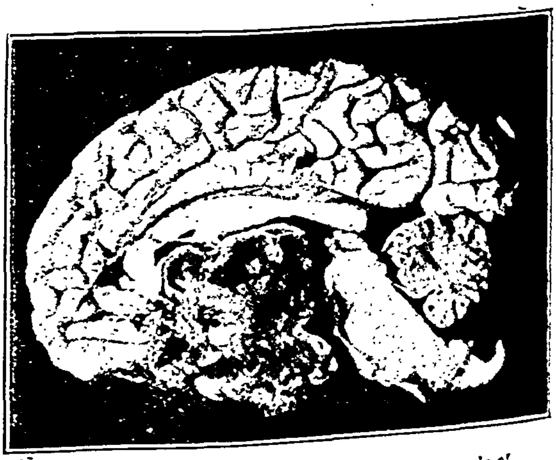
FIG. 2.



View of the tumour *in situ* (Case 1).

CASE 1.—The patient, a man aged 27, formed one of the cases of pituitary tumour which Mr. Eason showed before the Royal Society of Medicine in May, 1913, at a meeting of the combined Sections of Neurology and Ophthalmology.[1] A short summary of the clinical report is as follows: The patient was short and undeveloped, with a lack of hair about his face and pubes. The voice was half broken and high-pitched. He was extremely drowsy and slept most of his time. Weight 7 st. 10 lb. Looked much younger than his age, being almost boyish in appearance. Examination of his eyes showed complete bilateral temporal hemianopia. The fields of vision are given in Fig. 1. Vision: R., 6/36; L., 6/9. The reaction of the pupils to light on both sides was hemiopic. The Wassermann reaction was positive, but treatment with mercury, iodides, thyroid and pituitary extracts resulted in no improvement in vision or in any other way, except that the headache was diminished and the weight slightly increased. A skiagram showed some enlargement of the sella turcica. The blood pressure was found to be 100 mm. of mercury. Latterly he had suffered from severe enuresis. The skin was brownish in colour. A condition of semi-coma prevailed during the last three weeks.

FIG. 3.



Mesial section through brain and tumour. The capsule of the tumour lies close up against the corpus callosum. The hæmorrhagic cysts are well seen.

Pathological examination.—Emaciation was marked. There were no bony changes, either atrophy or enlargement, present. The heart weighed 190 grm. and showed an early condition of brown atrophy. The liver weighed 1090 grm. It was pale yellow in colour, and appeared to contain excess of fat. The pancreas (42 grm.), the thyroid (10 grm.), the spleen (102 grm.), the suprarenals (11 grm.), and the kidneys (294 grm.) all seemed perfectly normal macroscopically. The testes were normal in consistency, but were a little small (abstract from Dr. Herbert French's report).

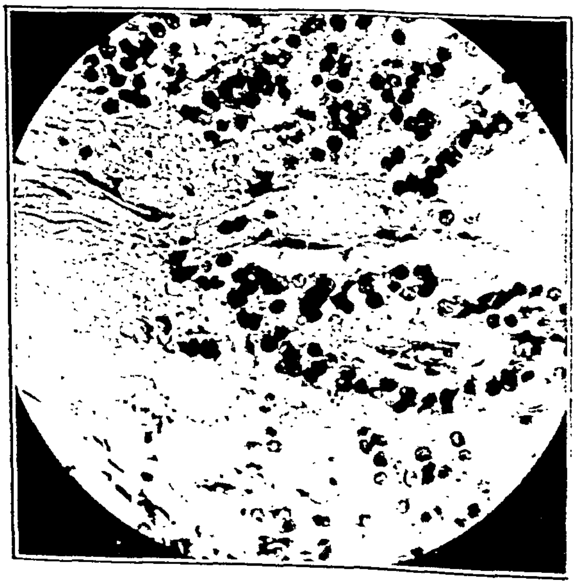
---

[1] Proceedings, vol. vi., No. 7, p. 7.

In the position of the pituitary body was found a bright red irregular tumour, contained in a definite tough capsule, and which had numerous white necrotic areas scattered through it, especially towards the centre. The substance of the growth was soft and hæmorrhagic, and contained several cysts filled with altered blood. The appearance of the tumour is shown in Figs. 2 and 3, reproduced from photographs. It completely occupied the interpeduncular space, extending forwards to reach the orbital portions of the frontal lobes, and spreading laterally over the surface of both temporal lobes. Posteriorly, it separated the crura cerebri widely from each other and then extended over them, covering the upper portion of the pons. A mesial section through the brain and tumour shows the basal ganglia and corpus callosum to be displaced upwards. The superior and inferior walls of the lateral ventricles were in close apposition, their cavities being practically obliterated. The pressure on the base of the skull had resulted in absorption of the original bone forming the sella turcica, and only a thin shell of bone still remained surrounding the greater portion of the tumour. The third, fourth, and sixth nerves on both sides were stretched by the growth. The optic chiasma was broken through in such a way that the right and left optic nerves appeared to be direct continuations of their respective tracts. The degenerative changes found in the optic tracts suggest, however, that this destruction of the chiasma was of comparatively recent date. The brain and meninges appeared perfectly normal macroscopically. It was possible to shell out the tumour quite easily from the bed which it had forced for itself in the base of the brain.

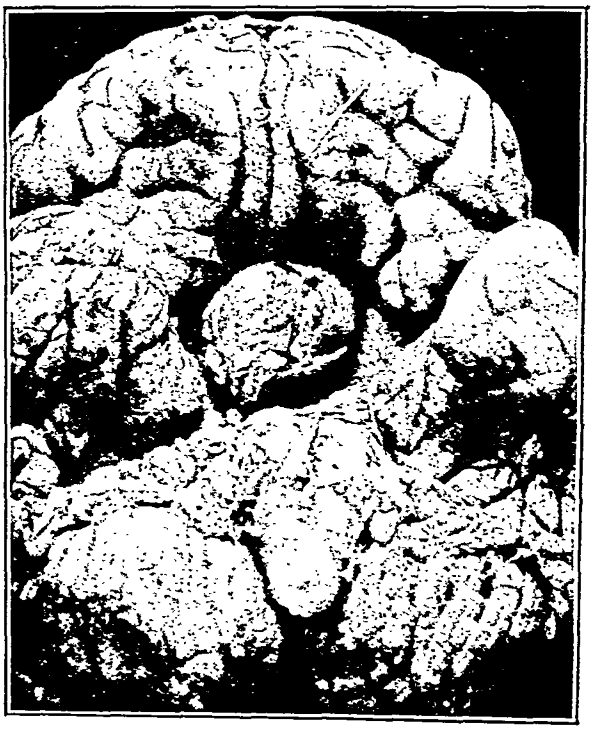
Microscopical examination.—Sections were examined of portions of the thyroid, pancreas, suprarenals, liver, and testis. Thyroid: The alveoli appeared well formed and contained the normal amount of colloid. There was no evidence of cell proliferation, and the interstitial tissues were normal in appearance. Pancreas and suprarenals: The structure of these organs was that of normal functioning glands. Liver: Extensive fatty change was present throughout the section, and was confined to the peripheral portions of each lobule. The cells in the centre of the lobule were normal in appearance and there was no cirrhotic change. Testis: The seminal tubules were normal in number and in character. There was a slight increase in the interstitial connective tissue, indicating a very early fibrotic change. Sections were examined with special reference to the condition of the interstitial testicular cells. These were markedly deficient in number. Several sections were examined from various parts of the testicle. Stained with Herxheimer's stain the few interstitial cells present were found to be in a somewhat atrophied state. The pituitary tumour itself under the microscope was seen to be made up of large polyhedral cells, the protoplasm of which stained a faint pink and the nuclei a dark blue with the ordinary hæmatoxylin and eosin method. The chromatin granules show up distinctly in these latter. The cells themselves are arranged in long columns, with occasionally a tendency to alveolar grouping, the whole appearance closely simulating the structure of the anterior glandular portion of the pituitary. No colloid material was discovered, and nothing corresponding to the posterior lobe was seen. The vascular spaces characteristic of this organ were well marked, and towards the centre of the tumour they became large hæmorrhagic cysts in which red blood cells were mixed with necrotic tumour cells. Towards the periphery, however, they became smaller and smaller, until when the capsule was reached they ceased to exist. The capsule was thick and consisted of dense fibrous tissue. In numerous places the cells of the growth were extending into the capsule along the lymph channels. (Fig. 4). Its appearance, therefore, was that of a malignant epithelial tumour of the pituitary gland. The entire absence of secondary deposits is noteworthy.

FIG. 4.



The upper portion of the field shows the edge of the growth. The lower portion shows up the capsule being invaded by groups of tumour cells. (Case 1.)

FIG. 5.



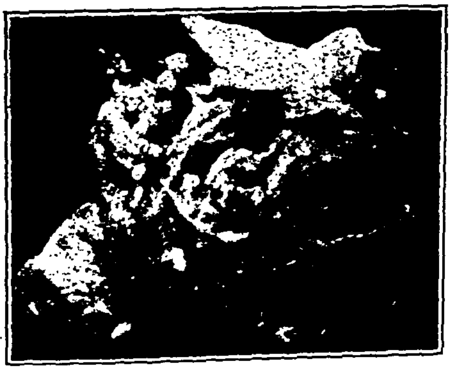
View of tumour in Case 2. The cyst has been distended with cotton wool to its normal size.

CASE 2.—The patient, an unmarried woman, aged 27, was admitted into Guy's Hospital under the care of Mr. L. A. Dunn. She had had continuous headache for the previous three weeks accompanied by vomiting. The left eye was completely blind, and the vision in the right eye was markedly defective. Both eyes reacted to light and accommodation, but the reaction of the left was very deficient. The patient was seriously ill and died shortly after admission, so that a detailed examination of the eye condition was impossible. She was extremely lethargic Pulse 55 and low tension. Temperature subnormal. The left eye showed a definite degree of exophthalmos as compared to the right. Further details have been kindly supplied by Dr. H. J. Henderson and Mr. L. C. D. Irvine, of Amersham, who attended the patient in private. They state that, in spite of her age, menstruation had never occurred. The breasts were undeveloped, and there was complete absence of pubic and axillary hair. Nothing is known of the sugar tolerance, but for some time past she had shown a great partiality for sweet things, and had been used to taking bread and butter thickly coated with brown sugar. A year ago Mr. Arnold Lawson had examined the eyes and found advanced optic atrophy in the left eye. This was confirmed on the examination of the patient here. There was no sugar or albumin in the urine.

Post-mortem examination.—With the exception of the tumour nothing abnormal was found in any of the organs (Dr. Herbert French's report).

The tumour: In the position of the pituitary body, filling up the interpeduncular space, there was a cystic tumour, the relations of which are shown in Fig. 5. It measured ¾ inch antero-porteriorly and 1¼ inches from side to side, and was almost exactly the size of a golf ball. On removal a deep hollowed-out depression was found at the base of the brain. The sella turcica, on which the tumour had rested, was flattened into a shallow concave surface. The vessels of the circle of Willis were present on the lateral walls, indicating that the original cyst had been small enough to be within the circle, and that as it enlarged the vessels became stretched on its outer walls. The optic chiasma lay stretched over the antero-inferior portion of the tumour, and had apparently given way through its centre. The right optic tract and nerve were not much damaged, but the portions of the left optic tract and nerve near the chiasma were pressed out into a wide thin band. The tumour was pressing them down on to the hard bone at the base of the skull. On the other hand, the third and fourth cranial nerves, lying between the tumour and the soft structures forming the base of the brain, showed little or no flattening. On being cut through the tumour was seen to consist of one large cyst composed of two loculi, which communicated freely with each other, and they contained a thin reddish fluid. The wall of the cyst was tough and fibrous, and scattered over its surface there were four or five small masses of a reddish glandular substance closely similar in appearance to the anterior pituitary lobe. The largest was of the size of a pea and the smallest about half this size. In addition there were still smaller masses of the same nature to be found scattered over the surface. The larger ones are shown in Fig. 6, which is about natural size. It also shows the division into two loculi—the large one which formed the main portion of the cyst, and the smaller one which occupied the right anterior angle of interpeduncular space.

FIG. 6.

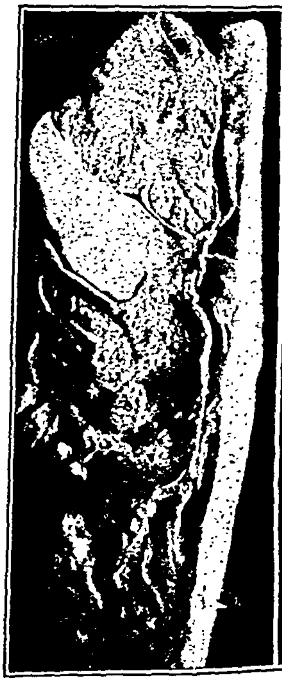


From a photograph (actual size) of the tumour in Case 2, showing the glandular masses in the capsule.

Macroscopically the brain was normal in every way, with the exception of a slight degree of dilatation of the lateral ventricles. Under the microscope the cyst wall was seen to consist mainly of laminated fibrous tissue. Everywhere between the laminæ were to be seen small collections of cells, which in places were aggregated to form the red glandular masses already referred to. The arrangement and character of these cells to all appearances were those of the anterior lobe of the pituitary. Large spaces packed with red blood corpuscles lay between the columns into which the cells were arranged, and in places large hæmorrhages were present. The cells themselves were polyhedral or oval in shape, and had large dark nuclei. The majority were chromatophobes, but several approximated to the chromatophilic type. More externally they showed the same tendency to infiltrate the layers of the cyst wall, as was seen in the first tumour. It can only be described, therefore, as of the same nature—viz., a malignant epithelial tumour of the pituitary gland, with complete absence of secondary deposits.

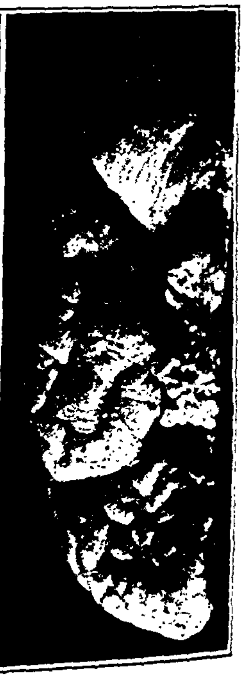
CASE 3 (Specimen No. 2876 in Guy's Hospital Museum).—The patient was a male, aged 23, who died in 1883. He had been under the care of the late Dr. F. W. Pavy and Dr. Frederick Taylor. There was a history of a head injury and concussion 15 years previously. Three years before admission he had had vertigo and frontal headache, and for the last 18 months the vision in the left eye had been failing. On admission the left eye was completely blind, and there was also partial loss of vision in the right eye. He was a dark muscular man, but no mention is made as to sexual development. Apart from headache, there were no other symptoms.

FIG. 7.



Mesial view of No. 2876 showing the capsule of the tumour lying just beneath the corpus callosum as in Case 1.

FIG. 8.

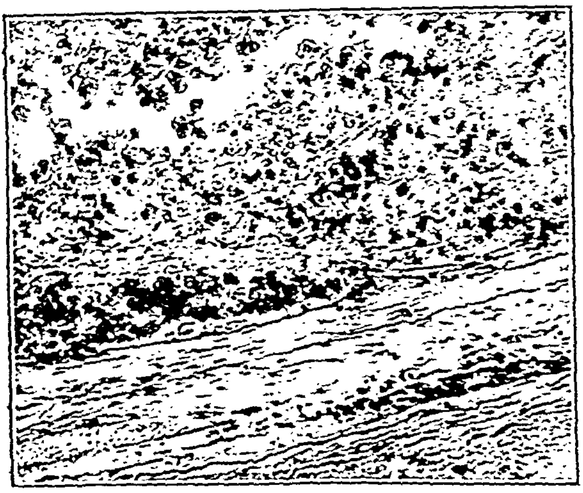


View of the left half of the brain, No. 2876, showing the position and appearance of the tumour.

Post-mortem examination (by Sir James F. Goodhart).—The pituitary fossa was enlarged to form a diamond-shaped space, in which lay a soft lobulated tumour. This occupied the position of the pituitary body and extended forwards over the ethmoid; laterally it overlapped the temporo-sphenoidal lobes, and posteriorly it covered over the upper part of the pons. On the left side the optic nerve and third, fourth, and fifth nerves were pressed into flattened bands. On the right side the optic nerve and third nerve were lost in the tumour, while the fourth and fifth nerves were stretched over it. The other cranial nerves were unaffected. (Figs. 7 and 8.) The tumour itself was more or less circular in outline and measured 2½ inches across. On section, thick cream-like material oozed away, leaving numerous cystic cavities with ragged walls.

Under the microscope the tumour was found to consist mainly of cellular elements, the cells being the chromatophilic type, though somewhat smaller than the cells in the two previous tumours. With the exception that there is much less stroma present, the general appearance, however, closely approximates to them. There is the same tendency for the cells to form columns and an alveolar arrangement, and also for those on the periphery to infiltrate the layers of the capsule. (Fig. 9.) With the other two, therefore, it must be classed as a malignant epithelial tumour of the pituitary gland, showing no tendency to form secondary deposits.

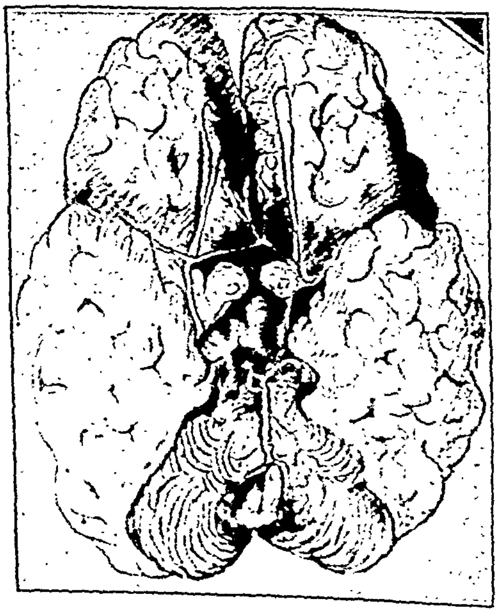
FIG. 9.



Reproduction of a photomicrograph of No. 2375 showing cells at the edge of the growth infiltrating the capsule.

CASE 4 (Specimen No. 2875 in Guy's Hospital Museum).—The patient was a male, aged 45, who died in Stephen Ward in 1877. He had been under the care of Dr. Samuel Wilks. He was a thin, wasted man. Three weeks before admission he was seized with fits which were followed by left hemiplegia. On admission there were loss of memory, occipital headache, and nausea, but no vomiting. The vision was dim, but no definite optic neuritis or optic atrophy was present. The left external rectus muscle was paralysed. The patient was often delirious.

FIG. 10.



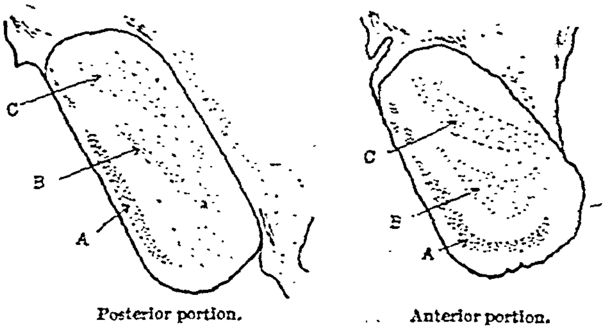
Reproduction of a drawing of the brain by Mr. Hamersley in the original post-mortem report (No. 2875). The tumour is largely hidden by the two swollen optic nerves.

Pathological examination.—The ventricles of the brain were slightly dilated and contained turbid fluid. At the base of the brain was a large gelatinous tumour which was in direct continuation with a somewhat enlarged pituitary body. The bone in the pituitary fossa is flattened out and partly absorbed. The tumour measured 1½ inches long by 1 inch broad and 1 inch thick. The optic commissure is stretched over it anteriorly, and the optic nerves, as seen in Fig. 10, are swollen up into two large swellings half an inch in diameter. Laterally and posteriorly the tumour is bounded by the crura cerebri. There was a patch of growth in the apex of the lower lobe of the left lung consisting of spindle cells arranged in loculi. Histologically the tumour showed a relatively large amount of fibrous stroma in which lay groups of cells, the majority of which were columnar in shape, a few being polyhedral. There was much mucinous material scattered through the section and several goblet cells were to be seen, which would suggest a possible origin from nasal mucous membrane. Its characters were those of a malignant columnar-celled growth. The secondary deposit present in the apex of the lower lobe of the left lung showed similar histological appearances.

The examination of the visual system of nerve fibres and cells.—The left side of the brain in Case 1 was sectioned and utilised for this purpose. A reference to Fig. 1 illustrating the fields of vision will show that the optic fibres destroyed by the tumour are confined to the nasal half of the retina—i.e., the temporal half of the field of vision. And, further, that a portion only of these fibres are affected. From this it might be expected that the degeneration present in the optic tracts would be extremely limited and circumscribed.

The optic tracts.—The accompanying drawings (Fig. 11) of the left optic tract, however, made from Weigert-Pal preparations, illustrate the condition actually found. A narrow band of fibres (A) occupying the outer portion of the tract alone stain normally. Two other bands of fibres (B) and (C) also stain, only less distinctly. The remainder of the tract is completely degenerated. The degenerated area can be described as occupying mainly the central and lower part of the tract. This agrees with Henschen's conclusions as to the position of the nasal fibres in the optic tract. The fibres which stain normally (A), however, which are from the temporal side of the retina, are found lying in the external and lower portion of the tract and not in the superior and external position which he describes.

FIG. 11.

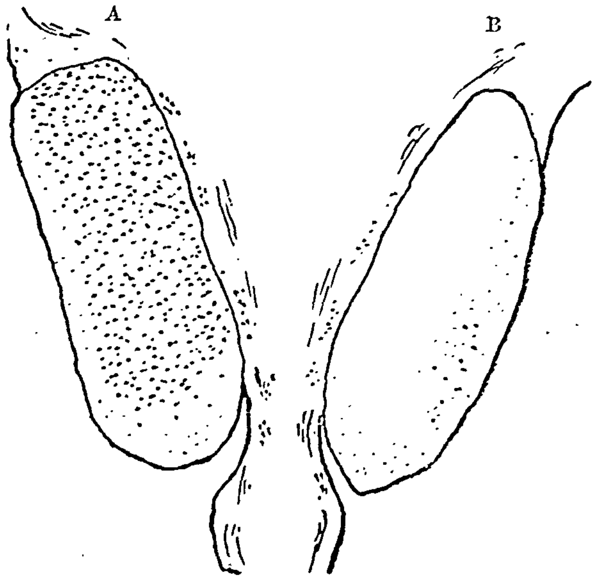


Posterior portion. Anterior portion.
Left optic tract, Case 1. Weigert-Pal preparation.

A comparison of the two drawings will further show that the relative position of the fibres remains approximately the same along the whole length of the tract. The first section is taken from the anterior part of the tract and the second from the region of the external geniculate body. Sections taken through the subthalamic region still showed the degeneration in the optic tract fibres as they entered the external geniculate body and the pulvinar. In this region no particular zone was degenerated; the affected fibres seemed to be scattered amongst those which stained normally. Preparations stained by Marchi's method show the presence of early degeneration amongst those fibres which stain normally with the Weigert-Pal method.

The cortical visual fibres.—Attention was next directed to the state of those fibres which after the relay of the optic tract fibres in the external geniculate body continue the visual impulses to the occipital cortex. No change could be demonstrated. The sections through the optic radiations, stained by Wiegert-Pal, were quite normal. Similarly, no change could be found in these fibres when traced to their termination in the cortex surrounding the calcarine fissure. Sections of this cortex were then stained by Nissl's method and the large stellate cells in the fourth layer—i.e., those concerned with the reception of the visual impulses—were examined. It cannot be said that there was any deficiency in the number of these cells or in their size. It was, however, found that a certain proportion of them exhibited chromatolytic changes, but this did not occur in any definite grouping.

FIG. 12.



Left (A) and right (B) optic tracts in Case 2. Weigert-Pal preparations.

The fibres concerned with the reaction of the pupils to light.—The presence of the hemiopic pupil suggested that this case might throw some light on the question of the course which these fibres take. Serial sections of the posterior thalamic region and the mid brain were accordingly cut and compared with normal preparations. The path described by Meynert—i.e., fibres running dorsally to the anterior corpora quadrigemina, relaying in these bodies and continuing by means of new fibres which end in the oculomotor nucleus—did not give any evidence of degeneration. Similarly, the investigation of the path described by Darkschiewitsch and Mendal—i.e., fibres running to the ganglia habenulæ and continuing by new fibres which reach the oculomotor nucleus *vid* the posterior commissure—also led to negative results. As, however, the majority of pupil fibres were unaffected in this case, and, further, that either theory states that the degenerated fibres end in cell relay stations in the neighbourhood of the primary optic ganglia, this result is not surprising.

In Case 2 the optic chiasma, although severely compressed, was not broken through as in Case I. Primary optic atrophy had been observed clinically in the left eye but not in the right. The condition of the optic tracts was as follows. The left optic tract was quite normal with the exception that a few degenerated fibres were found occupying its lower border. This area is indicated in Fig. 12. The right optic tract, on the other hand, was found to show marked degeneration very similar to that present in the other case. A band of fibres situated in the outer and lower part of the tract are seen to be unchanged, although even they do not take the stain as well as do perfectly normal fibres. The remainder of the tract is completely degenerated.

Conclusions.—The only change, therefore, which it has been possible to demonstrate in the visual fibres as a result of a lesion of the optic chiasma—which had caused eye symptoms in both cases for upwards of two years—is a degeneration in the optic tracts. This degeneration was not found extending further back than the primary optic ganglia. The amount of change present in one case was more than was indicated by the visual loss. The statement that certain optic fibres reach the occipital cortex without relaying in the cell stations in the primary optic ganglia would appear to be refuted by the fact that no degeneration was found in the optic radiations and the fibres entering the calcarine cortex. Finally, both cases show that the uncrossed visual fibres tend to occupy the outer and lower portion of the optic tracts.

REMOVAL OF A FOREIGN BODY FROM THE LARYNX BY SUSPENSION LARYNGOSCOPY.

BY DAN MCKENZIE, M.D. GLASG., F.R.C.S. EDIN.,
SURGEON, CENTRAL LONDON THROAT AND EAR HOSPITAL.

THE patient, a little girl aged 2 years, was sent to the Central London Throat and Ear Hospital on May 22nd, 1914, by Dr. A. G. Stewart, of Paddington Infirmary, on account of laryngeal obstruction. The history was that one day, four months previously, the child made a grab at a piece of rabbit on her mother's dinner-plate and tried to bolt it. The mass stuck and the child "choked." But a neighbour woman rushed to the rescue and promptly hooked the meat out of the child's throat with her finger and breathing was re-established. Not only so, but, according to the mother, the respiration was then quite free and unimpeded. Next morning, however, the mother noticed that the breathing had become loud and stertorous again and she thereupon took the child to a hospital where during the next three months she was treated as an out-patient for bronchitis. At about 10 o'clock one evening in the middle of April the patient had another severe attack of asphyxia and she was then taken to the Paddington Infirmary under Dr. Stewart's care. Here she did have genuine bronchitis, being laid up with it for about a month, and during this illness she was also for several days unable to swallow and had to be fed with a nasal tube. While in the infirmary a search was made for a foreign body in the larynx with X rays (screen examination), but nothing definite could be made out.

On May 22nd I saw the baby for the first time; the laryngeal stridor was audible several yards off, and each intake of breath was accompanied by considerable recession of the suprasternal and supraclavicular fossæ and of the lower sternal ribs. There was a complete absence of phonation but no cyanosis, and the baby seemed to be bearing her misfortunes with extraordinary calmness. That there must be a piece of rabbit bone in the larynx was abundantly evident from the history of the case and from the physical signs, and so the child was at once admitted to hospital, and next morning (May 23rd), Mr. Archer Ryland and Dr. H. Huff-Johnson assisting, tracheotomy was first of all performed, without any anæsthetic, and then recourse was had to the Killian suspension apparatus for the purpose of investigating the larynx. This procedure occupied about an hour, chiefly because of the difficulty of getting beyond a short pendent epiglottis which kept slipping away from the epiglottis retractors. And it was not until I abandoned these aids and used a long stout probe to hold up the epiglottis that I could get a view of the larynx beyond. Even then all that could be seen, as it happened, were two tiny arytenoid eminences and two puffy ventricular bands in almost constant apposition with each other. Once, indeed, I was able to catch a glimpse of a whitish substance in the larynx, but could not be sure that it was not simply mucus. Owing to the swelling of the interior of the larynx, and owing to the presence of the laryngeal reflex, the child not being under an anæsthetic, it was, in short, impossible to see whether a foreign body was present or not. However, fortified by the facts of the history, I determined to push my explorations. A pair of direct laryngeal forceps was passed open into the larynx and a cautious search made in the neighbourhood of the glottis. The first attempt drew blank, but on the second I had the satisfaction of feeling the jaws of the forceps close upon a hard substance which I rotated a little to loosen from its attachments and then successfully removed. It proved to be the piece of rabbit bone I had been looking for. The shape and dimensions of the foreign body are well shown in the accompanying illustration, and the impaction in the larynx is easily understood when one notes its sharply pointed shape.

The child did very well. The tracheotomy tube was removed a week later, after the laryngeal inflammatory obstruction had subsided, and the patient can now phonate after four months' silence.

The case is interesting for many reasons. First of all, the history showed that a foreign body had been left behind in the larynx after the plug of meat had been removed, and that it was causing recurrent attacks of laryngeal inflammation. Secondly, the case exemplifies the extraordinary tolerance of the air-passages to foreign bodies, as contrasted with the œsophagus. In this case the spicule of bone had been impacted in the larynx for four months. Lastly, we have here an instance of the successful application of suspension laryngoscopy. This, according to Professor Killian's remarks at the recent Semon lecture, makes only the fifth case so far recorded of a foreign body being removed with the aid of suspension laryngoscopy. The others were by E. D. Davis,[1] by Weingartner, by Seiffert, and by Iglauer.

With regard to the efficacy of the suspension method in this case the opinion formed by us at the operation was that by no other bloodless means could the larynx of so young a child have been exposed so fully. Indirect examination with the mirror in such cases is obviously *hors de concours*, and the only comparison to be made is with direct examination through the laryngeal tube spatula. Tubal examination would have revealed as much perhaps, but when it came to operation the manipulation of the direct forceps through the narrow infantile tube would have been very awkward and difficult, both because the space is restricted and because vision is necessarily monocular. By the suspension method, on the other hand, ample space was provided for the passage of instruments and that with the ease and confidence binocular vision always brings to the operator, for by this method not only can we work with both hands but we can see with both eyes. It is to be noted that the epiglottis elevators supplied with the apparatus proved, in this case, to be useless, and after the waste of much time and energy I had to give them up and to use instead a long stiff probe held in my left hand.

Another point worthy of attention is that, following Chevalier Jackson's practice, I operated on the child without an anæsthetic of any kind whatever, general or local, and the patient did not seem to object in the slightest. Even the tracheotomy evoked little or no protest, and during the greater part of the suspension period of the operation the patient slept quite peacefully.

Brook-street, W.

Reviews and Notices of Books.

Plague and Pestilence in Literature and Art.

By RAYMOND CRAWFURD, M.A., D.M. Oxon., F.R.C.P. Lond. Oxford: At the Clarendon Press. 1914. Pp. 223. Price 12*s.* 6*d.* net.

IN his admirable "Latin Literature" Dr. J. W. Mackail, speaking of Celsus, says: "It seems most reasonable to suppose that Celsus was one of a class which is not after all very uncommon—doctors of eminent knowledge and skill in their own art, who at the same time are men of wide culture and far ranging practical interests"; and we can confidently assign Dr. Crawfurd to this category, even though his knowledge is not so encyclopædic as that of Celsus, who, besides being learned in medicine, was recognised as an authority on agriculture and military tactics.

The substance of the work before us represents the FitzPatrick lectures delivered by Dr. Crawfurd in the year 1912, and deals with a subject full of interest from many points of view. Epidemics bring out both the best and the worst side of human nature. If on the one side may be set the devotion of attendants on the sick, of whom Lucretius speaks so pathetically (vi. 1243)—

> Optimus hoc leti genus ergo quisque subibat,

the heroism of clerics such as Mompesson, the rector of Eyam, and of his flock in the seventeenth century in England, or of Belzunce, Bishop of Marseilles, in the eighteenth, of physicians such as Hodges, and apothecaries such as Boghurst, in 1665; on the other may be set the defection of Galen during the Antonine plague A.D. 165–180, and of Sydenham and Morgagni some 1500 years later, and the outbreaks of cruelty and superstition which led to massacres even as late as 1771. The great pestilences worked such appalling damage that men's minds failed them for fear, and even the medicine of the time, such as it was, stood aghast, to quote Lucretius again (vi. 1177)—

> Mussabat tacito medicina timore.

Dr. Crawfurd discourses learnedly on the many epidemics of pestilence, beginning with the Iliadic plague. This epidemic was probably true plague and not typhus fever, for it is expressly mentioned as affecting the mules and dogs of the camp first. On the other hand, Dr. Crawfurd takes the view, giving his arguments at length in an appendix, that the great plague of Athens, described by Thucydides and later by Lucretius, was typhus fever.

The origin of pestilence was naturally enough ascribed in early times to the anger of the gods for sins, general or particular; thus in Homer the sin was the ravishing of Chryseis, daughter of the priest of Apollo, and in much later times, although the idea of divine anger had not altogether passed away, pestilence was considered to arise from earthquakes which liberated poisonous vapours, or from the dust thrown up by volcanic eruptions. Lucretius ascribed diseases to noxious particles carried in the mists and winds, and Varro, whom Dr. Crawfurd quotes on p. 61, attributed disease in animals to the presence of "animalia quaedam minuta, quae non possunt oculi consequi."

The origin of the great Antonine plague, according to the story related by Julius Capitolinus,[1] was that it was brought to Rome by the soldiers returning from the expedition to the East commanded by the Emperor L. Verus. Some of the troops broke into a temple of Apollo and destroyed a golden chest found therein. From this chest, "spiritus pestilens evasit, atque inde Parthos orbemque complesse." Capitolinus goes on to say that this outrage was not the fault of Verus but of Cassius, who sacked the city of Seleucia in defiance of a treaty, so that here again we see the idea of pestilence as a punishment for wrongdoing.

Ammianus Marcellinus (the reference is xxiii. 6, not xxiii. 7, as given in Dr. Crawfurd's book) tells practically the same story, except that he says that the pestilential vapour escaped from a hidden chamber which the soldiers broke open in the search for treasure. Vapours escaping from chinks in the earth or from caves were always suspected of producing evil results, and Ammianus, a little earlier in the chapter just mentioned, tells of a chasm in the earth in Assyria, close to the lake called Sosingiten, from which a "halitus letalis" escaped having an offensive smell that destroyed any animal standing near it. He mentions another place near Hierapolis in Phrygia from which a "noxius spiritus" came out, which injured all except eunuchs who came near, and he makes the curious comment, "Quod qua causa eveniat, rationibus physicis permittatur." Is it possible that this tradition is due to some connexion with the sterilising effects of radio-activity? Another story about pestilence being spread by an exhalation from a cave is given by Servius in his commentary on Aen. xi. 785, which is interesting on account of the way in which the plague was stayed—namely, by the affected tribe imitating wolves, i.e., living by plunder and foray. Dr. Crawfurd takes his readers through the ages with pestilence stalking over the earth, the great Byzantine plague which lasted for 52 years, beginning in Antioch in A.D. 540 and reaching Strasbourg in 591. Its presence in Rome in 590 gave rise to the dramatic vision of Pope Gregory, who saw the angel sheathing his flaming sword while standing on Hadrian's Mole, now the Castle of St. Angelo. In 680 another severe pestilence affected Rome, and it was in this one that Sebastian became the plague saint, which he has ever since remained. The other important plague saint in the West was St. Roche, and in the East St. Pantelmon, who naturally enough from her commerce with the East was also a favourite in Venice.

We have not space to follow Dr. Crawfurd all through his researches into the art and literature of pestilence, but his work is extremely interesting and admirably done. In one point we beg leave to differ with him, and that is where he says that the "Dances of Death," most of which date from the fifteenth century, were the descendants of the Etruscan and other funeral dances. These latter were joyful dances, while the fifteenth century Dance of Death was emblematic of the universal power of death and took the gloomy view. We fancy that Ruskin is near the truth in his opinion that the Dance of Death was the outcome of the unsettling of men's minds and the break up of the old faith at the Reformation.[2]

We offer our cordial thanks to Dr. Crawfurd for a delightfully written book.

Abhandlungen aus dem Gebiete der Geburtshilfe und Gynaekologie.

Herausgegeben von Professor Dr. W. TAUFFER, Director der Frauenklinik der Königl. Ung. Universität zu Budapest. Band II., Heft 2. Berlin: S. Karger. 1913. Pp. 417.

THE major part of this publication consists of a monograph by Dr. Scipiades, in which he considers in great detail and in a most painstaking manner the various complications which can occur in a case of pregnancy complicated by a myoma of the uterus. The monograph extends over some 375 pages, and the author discusses the subject very fully. He considers in turn pregnancy with a myoma of the uterus, labour under the same conditions, and lastly the puerperium. The first part of the monograph, published in 1912, dealt with the relation between myomata of the uterus and sterility.

There is a vast amount of information contained in this work and the author has expended immense labour in collecting cases and histories. If we consider only the simple question of the presence of symptoms in these cases we shall get some idea of the completeness of the work. The author concludes that 82·8 per cent. of patients pregnant with a myomatous uterus complain of symptoms, and that in some 91 per cent. the symptoms are due to the presence of the tumour. The most frequent complaint, occurring in some 34 per cent., is that of pain. The questions as to the nature of the onset of the pain, its course, its degree, its character and localisation, are all discussed in turn. The next most common complaint after that of pain is some alteration in the abdominal girth. In 28·5 per cent. of the cases the symptoms are due to interference with the functions of the neighbouring viscera, and in 7·6 per cent. there are constitutional changes directly due to the presence of the tumour itself. Every other possible complication that may occur in connexion with a fibroid tumour associated with pregnancy is discussed in the same thorough way. The author has summarised not only his own experience, but also all the information contained in the literature of the subject, and the result is a piece of work of much value.

[1] Vita Veri in Hist. August.

[2] Modern Painters, vol. v., cap. iv.

There is also an article by the same author on the operations of hebosteotomy and extraperitoneal Cæsarean section.

Leitfaden für das Embryologische Praktikum, und Grundriss der Entwicklungslehre des Menschen und der Wirbeltiere.

Von Professor Dr. ALBERT OPPEL. With 233 illustrations in the text. Jena: Gustav Fischer. 1914. Pp. 314. Price 9 marks.

THIS book forms a guide for the student and practitioner to the study of practical embryology. The first part deals with the general principles of the subject and the aim and methods of practical embryology. A consideration of evolution, epigenesis, development and growth, some factors influencing development, methods of obtaining embryological material, technique, and a description of various experiments which may influence development follow.

The second part of the book deals with the ovum and spermatozoon, fertilisation and segmentation, and the development of the three primary layers of ectoblast, mesoblast, and endoblast. There is also a very good account of the formation of the membranes and placenta. The third part forms a most interesting atlas of serial sections of the early stages of development in the embryo of the toad, frog, blind-worm, fowl, rabbit, pig, and man. The fourth part deals very clearly and well with the development of the various organs and tissues derived from the three primitive layers. A good index and glossary with a full bibliography complete a useful book.

Anæsthetics: Their Uses and Administration.

By DUDLEY W. BUXTON, M.D. Lond. Fifth edition, enlarged. London: H. K. Lewis. 1914. Pp. xiv.-477, with numerous illustrations. Price 10*s.* 6*d.* net.

THIS well-known text-book is brought thoroughly up to date in the present edition, and Dr. Dudley Buxton is to be congratulated on the production of a very complete and authoritative work. The references and footnotes show clearly how much labour has been expended in order that nothing might be overlooked which was worthy of note, and the author does not unduly press his own views as against those he quotes from other authorities. Thus his advocacy of the dosimetric administration of chloroform by the Vernon Harcourt inhaler, familiar to all students of anæsthetics, is not too prominently vaunted, and the simpler methods receive adequate consideration. Dr. Buxton still recommends, we notice, induction by gas and ether as a preliminary to chloroform and to open ether. Many anæsthetists hold that the use of a closed inhaler, even for a short time early in the administration, is detrimental to perfectly quiet respirations later on, at any rate in abdominal cases; but no doubt Dr. Buxton's experience leads him to prefer the quick induction, and his liking for giving oxygen with his anæsthetics probably enables him to counteract what might be the baneful influence of a "closed" induction.

The historical chapter in the book is very fully written, and includes an interesting account of the part that hypnotism has played in the evolution of anæsthetics, and in his medico-legal chapter the author discusses almost every conceivable question that could arise from the ethical or legal aspect of anæsthesia. The chapter on local analgesia of all kinds is particularly well illustrated with diagrammatic anatomical plates.

In a book of such high general excellence it is permissible to point the finger of criticism at any slight defect, and we would traverse the author's statement that "phthisical persons will take nitrous oxide and ether without detriment," even though it is qualified by the reservation "when the coexistent bronchitis is not severe." We believe that in such cases ether from a closed inhaler should be altogether avoided. Again, in the conduct of intranasal operations by means of nitrous oxide and ether when more than one application of ether is necessary, Dr. Buxton recommends waiting for return of consciousness before making the second application. We do not believe this to be the best practice, nor is it in accordance with the level continuity of anæsthesia that the author recommends elsewhere in his book.

Lectures on Dietetics.

By MAX EINHORN, M.D., Professor of Medicine at the New York Post-Graduate Medical School. London: H. K. Lewis. 1914. Pp. 156. Price 4*s.* net.

A GREAT physician, not long dead, used to say that the best book he knew on dietetics was the "Physiologie du Goût," and in these days of wordy conflict between food faddists and food theorists we might well be tempted to go back to Brillat-Savarin and learn the secrets of eighteenth century French gastronomy, derived largely from centuries of experience under the oldest civilisation in the world in the Far East.

The common sense of the old Gascon lawyer is reflected in these lectures. Addressed to graduates, they assume a sufficient knowledge of the chemistry and constituents of food and of the physiology of digestion. Plunging at once into the question of digestibility, Dr. Einhorn warns us that the time required for breaking up food in the stomach is no real guide, as in reality the main place for digestion is in the small intestine. We are no longer dependent on the observations of Beaumont on his case of gastric fistula, but have a far larger range of observation from lavage of the stomach after test meals, as practised by Leube and Penzoldt. Professor Einhorn would shock many by some of his dicta. In health he advises us not to be afraid of foods that are not easily digested, as the stomach and duodenum lose digestive capability if they are pampered too much. He considers it may be as disadvantageous to eat too slowly as to eat too fast, but this fault is rare. "Live sensibly, and have a good meal, and a little conversation with your meals," and have a wait between the courses; this is sound and pleasant advice.

In his chapter upon diet in acute disease the general advice given is interesting, for Professor Einhorn has the courage to discountenance low feeding, especially in enteric fever. But in his remarks on this disease he exhibits a deficient knowledge of its history and of Graves's position in the matter of "feeding fevers." When Graves propounded his aphorism he was not aware of the distinction between "typhoid" and "typhus," or that the former was an affection of the bowels; ulceration of Peyer's patches from the irritation of undigested masses of food was not known to the medical profession in 1843, when Graves's lectures were first published.

There are many excellent dietaries given, and an interesting chapter on the uses and methods of duodenal feeding concludes a volume which for sound judgment can be highly recommended.

Taschenbuch der Augenheilkunde für Ärzte und Studierende.

Von Dr. Curt Adam, Privat-docent für Augenheilkunde an der Universität, Berlin. Berlin und Wien: Urban und Schwarzenberg. 1914. Pp. 395. Price 8 marks.

The scope of this book is described in the introduction, where two "childishly easy methods of investigation of the greatest value" are described. These are the method of oblique illumination and that of transmitted light, or what is often called the distant direct method. It is expressly stated that only those diseases of the eye which can be diagnosed without the use of the ophthalmoscope are at all fully dealt with; there is, however, a short section on intraocular diseases.

The book is clearly intended primarily for general practitioners, but it will be found well worthy of study by ophthalmologists. Particularly useful for the latter are the 40 pages in which modern methods of general treatment are discussed. They give an excellent résumé of the diagnosis and treatment of syphilis and tuberculosis, and of the use of sera, radium, electricity, and so on. The "special" part on external diseases, iritis, glaucoma, and squint, though rather telegraphic in style, is characterised by the accuracy of its statements, the lucidity of the exposition, the emphasis of important diagnostic features, and the adequacy of its advice on treatment. Thirty pages are devoted to injuries of the eyes, and 20 pages to workmen's compensation. The regulations as to sight in the German and Austrian armies are given. Finally, there is a useful compendium of prescriptions. The book has been translated into English, French, Italian, Russian, and Spanish, and can be cordially recommended.

Medical and Sanatorium Benefit Regulations, &c.

Edited by J. Henry Lloyd for Charts, Limited. London: Sir Isaac Pitman and Sons, Limited. 1914. Pp. 232. Price 5s. net.

This is a volume containing the full text of the clauses in the Insurance Acts and in the Regulations made under them concerning medical and sanatorium benefits, together with the principal memoranda and circulars dealing with these subjects that have been issued by the Insurance Commissioners. A system of classification has been adopted which has for its object the rendering readily accessible of any information sought for by medical practitioners, druggists, members of Insurance Committees, and others, who in the course of their duties may have rapidly to look up some point in connexion with National Health Insurance. For this object four varieties of type are used, so that anyone who has once made himself familiar with the book may know at a glance whether the passage he is reading is part of a section of a statute, of a regulation or order of the Commissioners, of an explanatory memorandum, or of an editorial note.

The system of classification referred to above appears to fulfil its object adequately in keeping all the information likely to be required upon any subject within the group to which that subject naturally belongs. There are seven such groups, and on the page which contains a list of them each title is distinguished by a brightly coloured border, the colour being repeated on tabs so placed as to guide the reader to the commencement of each article. Such a method of arrangement has considerable merit. It is essentially a matter of charting, and familiarity with the chart is necessary before it can be made use of; but we have little doubt that anyone who has once learnt his way about in the volume under review will find it useful as a work of rapid reference. It will also be an advantage to him to have what there is concerning the subject which he wishes to study given in full without abbreviation or paraphrasing.

It is regrettable that the issue of regulations and memoranda relating to national insurance has been so rapid and constant that any collection of them, though complete when first issued, has been apt to become obsolete, necessitating continual noting up and additions. The early period of the working of the Insurance Acts is, however, now over, and the inconvenience referred to must necessarily be less in future than it has been hitherto.

The Science and Practice of Dental Surgery by Numerous Authors, with an Appendix on Dental Jurisprudence.

Edited by Norman G. Bennett, M.A., M.B. Camb., L.D.S. Eng. (Oxford Medical Publications.) London: Frowde and Hodder and Stoughton. 1914. Pp. 797, with 993 illustrations. Price £2 2s.

A treatise on any subject which is the combined work of many authors must necessarily have, as is admitted in the preface to this book, certain defects. The principal defect in this volume is that certain of the articles are contributed by authors showing a thorough grip of general pathology, while others are written by those who apparently do not possess that knowledge or, if they do, are unable to express it in their contributions. In certain of the articles the writing is clear and lucid; in others the meaning is often extremely ambiguous. Another defect is the unequal consideration given to the different subjects; for example, irregularities of the teeth are very fully treated, but the important questions of caries and chronic general periodontitis are not discussed in a manner commensurate with their great importance.

Recent advance in dental science has shown the relationship between dental sepsis and general disease, and the object of modern treatment in dentistry lies in the direction of avoiding methods likely to lead to sepsis. One is therefore surprised to find such a full account of crown and bridge work, and in the article dealing with the latter subject types of apparatus are illustrated which cannot fail to produce stagnation areas, forming foci of infection. We trust that the editor in the next edition will remedy this defect and allow the general scheme of the work to be in keeping with modern ideas. There is much, however, in the pages of this volume which is excellent, more particularly the section on the etiology of irregularities of the teeth, contributed by Mr. Norman Bennett, the various sections written by Mr. J. G. Turner, the article on odontomes by Mr. W. W. James, the chapter on the etiology of caries by Dr. J. Sim

Wallace, and the lucid exposition of oral sepsis and its effects by Dr. Stanley Colyer.

The printing and general "get-up" of the book are good, and a word of praise is due to Mr. Bennett for the able way in which he has carried out his task as editor. A useful bibliography is added to each chapter. The index is insufficient.

LIBRARY TABLE.

Plain Rules for the Use of Tuberculin. By R. ALLAN BENNETT, M.B. Lond., Physician in Charge, Devon County Council Tuberculosis Dispensary. Bristol: John Wright and Sons, Limited. 1914. Pp. 48. Price 2*s.* 6*d.*—The employment of tuberculin in the treatment of pulmonary tuberculosis still has many opponents, whilst other physicians are enthusiastic as to its benefits. We have no intention at the present time of discussing the various arguments which have been brought forward on either side, but the book now before us touches on some of the more important points, and for the most part we can endorse Dr. Bennett's views. We quite agree with him when he remarks that in estimating the value of any remedy it is first of all necessary to be sure that one is dealing with the particular disease against which the treatment is directed, and further we uphold his statement that the presence of tubercle bacilli is the only sure and certain sign of the existence of active tuberculosis in the patient. The deductions to be derived from the employment of tuberculin for diagnostic purposes are open to many serious fallacies; all that the "reactions" can prove is that the individual so tested has had at one time a tuberculous focus and that he possesses a certain acquired immunity to the disease. The series of cases described in this book illustrates the effect of tuberculin as it can be given to ordinary working-class out-patients. It thus illustrates what might be carried out in dispensaries under the National Insurance Act. The method adopted has been to give the tuberculin at intervals of from six to seven days, the doses being so graduated that focal reactions only are produced, general reactions being studiously avoided. This plan has commended itself to a large number of physicians. Details of technique are then given, which can be readily followed, the dosage being especially discussed. Dr. Bennett expresses himself in moderate terms, which commend themselves to the reader. We think, however, that some comments should have been made on rises of temperature due to auto-inoculation; unless recognised the occurrence of excessive auto-inoculation in a course of treatment with tuberculin may easily conduce to error. The author has succeeded in condensing a large amount of information into small space, without detracting from the directions necessary to the successful administration of tuberculin.

Communicable Diseases: an Analysis of the Laws and Regulations for the Control thereof in Force in the United States (Public Health Bulletin, No. 62). Prepared under the direction of the Surgeon-General, United States Public Health Service, by J. W. KERR, Assistant Surgeon-General, and A. A. MOLL, A.B. Washington: Government Printing Office. 1914. Pp. 699. Price, paper, 50 cents.—This Bulletin is intended as a sequel to Bulletin No. 54, which described the provisions governing health organisation in the United States. It is considered a conservative estimate that at least 25 per cent. of deaths occurring in the United States have communicable diseases as their direct or immediate cause. That implies over 3,000,000 cases of preventable diseases yearly, with 300,000 deaths. The history and present status of the Federal laws are first given, and are followed by a comparative account of the regulations in regard to infectious diseases in the various States under such heads as mode of investigation, quarantining, hospitals, disinfection, expenses, disease carriers, food, hotels and restaurants and so forth, travel, public assemblies, school inspection, jails and other public buildings, industries, penalties, &c. There is an appendix of court decisions on the subject. This occupies the first 261 pages. Pages 262 to 665 are taken up with the text of the Federal and State laws, while pp. 667 to the end (p. 699) are occupied by a very complete index. Those specially interested in infectious diseases, public health and school medical officers, and many others may find it a useful work of reference.

Principles of Property. By J. BOYD KINNEAR. London: Smith, Elder, and Co. 1914. Pp. 152. Price 1*s.* net.—At the present time it is good for all of us to understand the fundamental principles of the doctrine of private property whether as regards property in general or as regards property in land. The class which possesses property in land is an extraordinarily small one in comparison with the population of this country, but the possession of the land means so much to the country that all of us should know something about the rights of tenure in land, its values, and the payments entailed by its possession. On these things depends so much alike of our national income and of the potential wealth of our country. Mr. Boyd Kinnear, in a brief attempt to show the logical consequences of the principles as at present established, has managed to be extremely clear upon a very complicated and difficult subject, and the brevity with which he has been able to set out, for example, the arguments for and against the nationalisation of the land is wholly admirable. We recommend this little book to all our readers. It has nothing medical in it save that whatever concerns the *res publica* must deeply concern the medical profession, while we are certain that an acquaintance with the definitions of the nature of property and with the usual arguments as to its private and national ownership will be of value to medical men working at the political side of their calling, a number which has recently much increased.

Minimum Rates in the Chain-making Industry. By R. H. TAWNEY. London: G. Bell and Sons, Limited. 1914. Pp. 157. Price 1*s.* 6*d.* net.—This is the first volume of a series of books to be published under the Ratan Tata Charity Foundation in the University of London. It deals with the establishment of minimum rates in the chain-making industry under the Trade Board Act of 1909. The Ratan Tata Foundation was instituted in order to promote the study and further the knowledge of methods of preventing and relieving poverty and destitution. It conducts inquiries into wages and the cost of living, into methods of preventing and diminishing unemployment, and into measures affecting the health and well-being of workers and kindred matters. The results of its researches in connexion with the chain-making industry given in this small book are very interesting. From the experience categorised in the volume Mr. Tawney submits that the Chain Trade Board has proved that it is possible to fix and enforce minimum rates of payment for a highly technical industry, and to do so with the approval of public opinion and of all the main classes of persons concerned in the trade. We must not make too large deductions from a very special set of instances, but the conclusion is a highly significant one. The monograph is well done and will decide many readers to purchase both it and its promised sequels, the first of which, on the feeding of school children, has already appeared.

MISCELLANEOUS VOLUMES.

OUR miscellaneous volumes this week are so miscellaneous as hardly to admit of any grouping.

Geology, apart from its scientific interest, has much to commend it as a means of recreation, inasmuch as it is for the most part an "open-air" science; and while its serious study is hardly to be thought of by the majority of busy medical men, still a desultory interest in it has advantages. An important division of geology is that of fossils. Those of the northern hemisphere are already well represented in many excellent text-books, but those of the southern hemisphere have perhaps not received in any one text-book the attention which they certainly deserve, the literature concerning them being widely scattered in various scientific publications, as is pointed out by Professor E. W. Skeats, of the Melbourne University, in an introduction to *Australasian Fossils: A Student's Manual of Palæontology*, by FREDERICK CHAPMAN, Palæontologist to the National Museum of Melbourne (Melbourne, Sydney, Adelaide, Brisbane, and London: George Robertson and Co. 1914. Pp. 341). This deficiency the author has now remedied. Part I. of the book deals with general principles, while in Part II. we have a systematic arrangement according to geological epochs of the fossils of Australasia in a series of chapters, each of which is followed by a list of the characteristic fossils described therein and a bibliography of the literature of the division dealt with. The many well-produced illustrations make the volume an admirable guide to the identification of specimens, while an appendix contains some useful notes on collecting and preserving fossils. A good index completes an excellent manual for students and others who desire a guide to the literature of the subject.

The Voluntary Service Committee and the National Service League are opposing teams in the "tug of war" in which our national defence is the rope. In the *Case for Voluntary Service* (London: P. S. King and Son. Pp. 200. Price 1*s.* net) the problem is first considered in its political and social aspect, and the needs and provision of our imperial military policy are considered. Then follows a comparison of voluntary and compulsory armies, a discussion on the Territorial Force and the particular problem of home defence. Various existing compulsory schemes are examined, the National Service League's army estimates are adversely criticised, and the conclusion is arrived at that compulsory service would entail a triple burden in the necessity for an increased, not a diminished, fleet, the compulsory home army, and a voluntary professional army for over-seas purposes.

Life in an Indian Outpost, by Major GORDON CASSERLY (London: T. Werner Laurie, Limited. 1914. Pp. 320. Price 12*s.* 6*d.* net), is a well-written and entertaining account of the life of a European officer in India, away from the sealed-pattern business of an ordinary plains station. The particular spot was Buxa Duar in the native state of Cooch Behar, whose enlightened ruler was a well-known figure in English society at home, as well as all over India. The duties, pleasures, work, and sport are described unaffectedly, and the reader gets a clear idea of the realities of Indian life. The book is well illustrated with photographs, apparently by the author.

There are, as is well known, at least two sides to every question. In the *Dictators of Mexico* (London: Effingham Wilson. 1914. Pp. 218. Price 2*s.* 6*d.* net) Mr. JOHN DE KAY gives us the views and experience of one who has been in close business relation with the rulers of Mexico for 15 years. Mr. de Kay goes to the root of the problems of Mexico. He gives a very fair, yet sympathetic, appreciation of the characters of both Diaz and Huerta—the last named of whom would appear to be by no means so black as he is painted. Here he is described as a plain, simple, rugged, and honest man possessing many virtues and some vices, severe and courageous, a stoic who daily takes his life in his hands. The so-called "Constitutionalists" are described as self-seekers and mere bandits. Mr. de Kay especially denies the stories told about Huerta's personal habits, and particularly gives the lie direct from personal knowledge—he spent the five months from September, 1913, to January, 1914, in close contact with Huerta—to the calumnies so widely disseminated concerning the latter's private house at Popotla. All interested in Mexico or in the present situation there should read this book; particularly it will confirm the opinion of our Ambassador in Mexico, a presumably competent judge, who, in justification of Great Britain's recognition of Huerta, described him as the only discernible man capable of restoring a more stable condition in that distressful land of vast opportunities and unfulfilled promises.

In THE LANCET of Dec. 23rd, 1911, p. 1779, we noticed two volumes by GLADYS DAVIDSON detailing the plots of 200 operas. The same author now offers us *Stories from Wagner's Operas* (London: T. Werner Laurie. Pp. 106. Price 1*s.* net), told at greater length than the brief summaries such as are included in the former volumes. The operas now told in story are the *Flying Dutchman*, *Tannhäuser*, *Lohengrin*, *Tristan and Isolde*, *Die Meistersinger*, *Der Ring der Niebelungen* (viz., *Das Rheingold*, *Die Walküre*, *Siegfried*, *Die Götterdämmerung*), and *Parsifal*.

Two reference handbooks call for notice. A useful one, both to the inhabitants of London and to visitors to the metropolis is the *Social Guide, 1914*, edited by Mrs. HUGH ADAMS and EDITH A. BROWNE (London: Adam and Charles Black. Pp. 264. Price 3*s.* 6*d.*). Preceded by a calendar of events is a comprehensive account arranged in alphabetical order of the various social amusements and entertainments in which society is interested, and, in addition, there has been included this year special information regarding various travel centres in all parts of the world. The mode of gaining admission to different functions and the dress appropriate to them are not overlooked.——*The Directory of Women Teachers and Other Women Connected with Higher and Secondary Education, 1914* (London: The Year Book Press, 31, Museum-street, W.C. Pp. 152. Price 7*s.* 6*d.* net), has increased in bulk owing to the large number of names which have been added to the directory this year. The second portion of the book is devoted to general information, commencing with a chronicle of the year and giving details with regard to appointments, degrees, educational societies and organisations, administration of secondary education, literature of the year regarding education, and so forth; while the third portion is occupied by a list of secondary schools for girls and university and training colleges. The utility of the book is marred by the fact that in the list of secondary schools fees and other useful particulars are omitted in many instances.

FIRE PREVENTION.—In this country the British Fire Prevention Committee have rendered useful service in many directions, and their work has been much appreciated by those who have charge of hospitals and other large institutions. It was on the initiative of this committee that the International Fire Service Council held its meetings at the end of June in London, when representatives of European and American fire brigades were present. The King sent the council His Majesty's good wishes. Earl Beauchamp, in welcoming the visitors on behalf of the Government, dwelt on the importance of the work done by the International Fire Service Council and by the British Fire Prevention Committee. Among the important questions discussed were fires on board ship, celluloid dangers, petroleum dangers, and the formation of county motor fire brigades. A meeting of the council will be held next year in Copenhagen, and in the meantime it has been decided to issue an International Fire Dictionary in three languages. This is a case where it seems to us an international language would serve a useful purpose in a fourth version, and Esperanto has already been used with success in ambulance exercises.

THE LANCET LABORATORY.

COLLOTHIOL PREPARATIONS.

(AGENCY: F. H. MERTENS, 64, HOLBORN VIADUCT, LONDON, E.C.)

THESE interesting preparations of sulphur in a colloidal form are products of the Clin Laboratories in Paris. There is good reason for believing that sulphur in the colloidal form is considerably more active than sulphur in the ordinary form. The elixir collothiol is prescribed in diseases of the respiratory tract, particularly where there is secretory disturbance. It is also used in rheumatoid arthritis, while it is a useful antidote to lead poisoning since it readily converts lead compounds into the insoluble sulphide. Elixir collothiol is a pale yellowish fluid practically neutral in reaction. A drop of the elixir placed on a silver coin readily blackens it on warming. The elixir has a slightly saline taste. On evaporation ordinary sulphur separates and remains as a resinous mass. The elixir is clear but shows an immense number of mobile particles when examined with the ultramicroscope. Collothiol is also present in a pomade, an oily paste contained in a collapsible tube. It provides a powerful means for applying sulphur externally.

"VAPOROLE" NUCLEIN.

(MESSRS. BURROUGHS WELLCOME AND CO., SNOW HILL BUILDINGS, LONDON, E.C.)

The hypodermic injection of pure sterilised nuclein has attracted attention recently in connexion with its action in increasing the bodily resistance to bacterial invasion. It is recorded that these injections stimulate leucocyte formation and raise the opsonic index. The preparation has thus been employed in bacterial infections generally. The "vaporole" presents a convenient form for administering a definite quantity of the sterile solution of nuclein, the nuclein itself being derived from yeast cells. The preparation has also been reported on favourably in the treatment of alimentary toxæmia, in nervous prostration, and in disorders of nutrition.

POTATO EXTRACT PREPARATIONS.

(MESSRS. BAISS BROTHERS AND STEVENSSON, LIMITED, 174, GRANGE-ROAD, BERMONDSEY, LONDON, S.E.)

The treatment of rheumatism, gout, lumbago, synovitis, and so forth, by potato juice was described in a paper in THE LANCET of April 11th, 1914, by Mr. Heaton C. Howard. Potato juice is now supplied in two pharmaceutical forms—namely, ext. solani liq. and ung. solani. The extract is a dark brown fluid smelling of aromatics and distinctly also of the potato. We found that it rapidly reduces alkaline copper solution and it also produces a beautiful silver mirror when heated with alkaline silver solution. It gives further a precipitate with calcium chloride when the mixture is heated, a part of which dissolves on allowing the fluid to cool. Potassium salts are present in considerable quantities, and probably in the form of citrates or tartrates, or both. Alkaloid reagents gave negative results. Iodine and bromine were without effect. The preparations are interesting and will no doubt receive further trial.

SEDOBROL.

(THE HOFFMANN-LA ROCHE CHEMICAL WORKS, LIMITED, 7 AND 8, IDOL-LANE, LONDON, E.C.)

This combination presents sodium bromide in an appetising bouillon basis. Sedobrol consists of yellowish tablets which are practically completely soluble in warm water, but there is a separation of a distinct quantity of fat. The solution has the pleasant flavour of meat bouillon, but the bases are said to be of vegetable origin. We found that only a small precipitation occurred with bromine indicating the presence of a small quantity of nutrient, but on adding alkaline hypobromite there was marked effervescence of nitrogen gas due to nitrogenous bases. The presence and amount of bromine was confirmed, each tablet containing 17 grains of sodium bromide. In spite of there being only a trace of common salt present the flavour of the bouillon is pleasantly saline. The claims made in regard to sedobrol are: (1) that free dilution is ensured, which together with the presence of the stimulating vegetable extractives obviates gastric disturbances; (2) that by its medium bromide may be given in the form of a dietetic, the patient being unaware of the presence of the drug; and (3) that it enables the physician to give bromide while gradually withdrawing the daily intake of sodium chloride, which can be done without rendering the diet insipid. Clinical examples are given of the advantages of this means of administering bromides. Of course, it is highly desirable in the interest of the patient that sedobrol should be exclusively supplied by the physician and the treatment carried out under his observation.

PLASMON OAT FOOD.

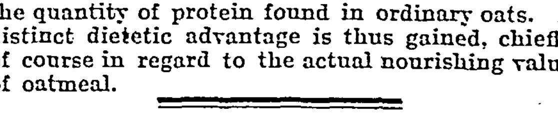
(INTERNATIONAL PLASMON, LIMITED, 66A, FARRINGDON-STREET, LONDON, E.C.)

On a previous occasion we reported upon plasmon rolled oats, but there has now been introduced a finely ground preparation known as plasmon oat food. The statement that there is added 10 per cent. of plasmon to the oat flour is confirmed by our analysis, since we found that the total protein amounted to 23·37 per cent., which is about double the quantity of protein found in ordinary oats. A distinct dietetic advantage is thus gained, chiefly of course in regard to the actual nourishing value of oatmeal.

New Inventions.

A NEW ARCHIMEDEAN DRILL.

I HAVE found the all-metal archimedean drill shown in the illustration much more satisfactory than other mechanical drills for making the screw-holes in plating fractures. The flanged wheel which drives the drill gives a comfortable grip for thumb and finger or hand, and can be held lightly without slipping when wearing rubber gloves.



As the pressure on the bone can be nicely regulated, there is much less risk of breaking the drill points than when using a drill worked by turning a handle. It will be found that time is saved and fatigue lessened by this instrument.

The drill has been made for me by Messrs. Allen and Hanburys, Limited, of Wigmore-street, London. W.

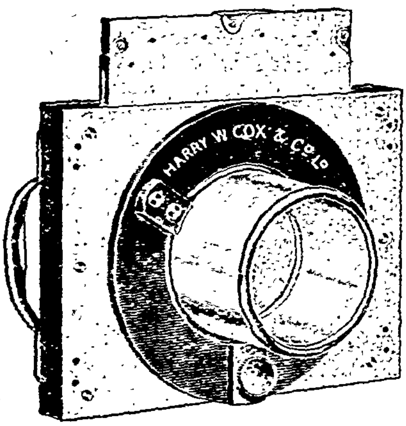
Bolton.

AN X RAY SCREEN COMPRESSOR FOR THE DETECTION OF URINARY CALCULUS.



THIS is a small and extremely useful piece of X ray apparatus. It consists, as is shown in the illustration, of a short, blunt nozzle of lead glass, above which is fixed a piece of fluorescent screen. Between these is a small gap into which slides a cassete, or plate holder (half plate), containing an intensifying screen of tungstate of calcium. By means of two handles the operator can press the nozzle into the patient's abdomen and thus obtain an extremely bright view of a small area. He is able to explore renal and bladder regions, also to examine more closely supposed kinks and other intestinal conditions after the administration of bismuth. Any discovery he may make can be recorded by instantaneous exposure on the half plate which, in its casette, is placed in the opening below the screen while the exposure is made. Small calculi have been detected with this little instrument that would have evaded the more usual methods of X ray examination. In the last 310 cases of suspected urinary calculus examined by my colleague, Mr. H. M. Eccles, and myself at Guy's Hospital, 68 calculi were discovered, and in every case they were seen upon the screen prior to being photographed. This small screen compressor added materially to the successful detection of these stones.

Messrs. Harry Cox and Co., Limited, 47, Gray's Inn-road, W.C., have made the apparatus to my design.

EDWARD W. H. SHENTON, M.R.C.S. Eng.,

Harley-street. W. Senior Radiographer, Guy's Hospital, S.E.

MEDICO-LEGAL SOCIETY.

Discussion on Incipient Insanity.

AT the conclusion of the annual meeting of this society, held on June 30th at the rooms of the Medical Society of London, a discussion took place on Incipient Insanity, with particular reference to a Bill bearing upon this matter soon to be introduced into the House of Lords. The Bill has been drafted by the Medico-Legal Society, in consultation with the British Medical Association and the Medico-Psychological Association. It proposes to legalise the giving of medical treatment in the early stages of mental disease (subject to the consent of the patient), notwithstanding the provisions of Section 315 of the Lunacy Act, 1890, which make it illegal to exercise restraint over a person who is not a certified lunatic. The authority for treatment in an incipient case—which may be given in an approved house—for example, a mental hospital, general hospital, or private house or institution—is a declaration by a medical practitioner that the patient is suffering from incipient mental disease and is not suitable for certification as a lunatic or defective under the Mental Deficiency Act, 1913.

The PRESIDENT (Earl Russell) said the Bill was intended to deal with the circumstance that it was a very dangerous thing for a medical practitioner or anyone else to treat a person on the borderline of insanity. Anyone doing so was constantly running the risk of prosecution under Section 315 of the Lunacy Act, and the result was, they were assured by medical practitioners, that persons who might be saved from becoming actively insane, if treated in time, often were not treated because of this fear of prosecution. They were allowed to go from bad to worse until they reached a certifiable stage and might be brought under the Lunacy Act and properly treated. The Bill was a voluntary one; no person could be detained against his will. The Bill might be a better one if it were compulsory, but it would then have no chance of passing.

Dr. ROBERT ARMSTRONG-JONES, in opening the discussion, said that the whole object of the Bill was to avoid the stigma of certification. Mental disease was of all diseases the most curable in the early stages, but it was one of the most expensive and difficult to cure when rooted in any family. The Bill would make it possible for rich and poor to be treated outside the gates of an asylum; the potentially insane would be saved from the damning certificate. Dr. Armstrong-Jones mentioned that the Bill had the sympathy of the Board of Control under the Mental Deficiency Act.

Dr. FRED. J. SMITH said he wished to raise what was perhaps an academic point—Was there such a thing as incipient insanity? Was it not a condition which had been there practically from birth, though not exhibiting itself at first? He preferred the term used in the Bill, "mental disease of recent origin." For persons whose condition did not warrant compulsory detention the Bill would be an admirable one. The question arose whether a patient would realise his condition and submit himself voluntarily to treatment; such patients usually resented the idea that it was necessary they should be taken care of.

Dr. F. G. CROOKSHANK thought that without casting stones at the general practitioner there was a danger that under pressure the general practitioner would apply this Bill to persons who should be certified: that might be met by including in the declaration to be signed by the doctor the definite statement that the case was not suitable for certification. He foresaw difficulties because the declaration in effect authorised another practitioner to receive a patient and give treatment.

The PRESIDENT pointed out that the authority given by a medical practitioner was not necessarily to another practitioner, but to an approved person. It was felt desirable not to use the word "certificate," so that the patient could not be said to have been certified in any sense. The operation of the Bill would be under the direction of the Board of Control, whose inspectors would deal with cases which it was thought should be certified.

Mr. C. WOODWARD thought puerperal insanity a bad instance to choose for the purposes of the Bill, such persons were absolutely insane at the moment.

Dr. JAMES SCOTT (Holloway Prison) thought the Bill should deal with adolescent cases; in their case the stigma of insanity was a very real thing.

Dr. BERNARD H. SPILSBURY asked what would be gained by the Bill, seeing that it was already possible for a patient to give his consent to voluntary treatment. He thought refusals to undergo treatment would be frequent.

The PRESIDENT replied that the main object of the Bill was to avoid a prosecution of the medical practitioner under Section 315, but although the measure was a voluntary one there was no necessity for a formal consent to treatment. It was proposed to ask Lord Loreburn to introduce the Bill in the House of Lords, to explain its objects, and cause it to be read a first time. The Bill could not get any further this session, but it was thought useful to place it before the public.

Mr. ROLAND BURROWS, LL.D., in closing the discussion, said that care had been taken to eliminate from the Bill any term used in the Lunacy Act whose nomenclature had acquired a sinister meaning. The Bill declared, what was intended to be declared under the Lunacy Act, that if a person was not certifiable he could be treated. It was proposed that this should be done under proper conditions and without embarrassment to those in charge. The aspect of voluntary treatment had been over-emphasised in the Bill for the express purpose of allaying apprehension by the public. The Bill was based on a Government measure introduced in 1905, presumably with the approval of the Lunacy Commissioners. The Bill laid down no rule as to treatment; it merely provided that a person in whose custody a sufferer was should not be liable to be prosecuted. The form of treatment was a matter for a medical attendant. As to the definition of incipient insanity, he felt that the psychiatrists deserved criticism because they had not agreed amongst themselves what were the standards of sanity or insanity. The law had no regard to anything but objective symptoms.

THE LANCET.

LONDON: SATURDAY, JULY 4, 1914.

The Working of the National Insurance Act.

IN a recent article in the *Nineteenth Century and After*, advocating the establishment of a National Medical Service, Dr. W. A. BREND finds that the medical treatment available for the poor "neither covers the whole field nor is always of satisfactory quality." To obviate this and other defects Dr. BREND suggests the establishment of a salaried medical service, with local centres for medical treatment. In a town of, say, 20,000 inhabitants one centrally placed building would suffice for the assembling of patients for clinical purposes, the number of such buildings increasing proportionately to the population. This building, in his idea, would contain two or three consulting-rooms and waiting-rooms and a small theatre for minor operations. In larger clinics, or in the central one of a group, there should be in addition an X ray apparatus and a clinical pathological laboratory. The entire district should be divided into areas, and one salaried medical officer should be told off to do all the house visiting for each area, all consultation work being done at the clinic when the patient was in a position to attend. Each clinic, he considers, should command the services of from five to eight whole-time salaried general practitioners who should work in pairs by turns, at morning and evening hours, and should have the assistance of nurses as well as of specialists. There should be a chief medical officer to each clinic, with principal medical officers in all large towns and counties, and a central administrative staff. The officers of the clinical staff should be chosen persons, and ultimately a State diploma should be instituted. Dr. BREND cites the experience of the Great Western Railway at Swindon, where a scheme of something of this kind works well for 43,000 persons, and his views here are in accord with those of many who see no necessity for the institution of a State Medical Service. In small towns the cottage hospital and its staff might well develop into a clinical centre without any profound professional revolution. In larger towns coördination of the clinical centres with the hospitals might then be effected, and the latter institutions, relieved of trivial cases, would devote their energies, space, and funds to consulting and special work, and do so upon the existing voluntary system.

The advantages of a State Medical Service to the profession as a body should lie in greater leisure for keeping abreast of new knowledge, opportunity for post-graduate study and research work, regular hours and holidays, and certainty of income; but the drawbacks are as obvious as the advantages. Dr. BREND admits the danger that such a scheme might convert the practitioner into an official machine, and the time-honoured objection that it would preclude the public from the free choice of a doctor has to be got over. The amalgamation or coördination of all services at present having medical functions, culminating in the ultimate establishment of a Ministry of Health, is foreshadowed in all such suggestions for root and branch alteration of existing methods. We cordially agree with Sir CLIFFORD ALLBUTT in his advocacy, repeated this week to the Medical School of St. Thomas's Hospital, of a Ministry of Health, but this can be instituted without any deliberate transformation of medical men into a State Service. In considering the establishment of a State Medical Service as a panacea for the medico-economic ills of the public and the profession it may not be unfair to recall the fact that Dr. BREND was one of the optimistic supporters of the Insurance Act before it became law, as the columns of THE LANCET witness. But every one of the admitted defects of the Act, now brought to light as the result of experience of its working, was as a matter of fact insistently pointed out beforehand in these columns as probable. We refer to such defects, now confessed by everyone, as that the faulty conditions of club practice have reasserted themselves in panel work; that the bulk of the insurance work, instead of being evenly distributed, tends to fall into the hands of relatively few practitioners, so that many undertake more than they can adequately perform; that a cleavage has arisen in the profession between panel and non-panel doctors, tending towards the creation of rich men's and poor men's doctors; that the amount of sickness is suspiciously high in many places; that the pecuniary strain on hospitals has been increased; and that over-pressure has occurred among medical men.

We publish this week the last of a series of articles by our Special Commissioner, who has been giving a bird's-eye view of the working of the National Insurance Act during the early stages of its existence. The object of the articles has been to describe typical conditions in places geographically separated, as well as distinct in many of their main characteristics, some being large manufacturing towns, some country centres, some places where wages ruled high, some where poverty was a distinct feature, some where the feeling of the community was dead against legislation of the pattern to which the National Insurance Act belongs, and some where the Act was welcomed by many as an outward expression of their political creed. From the variety of experiences which our Commissioner has recorded there emerge certain definite lessons which do *not* in our opinion support the claim for the immediate institution of a State Medical Service, though they supply the reasons for what is, we think, an increasing advocacy of this revolution among medical men. To begin with, it is perfectly clear that the working of the National Insurance Act, as far as the administration of medical benefit goes, is only partially satisfactory. A certain number of medical men have benefited pecuniarily by the new legislation and in many places the standard of contract practice has been improved, but in other places the old conditions of club practice seem to be persisting unchanged. But as the public, which is thus inadequately served, is not so ignorant as it used to be, considerable resentment may be expected. As yet the administration of the Act appears to be cumbersome and expensive, and we anticipate considerable modifications before smooth working is established, though we cannot call with the same conviction that Dr. BREND does for the institution of a State Medical Service. The scheme of a National Medical Service, before it can attain any enthusiastic support at the hands of the profession, demands more unbiased and less impulsive consideration than was accorded to the Insurance Act, which it is hardly likely to get under the ægis of any political sponsorship.

◆

The Pituitary Body in Health and Disease.

THE evolution of our knowledge in regard to the functions of the various parts of the pituitary body, and the effects of their derangement in disease, affords one of the most interesting chapters in modern experimental medicine. This structure regarded for long as of little importance, if not actually vestigial in character, practically first received serious recognition from the acute observations of MARIE in 1886 in regard to acromegaly. Even after them, however, but little attention was paid to the possible activities of the pituitary body until the impetus given to the investigation of the ductless glands by the discovery of the internal secretions associated with some of them. Since the beginning of the present century a considerable literature, both on the experimental and clinico-pathological aspects of the pituitary functions, has arisen, and as a consequence our nosology has been increased by the differentiation of certain clearly defined diseases, and our therapeutics enriched by a valuable and powerful agent—pituitary extract.

The anatomy and histology of the gland have been studied with great care and with practical result. Clearly it consists of two portions, of different embryological origin, an anterior glandular lobe, derived from the pouch of Rathke, and a posterior or nervous lobe formed from a downgrowth of the neuroblast of the mid-brain. The glandular portion is divided into two—the pars anterior proper, which is by far the larger, and a smaller paler zone, called the pars intermedia, which forms an investment to the posterior lobe, from which it cannot be separated. It is also worthy of note that embryonic "rests" of hypophysial tissue are frequently to be found in the pharynx and base of the skull, which may possibly assist in carrying on the activities of the pituitary body, when it is diseased or injured in experiment. The complex relationship of the two parts of the gland to one another has rendered the actual differentiation of the special functions of each a matter of great difficulty, and even at the present time it can hardly be said to be complete. It appears to be definitely established that the anterior lobe is essential to life, since its complete removal results in death preceded by a train of symptoms to which the name of cachexia hypophysiopriva has been applied. Partial removal or disease of this structure results, according to CROWE, HARVEY CUSHING, and HOMANS, in a peculiar state of adiposity, with persistent infantilism in young animals or with retrogressive changes in the generative organs in adults. Conditions of polyuria, glycosuria, hypotrichosis, and œdema of the skin, with subnormal temperature and mental changes, are also common. Ablation experiments indicate that the posterior lobe is less essential to life, but show that it plays an important part in the utilisation of sugar in the organism, since after its removal a temporary lowering in the tolerance for sugars is followed by a lasting increase The study of extracts of the gland, first started by SCHÄFER and OLIVER in 1895, has yielded the surprising result that it is from the posterior lobe, with its smaller and relatively simple and indifferent structure, that the active extracts are obtained. The separation of pituitrin and the discovery of its important effects in raising blood pressure, slowing the pulse, inducing diuresis, stimulating the mammary glands, and increasing uterine contractions are now matters of common knowledge and experience. It is generally supposed that the active substance is elaborated in the pars intermedia, and it is suggested by HERRING that it passes into the posterior lobe and thence into the ventricles of the brain. As in the case of the other glands with internal secretions, it would appear that disturbances of the functions of the pituitary body may lead to associated alterations in other secretory structures, and some authorities have endeavoured to establish polyglandular syndromes as a result. It is clear that the pituitary body and the testes and ovaries are intimately associated, and histological changes in the interstitial cells of Leydig in the testes have been demonstrated after partial hypophysectomy. There is a good deal of evidence that the thyroid gland and the pituitary act synergically, and that each may to some extent act vicariously for the other, as Dr. R. G. HOSKINS has rather happily expressed it.

The results of disease of the pituitary body are, as might have been anticipated from its complex structure and important functions, of varying and far-reaching character. At first, on the analogy of thyroid disease, it was customary to differentiate conditions of over-activity or hyperpituitarism and those characterised by defective function or hypopituitarism. It soon became clear, however, that there were conditions which did not fall into either of these groups, owing to the fact that one part of the pituitary may be alone involved, or that by enlargement with over-activity it may interfere with the functions of the other part. For such conditions the term of dyspituitarism has been introduced. The matter is complicated, as has been so brilliantly demonstrated by Harvey Cushing and his co-workers, by what have been referred to as "neighbourhood symptoms"—that is, by the effects of increased intracranial pressure, and by the secondary effects upon other glandular structures. We publish in this week's issue of The Lancet two interesting papers which illustrate the complexity and importance of pituitary disease and indicate that some of its forms may be less uncommon than is generally supposed. Dr. E. G. Fearnsides gives details of a dozen cases which have come under his notice, and the tables which are appended to his paper afford a valuable record of the varied symptoms which he has investigated in order to establish the diagnosis of pituitary disease. It will be seen from these that he has carefully examined the patients for those symptoms which might be expected to be present in derangements of the pituitary body in the light of our knowledge of its functions from physiological experiments. Consequently these tables are of considerable interest, although they are secondary to the main thesis of the paper, which is to establish the effects of pituitary disease upon the shape of the sella turcica and the diagnostic value of X ray examination of the base of the skull. Dr. Fearnsides concludes that in doubtful cases a change in the size or shape of the sella turcica, as seen in the X ray plate, is at present the most certain evidence of pituitary disorder, and for this purpose he states the actual measurements of the pituitary fossa as given by Professor Arthur Keith, and the measurements in profile radiograms which may be regarded as abnormal according to Professor Harvey Cushing. The second paper is that by Dr. W. Johnson on a pathological investigation of four cases of pituitary tumour observed at Guy's Hospital. All four of these cases appear to have been cases of primary malignant disease of the pituitary body, and in only one was there any secondary growth. The growths presented peculiar and somewhat characteristic features, and were in most of the cases cystic. In one of them the ocular condition and the fields of vision were most carefully investigated by Mr. H. L. Eason, who has described the case fully in an interesting clinical lecture published in the *Guy's Hospital Gazette* of June 20th. There was complete temporal hemianopia, which occurs so frequently in pituitary tumours from the pressure of the growth upon the central part of the optic chiasma. Reproductions of the perimeter charts are given with Dr. Johnson's paper.

It not infrequently happens that the detailed examination of a pathological condition by skilled observers throws light upon physiological conditions. The particular case of Dr. Johnson to which we have just referred affords an instance in illustration. The growth occupied the interpeduncular space completely and had broken through the optic chiasma in such a way that the right and left optic nerves appeared to be the direct continuations of their respective tracts—in other words, the fibres crossing at the chiasma were broken through. Fortunately, Mr. Eason's observations were available to show that the temporal halves of the fields of vision corresponding to the nasal halves of the two retinæ were affected. Dr. Johnson availed himself of the opportunity offered of tracing the visual fibres backwards into the brain by studying the degenerations present. He found that the uncrossed fibres—that is, those that were not degenerated—occupied the outer and lower portions of the optic tract. This he confirmed by examination of one of the other cases. He also found that the degeneration was confined to the optic tract and ceased at the primary optic ganglia in the external geniculate body and the pulvinar. No degeneration could be discovered in the optic radiations or in fibres entering the calcarine cortex, thus negativing the statement that has been made that certain fibres pass directly to the occipital cortex without relays in the primary optic ganglia. We can commend both these papers to our readers as interesting, instructive, and suggestive.

The Dogs Protection Bill.

The Bill to prohibit the vivisection of dogs has been recently made prominent. The cause of much bickering and manœuvring in committee, its deliberation has incidentally led to complications involving questions of Parliamentary procedure and practice, and on Tuesday last, the first occasion when a quorum of the Standing Committee on the measure met, the Bill was withdrawn. Considerations of sentiment and also of sentimentality played so large a part in this Bill that discussion of its purport is still desirable, although impossible without hurting the feelings of some who are interested. The Bill received a substantial amount of support in the House of Commons, though it was by but a small majority that it secured a second reading. There is no doubt that a great many members were prepared to vote for it, unless they could be shown sufficiently grave reasons for refraining. Up to a certain point the question is not one of hostility to physiological research as such, though naturally the opponents of research supported the Bill, if only as a base for future assaults; but we have had here an appeal mainly to that affection for the dog which is widely manifested by all sorts and conditions of men and women, and based on perfectly comprehensible feelings and reasons. But that these feelings can be pressed too far is demonstrated at once by considering, as Lord Lamington did in his presidential address this week to the Research Defence Society, the loss of our dog friends by distemper, a disease for which we may surely hope that scientific medicine, unfettered in its working, will soon find a remedy.

There is, admittedly, none of the domesticated animals which is capable of showing such devotion, such loyalty, to man as the dog; or which so uniformly receives in return so much human affection and companionship. Not to admit oneself a dog lover is almost to proclaim eccentricity, if not worse. But those whose bias would have led them to favour this Bill cannot be allowed to assume without protest that they alone entertain natural feelings. Physiologists and surgeons are just as fond of dogs as are any other members of the community. Some antivivisectionists, of course, have persuaded themselves that all who pursue physiological research are callous persons, who are insensible to feelings of compassion even if they do not gloat over cruelty for the mere sake of it; but this extraordinary misconception was surely not harboured by the majority of those who supported Sir FREDERICK BANBURY'S Bill in the division lobbies. To these, and all the many other reasonable people who are inclined to approve of a measure to exempt dogs from vivisection, it is surely sufficient to say that men of science do not practise vivisection with the object of causing or of witnessing suffering in any created thing. They seek the relief, not the infliction, of pain and suffering; and in pursuit of that aim they perform experiments only when they must, and only on those animals whose use appears most likely to advance knowledge and reveal truth. For the great majority of the experiments on living subjects, which are performed in this country, the dog would be an unsuitable subject, and the dog is therefore not used; but we cannot overlook the fact that our most distinguished physiologists, men whom the scientific world in all countries delights to honour, have said emphatically that for certain types of research the dog is indispensable. Even if it were not so at the moment, it would still be imprudent to lay down any absolute prohibition of the employment of dogs, for it cannot be foretold what the requirements of future research will be. No one, it may confidently be stated, would prefer to use a dog for the purposes of physiological experiment when another animal would do equally well. The alleged cheapness of stray dogs is one of the motives frequently imputed by the antivivisectionists to those who hold vivisection licences. This is nonsense. Stray dogs are not so cheap to buy as are some of the other animals commonly used by research workers; they are very much more expensive to feed, and they form but a minute fraction of the total number of animals annually subjected to vivisection. Rats, guinea-pigs, monkeys, horses, rabbits, and many other species are represented on the lists returned by those who hold vivisection licences. Some of these animals are much cheaper, some much dearer, than dogs. Economic considerations do undoubtedly enter to some slight extent into the choice of subject for physiological use—none of our laboratories are so wealthy as to be able to neglect so obvious a point; but economical considerations militate against, not towards, the vivisection of dogs, and certainly the guiding principle in the selection is the suitability of the animal in question for the particular purpose of the experiment. This principle makes the granting of discretion as to the animals to be used a necessity, but it does not preclude the erection of all needful safeguards.

There is, however, one comparatively unimportant branch of vivisection in which restriction, or at least limitation, is in our view reasonable. We refer to the vivisections performed before physiology classes as demonstrations of the truth of the statements of their teachers and their text-books. It is true enough that all such experiments are performed under anæsthesia, and that the animals upon which they are performed are not allowed to regain consciousness but are killed as soon as the demonstration is completed. Nevertheless, the case in favour of these acts of vivisection is less impregnable than in respect of vivisection to promote new researches and to acquire new knowledge; and we could contemplate without any misgiving the entire abandonment of dogs as subjects for these demonstrations. Whether it is in the public interest that such a restriction as this should be enacted by Parliament, and in an absolute form, is a matter of opinion. But there can be, in our judgment, no question that the passage into law of the infinitely more sweeping provisions of Sir FREDERICK BANBURY'S Bill would have been an unfortunate thing. In this connexion it is satisfactory, in the event of the reintroduction of a similar measure, that the Home Office has intimated the need of allowing the use of dogs for vivisection in special circumstances. Here is a plain enough indication that the mischief of total prohibition is recognised in those quarters best qualified, next to the medical profession and students of physiology, to pronounce an opinion, but a Bill containing such a clause would still be both retrograde and unnecessary. The responsibility of the research worker towards the dog would possibly be emphasised; this no one could quarrel with. But to transfer the responsibility of deciding whether or not the dog would be the most suitable animal for any projected experiment from the professor of physiology to the permanent official would be a countervailing disadvantage so great as to justify again the opposition with which Sir FREDERICK BANBURY'S Bill met, an opposition which had the sympathy of the great majority of the medical profession.

Annotations.

"Ne quid nimis."

THE CHILDREN'S COUNTRY HOLIDAY MOVEMENT AND INFECTIOUS DISEASE.

FEW philanthropic undertakings have made more headway in recent years, or are more deserving of support, than those for the provision of country holidays for town children. Institutions such as the Children's Country Holiday Fund, the Pearson's Fresh Air Fund, and the Ragged School Union send every year many thousands of children into the country from London and from the larger provincial towns, while in addition there are large numbers of special organisations in working-class parishes for sending smaller parties to the sea or to quarters inland. Like all good things, the movement has its occasional drawbacks, one of which is that sometimes the influx of town children into country cottages and quarters is suspected to be the starting point of infectious disease, or to cause an unsatisfactory degree of overcrowding in rural areas where the housing provision for the indigenous population is already none too liberal. Such results, it is clear, can to a large extent be prevented by the selection of suitable districts and quarters and by inquiries as to the health of the children before they leave the town. In order to promote organisation for this purpose the Local Government Board has issued a circular to county councils and sanitary authorities indicating the way in which they may usefully coöperate with the organisations in question. The circular points out that effective preventive action rests primarily with the agencies concerned, and that it is no part of the duty of the medical officers of health in the country districts to undertake special supervision of the arrangements made for these children or to advise the agencies organising the holidays. It is believed, however, that if intended arrangements are communicated beforehand, the medical officer of health in the country will generally be prepared to assist the agency by preventing children being sent to houses where they would be exposed to risk of infection or to insanitary conditons, while he will find it an advantage, should infectious disease occur, to be in touch with the persons who are responsible for the care and maintenance of the children. The circular advises the agencies to make personal inquiries through voluntary workers at the children's homes before they are allowed to go for the holiday, and to invite the assistance of the town medical officer of health in ascertaining whether notified or other infectious diseases are present in the houses from which the children are sent away. Reference is also made to the aid which the town authorities can give to the agencies in securing that the children are sent away for their holidays in a cleanly state. The document, which can be obtained on application to the Board, should be useful by securing the concerted action which is desired, and indicating the extent to which coöperation may reasonably be asked for.

GUNSHOT WOUNDS OF THE SPLEEN.

Michelson, in the *Deutsches Archiv für Chirurgie* (Band cxx., H. 1–4), discusses both diagnosis and treatment of this comparatively rare accident. He has collected 80 cases from the literature, and refers also to his own experiences. It is rare that the spleen is alone damaged; this occurred in only seven cases, including one of the author's; most often the stomach or intestines are injured as well. When this is the case it is usual that the symptoms associated with these lesions mask those attributable to the spleen. On this account the diagnosis of splenic injury is frequently impossible. The site of the wound is often not a safe guide, for an instance is recorded in which the injury occurred in the fourth interspace and yet the spleen was found to be damaged. Sometimes there is little hæmorrhage in the early stages; internal hæmorrhage is inconstant. Perhaps the most constant sign of splenic injury is rigidity of the abdomen. When the blood accumulates along the posterior wall of the abdomen or behind the peritoneum, a very characteristic physical sign is a slowly developing rigidity of the upper abdomen. Treatment is operation and removal of the spleen. The operative mortality is high, 33·3 per cent., no doubt not so much due to the actual lesion as to the associated complications found. But where operation is not performed all the cases have been fatal. The author speaks strongly against the procedure of tamponade; splenectomy is the operation of election.

THE MUSEUM OF THE ROYAL COLLEGE OF SURGEONS OF ENGLAND.

THE conservator of the Museum of the Royal College of Surgeons, Professor A. Keith, has issued his annual report, and the show of specimens added during the past year is now on view, and will continue to be displayed until the end of the month. The anthropological collection has received many highly important additions, skulls of ancient Egyptians, of Stone-age inhabitants of England found in their flint mines at "Grime's Graves," near Weeting, Norfolk, of Anglo-Saxons, and also, and not the least significant, of modern English people. These show more clearly than is generally suspected how certain definite changes have occurred in the physical condition of the people in recent centuries. Dr. T. Wilson Parry has presented a set of preparations made by himself to show the implements and methods of trephining practised by people in a stage of stone culture.[1] Mr. Barrington Nash has presented a cast, undoubtedly authentic, of the skull of Robert Burns. A large number of preparations throwing light on the genitals in relation to changes in external sexual characters are preserved in the museum. During the past year a "mule" pheasant has been graciously presented by His Majesty the King, and in this instance the rudimentary genital glands, probably ovaries, have neither oviducts nor testicular ducts, and therefore the bird is regarded as asexual or neuter. Mr. E. T. Newton, F.R.S., has presented the first of his "reconstruction models," made up of plates of wax, enlarged from a corresponding series of microscopic sections, and put together so as to make one enlarged model of an embryo or organ. As usual, there are many additions to the pathological series. Mr. H. A. T. Fairbank presented to the Museum this year a preparation showing "Sprengel's shoulder," a congenital elevation of the scapula, bilateral, and occurring in a female infant who died from marasmus when six weeks old; and Dr. J. Kingston Barton has given to the collection some skiagrams showing an apparent disappearance of bone tissue in the clavicle and a congenital hiatus in the upper part of the front wall of the thorax. Space prevents us from any mention of numerous other additions of high interest. The annual display and the conservator's instructive report well deserve the attention of the profession and of scientists. The exhibition runs a risk of being overlooked now that Fellows of the College mainly vote by papers, so that there is no longer a great concourse of visitors at the College on the day for the election of members of Council.

HYPOTHYROIDISM.

COMPLETE suppression of thyroid secretion produces the definite and well-recognised condition termed myxœdema, but partial suppression may also occur, and the effects are less definite, variable, and far from well recognised. To Dr. E. Hertoghe, of Antwerp, we are most indebted for their recognition. By patient observation extending over a period of 20 years he has shown that a variety of morbid states, the nature of which was not understood, are due to deficiency of thyroid secretion (hypothyroidism). Such deficiency is by no means uncommon and often is overlooked. In this country Dr. Leonard Williams has done much to call attention to it. Dr. Hertoghe has recently delivered a series of addresses in the United States on thyroid deficiency. In one, which is published in the Internal Secretions Number of *American Medicine*, he shows how widespread are the effects of thyroid secretion. He points out that no cell in the body can reach morphological perfection without thyroid stimulus. Hence the arrest of growth in cretins. Secondly, when a cell has done its work it disintegrates. If thyroid activity is below normal the carrying away of waste matter is incomplete, and mucin, fat, and other bodies accumulate, producing a certain form of œdema (myxœdema). Thirdly, he considers that the thyroid has a great influence over menstruation, pregnancy, and lactation; having an inhibitory action on menstruation, when it is subnormal the menstrual loss is increased. In pregnancy the thyroid is hypertrophied and pours into the blood an unusually large amount of secretion, thus, it is suggested, suspending menstruation. This action should be remembered, says Dr. Hertoghe, when repeated abortion resists ordinary treatment. After labour the increased thyroid secretion accelerates uterine involution and stimulates lactation. Dr. Hertoghe believes that hypothyroidism produces infiltration of every tissue, causing in muscles painful contractions, in nerves neuralgic and shooting pains, and in the central nervous system headache (migraine), dizziness, vertigo, and tinnitus, and in severe cases loss of consciousness, defective memory, and coma. To infiltration of glandular tissue Dr. Hertoghe traces serious and far-reaching symptoms: the sweat glands cease to act, intestinal secretions are dried up, hepatic activity is impaired, and canaliculi are compressed, causing a special kind of jaundice. Of effects on the skin he mentions premature falling and greyness of hair and striated and brittle nails. Loss of the outer third of the eyebrows he considers a striking sign. Eczema, psoriasis, seborrhœa, and alopecia find, he says, a favourable soil in the skin, and it is in these cases that thyroid extract gives good results. To infiltration of the bladder he attributes the formation of calculi or painful micturition. Bones, he says, become brittle, break easily, and are slow to unite. Hence thyroid extract is often useful in promoting the union of fractures. Cartilaginous tissues are also early affected. He describes as a pathognomonic symptom in the joints a crackling sensation like that produced by pressing on snow. Often the patient hears and feels crepitation of the cervical vertebræ. To infiltration of the cardiac muscle he traces a slow, weak pulse, and to infiltration of the nerve ganglia painful contractions with or without shooting pains in the left arm (false angina pectoris); to infiltration of respiratory mucous membrane dyspnœa, which in mild cases is intermittent and frequently mistaken for asthma. Hence the cases of asthma reported as cured by thyroid extract. In the gastro-intestinal tract the effects, he finds, are constipation and meteorism. He thinks that in time microbes migrate through the walls and reach the peritoneum and kidneys, and that the peritoneum in resisting invasion produces false membranes which grow into bands, causing kinks.

THE STREPTOBACILLUS PELLAGRÆ.

THE exhibition of a case of this disease at the recent meeting of the Dermatological Section of the Royal Society of Medicine recalls to our notice a paper on the streptobacillus pellagræ by Professor Guido Tizzoni, who occupies the chair of pathology at the University of Bologna.[1] The recent and more detailed researches among the rich material collected in pellagrous districts during the past year have enabled him to make known some new facts relative to the cultural characters and biological properties of the streptobacillus of pellagra which are of importance in establishing its more certain identification and in differentiating it more easily from the pathogenic and non-pathogenic micro-organisms which resemble it, and with which it might be mistaken on superficial examination. There are, according to Professor Tizzoni, two separate types of the streptobacillus, the streptococcal and the staphylococcal. The former is distinguished from the ordinary human streptococcus by the following characteristics: it passes through Carnot-Garnier tubes, which human and equine streptococci never do; in some phases of its evolution it presents distinctly bacillary forms; the lower limit of the temperature of development is higher than that of ordinary streptococci; it is not stained by Gram's method; it is distinctly hæmophile; it always coagulates milk within 24 hours, even after long preservation in a saprophytic state, while streptococci, both human and equine, coagulate milk only after one or more days; the colonies of the streptobacillus pellagræ in agar and gelatin differ from those of human streptococcus; and lastly, the cultures of the streptobacillus of pellagra sometimes undergo profound modification and pass from the streptococcal to the staphylococcal form. The second type, the staphylococcal, exhibits the following properties which distinguish it from the ordinary staphylococcus: it passes through Carnot-Garnier tubes, it develops in gelatin smaller and more granular colonies, it gives in fixation in gelatin rounder, larger, and more distinct colonies like those of the streptococcus, such cultures being paler in colour than the staphylococcus pyogenes, but acquiring the property of producing pigment after a saprophytic existence, the pigmentation being partial and never uniform as in the staphylococcus aureus and flavus; and lastly, when introduced under the skin or into the peritoneum of animals it never causes suppuration or fatal peritonitis. It appears, moreover, that there is no true transformation of one type into the other—i.e., a passing from the genus streptococcus to the genus micrococcus, but rather a simple transformation of a culture of a streptococcal type, by means of which, owing to a different grouping of the organisms, it assumes only from the microscopic point of view the appearance of the staphylococcus, retaining, however, in its colonies and gelatin cultures the fundamental characteristics of the streptococcus of origin.

THE VESALANIUM MISTAKEN FOR FRACTURE OF THE FIFTH METATARSAL BONE.

IN the *Boston Medical and Surgical Journal* of May 7th Dr. W. P. Coues has described a case of a very rare bony abnormality which is liable to be mistaken for fracture in X ray examinations. The vesalanium or bone of Vesalius of the foot is so rare that it is not mentioned in the standard modern works on anatomy of Sobotta, Piersol, Gerrish, Morris, Macalister, or Gray. It is described as follows by Professor Dwight in his "Clinical Atlas of the Variations of the Bones of the Hands and Feet": "The vesalanium, corresponding to the bone of the same name in the hand, is the proximal and external part of the tuberosity of the fifth metatarsal. It is excessively rare. I have never seen it in the macerated foot of an adult. Spronk has seen it at birth. I have once seen it in the skiagraph of a girl of 12. The entire base of the fifth metatarsal varies much in size. The vesalanium is usually more or less marked off by a groove on the plantar surface." The case reported by Dr. Coues is as follows. A healthy girl, aged 12 years, was seen at the Boston Dispensary. While running a week previously she slipped and fell, her ankle turning under her. After this she was lame and had considerable pain in the ankle. She was well developed and well nourished. Over the external lateral ligament of the ankle there was slight ecchymosis, and over the scaphoid bone tenderness. Movements of the ankle were free, but the child walked with a limp. A provisional diagnosis of sprain or fracture of the scaphoid bone was made, and the foot was immobilised in plaster-of-Paris. A skiagram showed what appeared to be the fracture of the base of the fifth metatarsal bone first described by Mr. Robert Jones in 1902. Its occurrence in childhood was thought most unusual. After two weeks the plaster was removed and another skiagram was taken which showed the supposed fragment in exactly the same condition as before, not united. There was distinct pain on pressure over the base of the fifth metatarsal, and it was supposed that the fragment was slow to unite. After another two weeks a skiagram showed the same condition. A skiagram was then taken of the opposite ankle which showed the same shell-like bone united to the base of the metatarsal by cartilage. All tenderness had disappeared in the left foot. The bandage was removed and weight-bearing on the foot was found possible. In consequence of the tenderness at the time of injury and afterwards an infraction of the cartilage uniting the vesalanium to the shaft could not be excluded. The importance of recognition of this rare abnormality is obvious. Dr. Coues suggests that some of the reported cases of fracture of the fifth metatarsal bone by inversion were examples of it, and others examples of fracture through the line of union to the metatarsal. A radiogram of the metatarsal bone on both sides should be taken in all cases in which fracture through the base of the fifth metatarsal bone has been diagnosed.

ARGYRISM FOLLOWING THE USE OF COLLARGOL.

CASES of chronic silver poisoning or argyrism are much less frequently seen than they used to be, in consequence of the disuse of silver as an internal remedy. In the *Journal of the American Medical Association* of May 2nd Dr. A. M. Crispin has pointed out that there is a danger that the prolonged use of the colloidal preparations of silver now in vogue, which are advertised as innocuous, may again familiarise us with argyrism. He reports the case of a young woman sent to him by her medical attendant with the request that she should be operated on for gall-bladder obstruction. Her complexion was of a dark bluish hue, with bright glistening eyes "compelling the wonder and admiration of all who beheld her." To the medical man it suggested a congenital heart lesion or intense cyanosis. This chromatic effect was a constant worry to an otherwise pretty girl. Sunlight seemed to increase the darkness of her colour. Examination of the chest revealed a perfectly normal heart and lungs. There were slight tenderness over McBurney's point and slight rigidity of the right rectus muscle. The most careful search failed to show any abnormality of hepatic function or anything to account for the blueness. On questioning she stated that she had taken collargol for four years under her medical attendant's advice, and had become "jaundiced." A blood count showed marked anæmia. Chronic appendicitis and argyrism were diagnosed. Before operating it was thought well to improve the patient's general condition and to try to clear her complexion. Potassium iodide had no effect on her colour. Acute coryza occurred, for which hexamethylenamine was given, and to Dr. Crispin's astonishment and the patient's joy her colour began to fade. She said that when she took her bath there was on the top of the water a supernatant film resembling oil, which she never observed before. Operation showed a chronically inflamed appendix, which was removed. The muscles and intestines had a bluish tinge. Dr. Crispin suggests that in a case of argyrism hexamethylenamine deserves a trial.

SECTION OF NERVE-ROOTS FOR BRACHIAL NEURALGIA.

DIVISION of the posterior nerve-roots has become a procedure of possible benefit in several conditions in which persistent pain constitutes the dominant symptom, and pain, too, which is often of so intractable and of so distressing a character as to justify what must be regarded as a serious operation. It has been practised, not only for the pain associated with the gastric crises of tabes dorsalis, with variable results, but also for erythromelalgia, again with some benefit in a few cases. For a case of persistent and acute brachial neuralgia this operation was done, and the report of the case is described by Sicard, Desmarsts, and Reilly in the *Revue de Neurologie* (1913, vol. xxvi., p. 107). The patient was a man aged 48. His complaint was severe paroxysmal algesia of the right upper limb. It resisted all forms of treatment and made the patient's life unbearable. An operation was finally agreed upon. The posterior roots of the seventh and eighth cervical nerves and the first dorsal were divided; the operation was performed with relative ease. The immediate result was relief of the pain. There was in addition complete anæsthesia of the skin areas supplied by the divided nerves. The reflexes were almost abolished. Recurrence of pain, however, followed, and two months later a second operation was performed at which the fifth and sixth cervical and second dorsal nerves were divided. There was some difficulty on account of adhesions resulting from the previous operation. The final result, however, was permanent relief of the pain. Now it was noted that there was, as before, complete anæsthesia. The reflexes were abolished. Movements were affected to some extent. There was no definite loss of power, but rather some unsteadiness of action, some ataxia. This was more marked when the eyes were closed. The patient could, however, perform all ordinary movements with fair accuracy. There was some loss of tone of the muscles. It was of interest to note that there was no adiadokokinesia, an observation confirmatory of Babinski's views of the nature and origin of this curious sign. In so far as the result showed abolition of the pain, it can be said that the operation was successful and justifiable.

ON the occasion of the tercentenary of the foundation of the University of Groningen the degree of Doctor of Medicine *honoris causâ* has been conferred upon Sir Edward Schäfer and Professor J. N. Langley.

THE MILK AND DAIRIES BILL AND THE BACTERIOLOGICAL EXAMINATION OF MILK.

BY R. TANNER HEWLETT, M.D. LOND., F.R.C.P. LOND., D.P.H.,
PROFESSOR OF BACTERIOLOGY IN THE UNIVERSITY OF LONDON (KING'S COLLEGE).

THE Milk and Dairies Bill, 1914, contains one important alteration, or rather addition to its predecessors. In Clause 5, Section 2, it grants powers to health authorities to take samples of milk for "bacteriological examination." Now, judging by the Bill of 1912, Clause 2, Section 3, it is by no means improbable that to the framers of the Bill this bacteriological examination is intended to cover examination for B. tuberculosis only, either by microscopical or inoculation methods. In such a sense and so far the idea is good, and is rendered acceptable by the additional enactment that such samples shall be divided into three parts and the necessary check examinations made as may be desired.

Unfortunately, in Clause 15 the word "bacteriological" is not defined, and it is certain that by most health authorities it will be regarded in its widest sense, an assumption rendered all the more probable by amendments which have been moved in committee to add the words "or other" to "bacteriological." This addition would include the whole field of biological, enzymic, and physical tests, which are constantly brought forward as being infallible methods of judging of the purity of milk, and which, though constantly shown to be more or less fallacious for public health work, yet have such an attraction for the hygienic enthusiast that it is well-nigh impossible to shake his belief in their infallibility. There can be little doubt that the introduction even of a general quantitative bacteriological examination of milk will be fraught with great difficulties and much unnecessary disturbance to those engaged in the milk trade, and should there be added to this anything approaching a qualitative examination, then there is scope for any quantity of misguided energy.

It appears to be forgotten by those who advocate this sort of control that no country has adopted it for legal purposes except in the case of certain special milks which are sold under certain fixed conditions and for which a special price is paid.

Quantitative Enumeration of Bacteria in Milk.

But there are some considerations which must be carefully weighed by those who advocate a simple quantitative enumeration of the bacteria present in a sample of milk as a criterion of its cleanliness and age, and which, if rightly apprehended, show that such a simple enumeration, while direct in its answer as to numbers, gives no reply as to the means by which such numbers are attained. Briefly these are some of the considerations:—

I. We have no reliable data as to what the bacteriological content of milk should be when milk is delivered to the public after such reasonably proper handling as is possible in commercial work. Figures purporting to give such information there are undoubtedly, but the conditions under which these were obtained are not the conditions of practice. How often milk is obtained from a cow direct, and simply kept in a vessel of some kind and examined after 24 or 48 hours at certain fixed temperatures, and the consequent multiplication ascertained. Now any butter-maker knows that if he wants his "starters" to sour more rapidly he must stir them well at intervals, and in ordinary practice milk from the time it leaves the cow till it gets to the consumer is in constant motion, which without doubt produces a profound effect on bacteriological multiplication. Again, the process of straining, especially when centrifugal cleaners are used, and also of cooling, all tend to increase the apparent number of effective organisms by breaking up colonies and rendering active organisms which by enclosure in such colonies had ceased to be available. The following experiment will show the effect of a centrifugal cleaner, which while actually removing many organisms (as could be seen by the qualitative character of the experiments) apparently increases the bacterial count. Six churns of milk were mixed and passed through a centrifugal cleaner running at about 600 revolutions per minute; before passing, 3,900,000 organisms per c.c.; after passing, 5,400,000 organisms per c.c. Also the effect of agitation becomes the more marked as the bacteriological content increases, and it is just at the time when multiplication has already taken place—namely, after arrival at the distributor's premises—that it undergoes the most drastic agitation, and the rate of increase is accelerated out of all due proportion.

II. Any value which might attach to a quantitative examination is completely lost if at any stage the milk be subjected to pasteurisation. It is quite possible to pasteurise milk in such a manner that there is no outward indication that this has been done, and yet the bacterial content be brought within any desired limits, and there would also be no indication as to how often this might have been practised. This is probably one of the most potent objections to bacteriological standards on account of the false idea of freshness which they may imply. This is not the place to enter into the question of the merits or demerits of pasteurisation, but, at any rate, it does not make for improvement in the milk-supply.

Bacterial Development in Milk in Ice-rooms and Ice-boxes.

III. With the effect of weather vagaries, of actual climatic conditions, as opposed to temperature, and of the awkward concurrence of an impoverished and tepid water-supply on farms at times when prolonged or excessive heat renders a plentiful and cold supply for cooling most necessary, there is not space here to deal, but the effect of holding milk in ice-rooms on bacterial development touches this question of bacteriological examination very closely.

It must be clearly understood that since (at least in the case of London) milk reaches the distributor each day during the hours of 12 midnight and 4 A.M., and again from 11 A.M. to 4 P.M., and that the usual times of delivery of milk to the consumer are from 5 A.M. to 7 A.M., and from 12 midday to 3 P.M., nearly half the day's supply arrives at a distributing station after the last round (12 midday) has been dispatched. The milk so arriving must be held for the next morning's delivery. This necessitates some hours' storage in ice-rooms, and for practical purposes a temperature of 45° F. is generally attained. It might be supposed that at this temperature multiplication would be so slow as to be almost negligible, but the results of a few experiments show that this is not the case, and the higher the initial count on going into the ice-room, the greater will be the development during storage. 1. A churn of milk chilled to 45° F. on the cooler contained 483,000 bacteria per c.c. The same kept 18 hours in the ice-room at 43°–45° F. then contained 970,000 per c.c. 2. The following results were obtained with churns of milk taken after passing a centrifugal cleaner, these being then kept in the ice-room at 45° F. for 18 hours.

(*a*) Before storage	... ...	4,000,000	bacteria per c.c.
After ,,	... ...	12,320,000	,, ,,
(*b*) Before storage	... ...	2,000,000	,, ,,
After ,,	... ...	8,100,000	,, ,,
(*c*) Before storage	... ...	3,000,000	,, ,,
After ,,	... ...	10,300,000	,, ,,
(*d*) Before storage	... ...	2,220,000	,, ,,
After ,,	... ...	5,120,000	,, ,,
(*e*) Before storage	... ...	3,760,000	,, ,,
After ,,	... ...	5,550,000	,, ,,

3. Small samples of milk (50 c.c.) kept under similar conditions.

(*a*) Before storage	... ...	1,580,000	bacteria per c.c.
After ,,	... ...	7,500,000	,, ,,
(*b*) Before storage	... ...	1,910,000	,, ,,
After ,,	... ...	8,500,000	,, ,,

These all have a very direct bearing on the results of taking samples of milk and placing them in ice-boxes and sending them to laboratories for examination. The temperature of an ordinary good ice-box is by no means steady, as the following readings will show:—

Time.	Temperature. Inside.	Temperature. Outside.
10 A.M.	37·5° F.	... 65° F.
1 P.M.	39·2°	... 67°
6 P.M.	41·0°	... 63°
10 A.M. (next morning) ...	53·0°	... 65°

If small samples kept constant at 43°–45° F. show the increase stated above, what will it be when the conditions are those of the ice-box, and yet when samples are divided into three it is impossible that all will be kept under identical conditions or be examined at the same interval of time. What a fruitful source of discrepancy and unjust deduction is here!

The following is an actual experiment made under such conditions. Two samples of milk were taken and placed for one hour in an ordinary good type of ice-box, such as is used for sending samples for bacteriological examination by rail or post, the copper receptacle being well packed with ice. A quantitative examination was then made in each case and the bottles returned to the box and kept in it for 24 hours and again examined. The temperature of the milks was then 60° F., with an outside temperature of 64°. The results were as follows:—

	Start.	24 hours later.
Sample 1	168,000	550,000
Sample 2	10,800,000	36,500,000

These samples were deliberately chosen to have a high and a low initial count respectively, and in each case show a very marked increase during an interval which would be a normal one if samples were dispatched by rail to bacteriological laboratories, as would be the case in most instances.

EPSOM COLLEGE.

THE annual general meeting of the governors of Epsom College was held at the office in Soho-square on June 26th, Sir Henry Morris, the treasurer of the College, being in the chair. He was supported by a very large number of governors, amongst whom were: Mr. S. Boyd, Sir John F. H. Broadbent, Mr. J. Paul Bush, Dr. F. Charlesworth, Sir William S. Church, Sir Thomas Boor Crosby, Sir Dyce Duckworth, Mr. A. P. Eldred, Dr. L. Grant, Dr. W. S. A. Griffith, Dr. F. de Havilland Hall, Mr. H. E. Haynes, Mr. H. Hilliard, Mr. D. Keele, Mr. J. B. Lawford, Mr. J. H Morgan, Mr. W. A. Propert, Dr. G. Rankin, Sir James Reid, Dr. St. Clair B. Shadwell, Colonel Bruce M. Skinner, A.M.S., Dr. S. Sunderland, Dr. F. Taylor, Dr. W. E. Wynter, and Mr. E. P. Young.

The SECRETARY read the report of the scrutineers as to the successful candidates for pensionerships and foundation scholarships as follows:—

PENSIONERSHIPS.	Votes.
Nunn, Alice S.	5418
White, Marianna W.	4579
FOUNDATION SCHOLARSHIPS.	
Dyson, Malcolm H. C.	7576
Morgan, Algernon W.	7250
MacDowell, Thomas W....	3895

The SECRETARY reported that as vacancies had arisen since the voting papers were printed, Emma M. Daniell would be elected a "Pugh" pensioner and William G. Hughes would be elected a foundation scholar at the Council meeting which would be held immediately after the annual general meeting.

The annual report of the Council to the governors stated that the foundation had suffered during the years 1912 and 1913 by the uncertainty which had overshadowed medical practice throughout the country, many medical men having withdrawn their contributions. The Council urged upon all friends of the College to do their best to secure fresh annual subscriptions in order that the work hitherto carried out by the Royal Medical Foundation might be maintained. This comprised the provision of 50 pensionerships of £30 a year for members, or widows of members, of the medical profession in reduced circumstances, and of 50 foundation scholarships, by means of which board, clothing and pocket money, and an education of the highest class are given gratuitously to necessitous sons of medical men. The report further impressed upon those intending to leave money for the Foundation of Epsom College the great importance of mentioning in their wills the official title of the College—namely, "Epsom College"—as a legacy of £500 which the Council thought was certainly intended for the College, had recently been lost as a result of what was, if the Council were right, a clerical inaccuracy in the descriptive title of the College. The work of the College, the general health of the boys, and the school discipline had, as usual, been quite satisfactory. The various school games—cricket, football, and hockey—had been played with success, the football team having won most of its matches; the Officers' Training Corps was in a flourishing condition; an aero section and workshop had been instituted; and the various school institutions had been very successfully carried on. Since the last annual general meeting G. W. Davis had obtained an open scholarship in science at St. Mary's Hospital; L. V. Ardagh had secured an exhibition for classics at Wadham College, Oxford; A. R. Wood had won an exhibition for science at Clare College, Cambridge; and two old Epsomians had gained open scholarships at St. Bartholomew's Hospital in October last—namely, G. K. Bowes in science, and J. W. S. Dick in arts.

In proposing that the report be adopted Sir HENRY MORRIS referred to the suggestion which had been made by some persons that the Royal Medical Benevolent Fund and Epsom College ought to have compromised in regard to the bequest left by the late Miss Glenny. He said that it would have been most unjustifiable for the College to agree to such a proposal, as the Council was convinced that the testatrix intended the bequest for Epsom College, and their opinion was fortified by the statement in the proof of Mr. Crosse, the solicitor to the testatrix and one of the executors, that the executors were satisfied that Epsom College was entitled to the legacy, that being the institution the testatrix intended to benefit. Furthermore, the executors would have been failing in their duty had they not done their very best to enable the bequest to reach the destination intended by the testatrix. The chairman emphasised the point that an interval of four days had elapsed between the occasion on which Mr. Justice Joyce stated that if either side knew, either by inadmissible evidence or otherwise, that the legacy was intended for the other, the legacy ought not to be contested, and the day on which judgment was given in favour of the Royal Medical Benevolent Fund.

Mr. PARKER YOUNG explained the reasons which had actuated the committee of the Royal Medical Benevolent Fund in the course they adopted, and expressed the hope that there would be no future difficulties between the two medical charities.

Formal business having been transacted, a vote of thanks to the chairman, moved by Sir WILLIAM CHURCH and seconded by Sir THOMAS BOOR CROSBY, brought the proceedings to a close.

ROYAL COMMISSION ON VENEREAL DISEASES.

AT the forty-third meeting of the Royal Commission on Venereal Diseases evidence was given by Dr. J. J. Pringle, physician in charge of the skin department of Middlesex Hospital and President of the Dermatological Section of the Royal Society of Medicine.

Dr. Pringle stated that of 36,151 cases of skin disease dealt with in the out-patients' department of the Middlesex Hospital during the last 25 years, 1853, or rather over 5 per cent., presented indubitable evidence of syphilis. This figure did not represent the number of patients who had attended the hospital for syphilitic manifestations, but only those who had been referred to the special department as suffering from some affection of the skin. Of the 1853 cases of syphilis 925 were males and 928 females. Dr. Pringle thought that this apparent equality of incidence in the two sexes was due to the fact that men do not willingly attend hospitals during working hours, except for diseases which in their opinion threaten life or cause grave discomfort or pain. On the other hand, anything causing disfigurement impelled women to seek medical advice. Of the 1853 cases of syphilis already mentioned nearly 24 per cent. were foreigners.

Dr. Pringle stated that he could not see his way to supporting or advocating any measure of compulsory notification of venereal diseases. The medical profession was, he thought, practically unanimously opposed to it, and even if made confidential its effects upon the public would be merely to drive them to seek treatment from unqualified persons. His experience both in hospital and private practice convinced him that much of the syphilis existent in England was of foreign importation. He believed that a considerable number of prostitutes left their own countries because they were unable to ply their trade there, and spread the disease in this country. It was important that this matter should be further investigated and that steps should be taken to deal with it.

Public Health.

ANNUAL REPORTS OF MEDICAL OFFICERS OF HEALTH.

Metropolitan Borough of Stoke Newington.—In London sanitary and social progress is greatly affected by the increasing "tenementation" (if the word may be allowed) of houses originally built and contrived for single families, and Professor H. R. Kenwood's report on Stoke Newington for 1913 brings out very clearly the drawbacks to such a tenement house in working-class neighbourhoods. The proper washing and drying of body clothing, bedding, and household linen is always difficult in these circumstances, and in many cases it is impossible. The one copper in the basement or on the ground floor has to be approached through someone else's kitchen or scullery; there are few if any conveniences in the shape of mangles, washing boards, and the like, and the drying has to be done in a small room which must often serve as a living room, and which is crowded at times throughout the day. A tenement house lacks adequate space for healthy reasonable comfort or for children to play, has no provision for storing food or proper facilities for washing up, and no place for storing coal or wood. Little advantage can be expected from school education in "hygiene," or from visits of sanitary inspectors and health visitors, while the means of carrying out elementary requirements of cleanliness are absent. The local authorities in London are able to enforce the provision of a water-supply on each floor of a tenement house, but this is often met merely by the provision of a tap on the landing, and all dirty water has to be carried down one or more flights of stairs. It ought, in Professor Kenwood's view, to be possible to demand that a scullery sink should be provided on each floor. Where the total number of lodgers in a tenement house exceeds 12 the landlord is required to provide a second water-closet, but almost invariably this is placed alongside the other water-closet in the backyard. It should be on the first floor, where it could also serve if necessary as a slop sink. Provision should be required for the proper storage of food in respect of each tenement, against an external wall, and properly lighted and ventilated. Professor Kenwood also lays stress on the defective principle on which the laws relating to these houses are based. The landlord should be required to maintain his property in a sanitary state under a penalty, whereas at present "he has no obligation to do anything until insanitary conditions are belatedly discovered by the sanitary inspector and a notice is served upon him." Professor Kenwood is evidently of opinion that Section 15 of the Housing and Town Planning Act, 1909, of which much was expected, is inadequate for this purpose. Realising that the insanitary tenant is often by no means free from blame on his own account, the report advocates additional powers in by-laws relating to tenement houses by which the tenants themselves are made more responsible for cleanliness and the proper maintenance of sanitary provisions. It is difficult to read this report, which is confirmed by that of many other medical officers in recent years, without surprise that these matters have not already been more seriously taken in hand in London. The matter of tenement houses is one on which the Local Government Board and the London County Council might be expected to have a settled policy, in the active pursuit of which any necessary additional legislation should be strongly pressed for. Possibly the solution lies in the annual licensing of all such houses. Professor Kenwood reports what appears to be an exemplary penalty for milk adulteration in Stoke Newington. The defendant, who had several previous convictions against him, was proceeded against for selling milk containing 8 per cent. of added water, and was fined £100, with costs, with the alternative of three months' imprisonment.

Guildford Rural District.—Dr. R. W. O. Pierce refers to an investigation made by Dr. E. P. Manby for the Local Government Board, which showed that a shortage of working-class dwellings existed throughout the district, and particularly in five parishes. This confirmed the opinion which the medical officer of health had frequently expressed, but from which the district council dissented. It seems to be argued that no action need be taken by the local authority, as many of the cottages are occupied by persons working in other districts. This fact, however, hardly lessens the responsibility of the district council to use the Housing Acts for the purpose of providing cottages where there is a clear demand for them by persons working in their district, and it may be supposed that the council would have full control over the tenancies of any working-class houses which they provided under the Housing Acts. Dr. Pierce states that the four cheap cottages erected at Merrow by Mr. St. Loe Strachey could have been let over and over again. He doubts, however, if the solution of the rural housing problem can be found in attempting to build a £100 cottage, which really means the reduction of the cost of materials and construction to the lowest limits of habitability. The Merrow cottages are characterised in nearly all details by cheapness of materials and omission of many items usually considered necessary from the points of view of sanitation and convenience. A particular defect in such cheap cottages is the lack of cubic space; even old and otherwise insanitary country cottages frequently have a roominess which is absent from the modern cottage, in the construction of which the low common lodging-house standard of 300 cubic feet per person is too readily accepted. Good and substantial cottages, even when built in numbers by contract, cannot be erected in this part of Surrey under from £175 to £200 each. Dr. Pierce asks why the rural worker should be required to put up with a cheap and unsatisfactory cottage, and remarks that this country is not so impoverished that it is obliged to provide for its rural population by makeshift methods. In regard to the treatment of tuberculosis in non-insured persons (excluding dependents of the insured) a scale of costs was arranged last year between the district council and the county council of Surrey. The latter are to pay one-quarter of the total cost and the Treasury one-quarter. The other half is to be made up from the funds of the rural district council and from the Treasury grant in equal amounts, after deduction of any sums received from the patient. In 1913 tuberculosis work by the county council appears to have been limited to domiciliary visiting of insured patients by the county tuberculosis officer. A dispensary is now to be established in Guildford, and progress will be made with the institutional treatment of both insured and non-insured persons. The report refers to the working of the tuberculosis Order of 1913 in regard to tuberculous cattle; experience so far has shown that the veterinary examination of cows in the manner prescribed by the Order cannot take the place of systematic veterinary inspection of all the milking cows of the district, which is needed if the tuberculous cows are to be identified. It is noteworthy that out of five cows suspected to have tuberculous udders, on veterinary examination under the Order, four did not yield milk in which tubercle bacilli were found on centrifugalising.

Auckland Rural District.—This report, like the two above referred to, contains instructive information on housing questions. The Durham colliery village, as is well known, often consists of large numbers of houses built in rows, which do not allow of through ventilation, and have upper rooms the height and lighting of which are altogether inadequate. The houses have no yards or spaces belonging to the dwelling, but abut on unpaved common yards or back streets the chief feature of which is the line of capacious middens in between the rows of houses. It is evident from Dr. John F. Macdonald's report that the council of the Auckland rural district are making considerable progress under the Housing Acts in improving such villages, and that inspection is proceeding fairly rapidly. Plans are given in the report to illustrate clearances which have been made, and photographs show the great improvement which has resulted either by repairing closing, demolition, and rebuilding, or by getting the roofs of the houses raised and substantial large bedroom windows provided in place of the small apertures which formerly served as window spaces in the upper rooms. The work has been largely undertaken by different colliery owners as a result of the representations of the local authority and its public health officers. Self-contained yards have been added in some cases, and insanitary privy middens have been removed. Over 100 new houses were erected and occupied during 1913. Out of 397 cases of scarlet fever notified during the year 233 were removed to hospital. Dr. Macdonald gives a table to show the occurrence of secondary cases in households infected by scarlet fever (*a*) when the primary case was taken to hospital and (*b*) when the primary case was treated at home. While as many as 14 households were affected by return cases after the primary case had been sent home from the hospital, about four times as many secondary cases occurred when no hospital treatment was given to the primary case. In preparing this table Dr. Macdonald has in each instance reckoned the proportion of attacks on susceptible children under the age of 14.

VITAL STATISTICS.

HEALTH OF ENGLISH TOWNS.

IN the 97 English and Welsh towns with populations exceeding 50,000 persons at the last Census and whose aggregate population at the middle of this year is estimated at 18,120,059 persons, 9192 births and 4193 deaths were registered during the week ended Saturday, June 27th. The annual rate of mortality in these towns, which had been 13·2, 13·5, and 12·9 per 1000 in the three preceding weeks, further fell to 12·1 per 1000 in the week under notice. During the first twelve weeks of the current quarter the mean annual death-rate in these towns averaged 13·9, against 13·1 per 1000 in London during the same period. Among the several towns the death-rate last week ranged from 4·9 in Swindon, 5·5 in Bournemouth, 5·6 in Southend-on-Sea, 6·1 in Hastings, 6·3 in Croydon, and 6·6 in Walthamstow, to 17·3 in Liverpool and in Middlesbrough, 18·3 in Oldham, 18·4 in Smethwick, 19·8 in Wakefield, and 21·1 in Stockton-on-Tees.

The 4193 deaths from all causes were 304 fewer than the number in the previous week, and included 394 which were referred to the principal epidemic diseases, against 395 and 390 in the two previous weeks. Of these 394 deaths, 144 resulted from measles, 93 from whooping-cough, 79 from infantile diarrhœal diseases, 35 from diphtheria, 30 from scarlet fever, and 13 from enteric fever, but not one from small-pox. The mean annual death-rate from these diseases was equal to 1·1 per 1000 and coincided with the rate in the previous week. The deaths attributed to measles, which had been 131, 119, and 140 in the three preceding weeks, rose to 144 last week, and caused the highest annual death-rates of 1·8 per 1000 in Stockton-on-Tees, 1·9 in Dewsbury, 2·0 in Smethwick, 2·1 in Warrington, 2·5 in York, and 2·8 in Oldham. The deaths referred to whooping-cough, which had been 117, 111, and 99 in the three preceding weeks, fell to 93 last week; the highest death-rates from this disease were 1·6 in Middlesbrough, 1·9 in Gillingham, 2·1 in Warrington, and 2·4 in Barrow-in-Furness. The fatal cases of diarrhœa and enteritis (among infants under 2 years), which had been 80, 69, and 79 in the three preceding weeks, were again 79 last week, and included 15 in London, 8 in Liverpool, 7 in Birmingham, and 3 each in Smethwick and Manchester. The deaths attributed to diphtheria, which had been 38, 56, and 40 in the three preceding weeks, fell to 35 last week, of which 11 occurred in London, 4 in Birmingham, and 2 each in Edmonton, West Ham, and Bradford. The deaths referred to scarlet fever, which had been 26, 24, and 24 in the three preceding weeks, rose to 30 last week, and included 6 in London and 3 in Liverpool. The fatal cases of enteric fever, which had been 9, 16, and 8 in the three preceding weeks, rose to 13 last week, and included 2 in London and 2 in Liverpool.

The number of scarlet fever patients under treatment in the London Fever and the Metropolitan Asylums Hospitals, which had steadily increased from 2862 to 3038 in the six preceding weeks, further rose to 3058 on Saturday last; 440 new cases were admitted during the week, against 339, 391, and 405 in the three preceding weeks. These hospitals also contained on Saturday last 1100 cases of diphtheria, 304 of whooping-cough, 72 of measles, and 35 of enteric fever, but not one of small-pox. The 1045 deaths from all causes in London were 8 fewer than the number in the previous week, and corresponded to an annual death-rate of 12·1 per 1000. The deaths referred to diseases of the respiratory system, which had been 179, 143, and 163 in the three preceding weeks, fell to 144 in the week under notice, and were 17 above the number recorded in the corresponding week of last year.

Of the 4193 deaths from all causes in the 97 towns, 176 resulted from different forms of violence and 377 were the subject of coroners' inquests. The causes of 29, or 0·7 per cent., of the total deaths were not certified either by a registered medical practitioner or by a coroner after inquest. All the causes of death were duly certified in West Ham, Portsmouth, Bristol, Manchester, Salford, Bradford, Leeds, Sheffield, Newcastle-on-Tyne, and in 73 other smaller towns. Of the 29 uncertified causes of death, 6 were registered in Liverpool, 4 each in Stoke-on-Trent and in Birmingham, 3 in St. Helens, and 2 in Hull.

HEALTH OF SCOTCH TOWNS.

In the 16 largest Scotch towns with an aggregate population estimated at 2,293,200 persons at the middle of this year, 1276 births and 641 deaths were registered during the week ended Saturday, June 20th. The annual rate of mortality in these towns, which had been 15·6, 16·0, and 14·4 per 1000 in the three preceding weeks, rose to 14·6 per 1000 in the week under notice. During the first eleven weeks of the current quarter the mean annual death-rate in these towns averaged 15·7, against a corresponding rate of 14·0 per 1000 in the 97 large English towns. Among the several towns the death-rate in the week under notice ranged from 8·8 in Kilmarnock, 10·1 in Motherwell, and 10·5 in Clydebank, to 18·3 in Leith, 18·7 in Greenock, and 18·9 in Hamilton.

The 641 deaths from all causes were 10 in excess of the number in the previous week, and included 67 which were referred to the principal epidemic diseases, against 62 and 48 in the two preceding weeks. Of these 67 deaths, 20 resulted from whooping-cough, 20 from infantile diarrhœal diseases, 17 from measles, 6 from diphtheria, and 4 from scarlet fever, but not one from enteric fever or from smallpox. The mean annual death-rate from these diseases was equal to 1·5, against 1·1 per 1000, in the 97 large English towns. The deaths attributed to whooping-cough, which had been 23, 19, and 15 in the three preceding weeks, rose to 20 in the week under notice, of which 16 occurred in Glasgow and 2 in Greenock. The deaths of infants (under 2 years) referred to diarrhœa and enteritis, which had been 7, 16, and 10 in the three preceding weeks, rose to 20, and included 9 in Glasgow, 4 in Dundee, 2 in Aberdeen, and 2 in Hamilton. The fatal cases of measles, which had been 17, 19, and 12 in the three preceding weeks, rose to 17 in the week under notice, of which 8 were registered in Glasgow, 3 in Dundee, 3 in Hamilton, and 2 in Clydebank. The 6 deaths attributed to diphtheria, of which 2 occurred in Aberdeen and 2 in Motherwell, were slightly in excess of the average in the ten preceding weeks of the current quarter. The deaths referred to scarlet fever, which had been 5, 3, and 7 in the three preceding weeks, fell to 4 in the week under review, and comprised 3 in Glasgow and 1 in Kilmarnock.

The deaths referred to diseases of the respiratory system, which had been 96, 99, and 95 in the three preceding weeks, further declined to 77 in the week under notice; and 24 deaths resulted from various forms of violence, against 22 and 24 in the two preceding weeks.

In the 16 largest Scotch towns with an aggregate population estimated at 2,293,200 persons at the middle of this year, 1301 births and 605 deaths were registered during the week ended Saturday, June 27th. The annual rate of mortality in these towns, which had been 16·0, 14·4, and 14·6 per 1000 in the three preceding weeks, fell to 13·8 per 1000 in the week under notice. During the first 12 weeks of the current quarter the mean annual death-rate in these towns averaged 15·6, against a corresponding rate of 13·9 per 1000 in the 97 large English towns. Among the several towns the death-rates last week ranged from 10·5 in Clydebank, 11·0 in Falkirk, and 11·3 in Motherwell, to 18·0 in Aberdeen, 19·0 in Kirkcaldy, and 23·0 in Perth.

The 605 deaths from all causes were 36 fewer than the number in the previous week, and included 52 which were referred to the principal epidemic diseases, against 48 and 67 in the two preceding weeks. Of these 52 deaths, 18 resulted from whooping-cough, 10 from infantile diarrhœal diseases, 8 from diphtheria, 7 from measles, 7 from scarlet fever, and 2 from enteric fever. The mean annual death-rate from these diseases was equal to 1·2 per 1000, being 0·1 above the rate recorded in the 97 large English towns. The deaths attributed to whooping-cough, which had been 19, 15, and 20 in the three preceding weeks, fell to 18 last week, and included 15 in Glasgow. The deaths from infantile diarrhœal diseases, which had been 16, 10, and 21 in the three preceding weeks, fell to 10 last week, and included 4 in Aberdeen and 2 each in Glasgow and Leith. The fatal cases of diphtheria, which had been 3, 2, and 6 in the three preceding weeks, further rose to 8 last week, and included 3 each in Glasgow and in Aberdeen. The deaths from measles, which had been 19, 12, and 17 in the three preceding weeks, declined to 7 last week, and included 5 in Glasgow. The deaths from scarlet fever, which had been 3, 7, and 4 in the three preceding weeks, rose again to 7 last week; 3 of the deaths occurred in Glasgow. The 2 fatal cases of enteric fever occurred in Glasgow.

The deaths referred to diseases of the respiratory system, which had been 99, 95, and 77 in the three preceding weeks, further fell to 64 in the week under notice; 26 deaths were attributed to different forms of violence, against 24 in each of the two preceding weeks.

HEALTH OF IRISH TOWNS.

In the 27 town districts of Ireland, with an aggregate population estimated at 1,205,280 persons at the middle of this year, 641 births and 410 deaths were registered during the week ended Saturday, June 20th. The annual rate of mortality in these towns, which had been 17·8, 16·7, and 17·9 per 1000 in the three preceding weeks, fell to 17·7 per 1000 in the week under notice. During the first eleven weeks of the current quarter the mean annual death-rate in these towns averaged 19·5 per 1000; in the 97 large English towns the corresponding rate did not exceed 14·0, while in the 16 Scotch towns it was equal to 15·7 per 1000. The annual death-rate in the week under notice was equal to 17·6 in Dublin (against 12·2 in London and 15·2 in Glasgow), 17·1 in Belfast, 19·0 in Cork, 11·4 in Londonderry, 23·0 in Limerick, and 30·4 in Waterford, while in the 21 smaller towns the mean rate was 17·3 per 1000.

The 410 deaths from all causes were 3 below the number in the previous week, and included 50 which were referred to the principal epidemic diseases, against 35 and 40 in the two preceding weeks. Of these 50 deaths, 19 resulted from measles, 15 from infantile diarrhœal diseases, 8 from scarlet fever, 3 from whooping-cough, 3 from enteric fever, and 2 from diphtheria, but not one from small-pox. The mean annual death-rate from these diseases was equal to 2·2 per 1000, against 1·1 and 1·5 per 1000 in the English and Scotch towns respectively. The deaths attributed to measles, which had been 19, 21, and 16 in the three preceding weeks, rose to 19, and comprised 8 in Belfast, 5 in Dublin, 5 in Sligo, and 1 in Drogheda. The deaths of infants under 2 years referred to diarrhœa and enteritis, which had been 10, 4, and 10 in the three preceding weeks, further rose to 15, of which 7 were registered in Dublin and 6 in Belfast. The fatal cases of scarlet fever, which had been 6, 1, and 4 in the three preceding weeks, rose to 8, all of which occurred in Belfast. The deaths attributed to whooping-cough, which had been 11, 6, and 8 in the three preceding weeks, declined to 3, and were all recorded in Cork. The 3 deaths referred to enteric, of which 2 were registered in Belfast and 1 in Dublin, were slightly in excess of the average in the earlier weeks of the quarter. The fatal cases of diphtheria were recorded in Belfast and Lurgan.

The deaths referred to diseases of the respiratory system, which had been 85, 63, and 67 in the three preceding weeks, were 68 in the week under notice. Of the 410 deaths from all causes, 142, or 35 per cent., occurred in public institutions and 6 resulted from various forms of violence. The causes of 12, or 2·9 per cent., of the total deaths were not certified either by a registered medical practitioner or by a coroner after inquest; in the 97 large English towns the proportion of uncertified causes of death did not exceed 0·7 per cent.

In the 27 town districts of Ireland, with an aggregate population estimated at 1,205,280 persons at the middle of this year, 665 births and 364 deaths were registered during the week ended Saturday, June 27th. The annual rate of mortality in these towns, which had been 16·7, 17·9, and 17·7 per 1000 in the three preceding weeks, fell to 15·7 per 1000 in the week under notice. During the first 13 weeks of the current quarter the mean annual death-rate in these towns averaged 19·2 per 1000; in the 97 large English towns the corresponding rate did not exceed 13·9, while in the 16 Scotch towns it was equal to 15·6 per 1000. The annual death-rate in the week under notice was equal to 15·5 in Dublin (against 12·1 in London and 13·2 in Glasgow), 17·5 in Belfast, 12·9 in Cork, 10·1 in Londonderry, 12·2 in Limerick, and 13·3 in Waterford; while in the 21 smaller towns the mean rate was 15·9 per 1000.

The 364 deaths from all causes were 46 below the number in the previous week, and included 36 which were referred to the principal epidemic diseases, against 40 and 50 in the two preceding weeks. Of these 35 deaths, 13 resulted from measles, 11 from infantile diarrhœal diseases, 6 from whooping-cough, and 2 each from enteric fever, scarlet fever, and diphtheria, but not one from small-pox. The mean annual death-rate from these diseases was equal to 1·6 per 1000, against 1·1 and 1·2 per 1000 in the English and in the Scotch towns respectively. The deaths attributed to measles, which had been 21, 16, and 19 in the three preceding weeks, declined to 13 last week, and included 5 in Belfast, 3 in Dublin, and 2 in Sligo. The deaths of infants under 2 years referred to diarrhœa and enteritis, which had been 4, 10, and 15 in the three preceding weeks, fell to 11 last week, of which 5 occurred in Belfast, 4 in Dublin, and 2 in Dundalk. The fatal cases of whooping-cough, which had been 6, 8, and 3 in the three preceding weeks, rose to 6 last week, and included 4 in Belfast. The deaths from scarlet fever, which had been 1, 4, and 8 in the three preceding weeks, declined to 2 last week; both deaths occurred in Belfast. The 2 deaths from diphtheria, one of which occurred in Dublin and the other in Cork, corresponded to the average in recent weeks. The 2 deaths from enteric fever were slightly in excess of the average; one occurred in Dublin and the other in Limerick.

The deaths referred to diseases of the respiratory system, which had been 63, 67, and 68 in the three preceding weeks, were 57 in the week under notice. Of the 364 deaths from all causes, 119, or 33 per cent., occurred in public institutions, and 1 resulted from violence. The causes of 10, or 2·8 per cent., of the total deaths were not certified either by a registered medical practitioner or by a coroner after inquest; in the 97 large English towns the proportion of uncertified deaths did not exceed 0·7 per cent.

THE SERVICES.

MARRIAGE "OFF THE STRENGTH."

IN face of the difficulty that at present exists in maintaining our military forces at their full authorised strength, any proposals that may increase the popularity of the army deserve careful consideration. They will always have a distinctly medical interest.

The great majority of soldiers serving with the colours must be unmarried, but the presence of a considerable leaven of married men has generally been held to have a good effect on the whole body of troops. The proportion of men allowed to marry, or whose married condition is recognised by the grant of certain allowances, varies from 100 per cent. in the case of senior non-commissioned officers down to 4 per cent. in the artillery and 3 per cent. in the infantry private. When placed on the *married roll* the man and his wife enjoy certain privileges and are granted certain allowances. But over and above the men who marry "with leave," in most corps there are many instances of soldiers who have married "without leave," and the condition of these men, their wives, and their families, very generally leaves much to be desired. An inquiry into this matter has been conducted by Mrs. Tennant, and her report[1] to the Secretary of State for War has recently been published. Mrs. Tennant is satisfied that hardship is caused by the present regulations to many men who are of an age at which they might reasonably expect to marry, but who, if they do so, must either leave the army or expose their wives to the poverty, discomfort, and distress almost inseparable from marriage "off the strength." This is particularly the case with sergeants in the home battalion of a regiment whose other battalion is in India. All the sergeants in the Indian battalion may marry, but only 50 per cent. of those in the battalion at home. When married sergeants come home from India, invalided or otherwise, they have to be absorbed into the home battalion before any of the sergeants in the latter may marry. To what extent marriage off the strength exists is apparently a question difficult to answer, the evidence adduced being very conflicting; but the conclusion was come to that in no case are the numbers negligible; its results are regarded as wholly bad, affecting both the fighting efficiency of the soldier (who shares with his family the rations intended for himself alone) and his health and general moral condition. Mrs. Tennant's principal recommendations are that all sergeants permitted to serve beyond 12 years should be allowed to marry, that 50 per cent. of the remainder should have the same privilege, and that a candidates' list should be established, admission to which would carry certain privileges, such as provision of convenient lodgings at a fair rent, instruction of the women in needlework and the care of infants, and the establishment of labour exchanges for women. For the young soldier marriage must be discouraged, and this discouragement must be "unwavering and untempered by contradictory charity." Other important recommendations are that the practice (at present permitted) of allowing men married off the strength to take their rations home should be absolutely prohibited, and that sleeping out passes should be restricted to married soldiers on the candidates' list. The proposals made would not, Mrs. Tennant thinks, lead to any great increase in expenditure.

Lady Haig contributes a report agreeing in many points with that of Mrs. Tennant; the establishment of a "waiting list" for men wishing to marry, from which they would pass on to the married establishment when a vacancy occurs; the building, or provision, of cheap quarters for families married off the strength, and the discontinuance of the practice of men taking their own rations home to their families are among the points regarded as essential. Mrs. Wilberforce would permit marriage off the strength to men of between 7 and 12 years' service under certain conditions. Mrs. Wavell chiefly insists on the utter misery resulting from marriages off the strength, and would grant no sleeping-out passes in such cases. The Hon. Mrs. Maxse would withdraw some of the privileges now possessed by the "off the strength" married woman, would establish a "waiting list," and confer certain privileges on those married couples admitted to it; she believes that the present military regulations "are the worst possible method of dealing with the question, and are, in fact, so illogical that they are not now carried out." Mrs. Robb does not believe that questions connected with the administration of the married roll are as carefully inquired into at generals' inspections as more purely military matters.

We have mentioned a few points specially emphasised in this report, which is a model of conciseness. The question is rather a difficult one to handle owing to the lenient view that has been taken for so many years of breaches of the regulations. We incline to think that a greater stringency or severity in the application of the rules laid down would in the end be the kindest course to pursue; this is the opinion of each of the contributors to the report, which is of a most thorough and exhaustive character, and deals admirably with a difficult subject. The Financial Secretary to the War Office stated in the Commons on Tuesday (June 23rd) that it is now being considered, and that action would be taken as quickly as possible to remedy the undesirable conditions.

ROYAL NAVY MEDICAL SERVICE.

The following appointments have been notified:—Staff-Surgeon: E. B. Kenny, to the *Pembroke*, additional, for disposal.

NAVAL MEDICAL RESERVE.

In order to afford officers of the Naval Medical Reserve opportunities of keeping in touch with the Naval Service in times of peace, His Majesty the King has approved, by an Order in Council, of such officers being re-employed or undergoing courses of instruction during peace in the following conditions: (1) To receive full pay at the rate of 17*s.* a day while re-employed or undergoing courses of instruction; and (2) to be under the same conditions as regards pension, &c., in case of death or injury as would be applicable in the event of their being called upon to serve in time of war or emergency.

ROYAL ARMY MEDICAL CORPS.

Colonel C. Birt has been appointed to officiate as Deputy Director of Medical Services to the Sixth (Poona) Division of the Southern Army in India.

Lieutenant-Colonel S. G. Allen has been appointed to command No. 28 Company, Royal Army Medical Corps, at Gibraltar. Lieutenant-Colonel E. M. Hassard has arrived home from India. Lieutenant-Colonel C. H. Hale, D.S.O., has been appointed to hold charge of the Military Hospital at Sialkot Cantonment. Lieutenant-Colonel E. G. Browne has taken up duty as Senior Medical Officer at Peshawar. Lieutenant-Colonel A. L. F. Bate has been appointed to the Recruiting Medical Staff at Woolwich. Lieutenant-Colonel H. E. Winter has been appointed to hold charge of the Military Hospital at Colaba, Bombay. Lieutenant-Colonel H. H. Brown has been appointed Senior Medical Officer to the North-Eastern Coast Defences at Newcastle. Lieutenant-Colonel W. E. Hardy has been appointed to hold charge of the Military Hospital at Calcutta. Lieutenant-Colonel C. A. Young has been transferred from Shrewsbury to Chatham.

Major H. G. F. Stallard, Mhow Division, has been appointed Deputy Assistant Director of Medical Services (Mobilisation) at Headquarters. Major J. G. McNaught has been placed under orders for service abroad. Major L. Addams-Williams has been transferred from Karachi to Quetta. Major H. L. W. Norrington has arrived home from Malta. An exchange on the roster for service abroad has been approved between Major R. Rutherford and Major J. S. Bostock; the latter officer will remain on the Home Establishment. Major C. T. Samman has taken up duty as Specialist in Mental Science to the Southern Army in India. Major R. L. Popham has joined at Peshawar. Major J. W. West has arrived home from India. Major J. Cowan has been transferred from Lahore to Pachmarhi Cantonment. Major F. W. Bliss has been appointed to the Chatham District. Major E. T. Inkson, V.C., has been appointed Deputy Assistant Director of Medical Services to the Wessex Division. Major J. G. Gill has arrived home for duty from Rangoon. Major E. E. Parkes has been appointed to the Military Hospital at Jubbulpore. Major J.

---

[1] Report of an Inquiry by Mrs. Tennant regarding the Conditions of Marriage Off the Strength. Cd. 7441. London: Wyman and Sons. 1914. Price 2d.

Tobin has arrived home from Gibraltar. Major H. M. Nicholls has been transferred from Poona to the Scottish Command. Major A. H. Safford has taken up duty in the Eastern Command. Major C. A. J. A. Balck has been appointed Specialist in Physical Training to the Dublin District. Major W. S. Harrison has been appointed Specialist Sanitary Officer at Jamaica. Major J. S. Gallie has been appointed to hold charge of the Military Hospital at Caterham.

Captain H. S. Dickson has arrived home from Gibraltar. Captain J. A. B. Sim has been transferred from the London District to the Aldershot Command. The following Captains have been placed under orders for service abroad during the coming trooping season: P. Davidson, D.S.O., H. B. Kelly, J. M. M. Crawford, C. Bramhall, H. J. J. Fawcett, and S. E. Lewis. Captain W. L. Baker has been transferred from the Eastern Command to the London District. Captain A. E. Hamerton, D.S.O., has been appointed to the Colchester District. Captain A. L. Stevenson has arrived home on leave of absence from Secunderabad Cantonment. Captain E. Bennett has been transferred from the Military Hospital at Purandhar to Deolali Cantonment. Captain G. Baillie has rejoined for duty at Colchester. Captain J. R. Yourell has joined at Rangoon. Captain A. L. Foster has arrived home from the Military Hospital at Aden. Captain D. S. B. Thompson has joined the Egyptian Army. Captain M. C. Wetherell has been appointed to hold charge of the Military Hospital at Fethard. Captain H. F. Joynt has been transferred from Cape Town to Wynberg. Captain A. S. Cane has taken up duty at Purandhar. Captain J. L. Wood has been appointed to hold charge of the Military Hospital at Richmond. Captain D. S. Buist has arrived home from Egypt. Captain S. S. Dykes has been transferred from Lebong to the Military Hospital at Dum Dum. Captain R. E. Todd has been appointed to the Public Health Department in Egypt. Captain L. V. Thurston has taken up duty in the Aldershot Command. Captain T. J. Mitchell has been transferred from the Military Hospital at Lahore to Subathu Cantonment. Captain W. J. Tobin has joined at Bangalore. Captain P. S. Tomlinson has been appointed to the Military Hospital at Roorkee. Captain O. R. McEwen has been appointed to the Irish Command. Captain C. E. L. Harding has been transferred from Quetta Cantonment to Aden. Captain A. G. Wells has been appointed to the Scottish Command. Captain J. Startin has arrived home on leave of absence from Satara Cantonment. An exchange on the roster for service abroad has been approved between Captain A. A. Meaden, serving at Colchester, and Captain J. M. H. Conway, adjutant of the Royal Army Medical Corps School of Instruction at Leeds; the former officer will proceed abroad instead of the latter. Captain E. B. Lathbury has arrived home for duty from Bareilly. Captain S. Field has been appointed to the Irish Command. Captain A. N. R. McNeill has taken up duty at Lichfield. Captain T. C. C. Leslie has been transferred from the Military Hospital at Youghal to the Allahabad Brigade. Captain J. H. Campbell has been appointed to Edinburgh.

Lieutenant F. S. Tamplin has arrived home from the Military Hospital at Gibraltar. Lieutenant S. D. Large has been appointed to the Scottish Command. Lieutenant W. L. Fretz has taken up duty at Peshawar.

INDIAN MEDICAL SERVICE.

Lieutenant-Colonel G. J. H. Bell, Inspector-General of Prisons, has been appointed to officiate as Inspector-General of Civil Hospitals in Burma, vice Colonel O. Evans. Lieutenant-Colonel A. W. T. Buist has been transferred from Campbellpore to Dalhousie. Lieutenant-Colonel G. McIver C. Smith has been transferred from Ludhiana to Murree. Lieutenant-Colonel S. H. Henderson has been appointed a Member of the Legislative Council of the United Provinces of Agra and Oudh. Lieutenant-Colonel C. T. Hudson has been appointed Civil Surgeon at Dharwar.

Major W. W. Jeudwine has been appointed to officiate as Civil Surgeon at Ferozepore, vice Major S. H. Lee-Abbott granted leave of absence. Major E. F. G. Tucker has arrived home from India. Major H. B. Steen has been appointed to officiate as Medical Officer to the 24th Parganas and Medical Inspector of Emigrants during the absence of Lieutenant-Colonel E. A. R. Newman. Major H. A. H. Robson has been appointed Civil Surgeon at Murshidabad in addition to his own duties. Major G. King has been appointed Civil Surgeon at Manbhum. Major W. H. Cazaly, medical officer 125th Rifles, has been appointed Specialist in Advanced Operative Surgery to the Fifth (Mhow) Division.

Captain L. P. Stephen has been appointed to hold civil medical charge at Ratnagiri. Captain T. S. Ross has been placed on special duty in Madras. Captain R. G. G. Croly has been appointed to Madras Presidency in the [Civil Medical Department. The services of Captain W. L. Harnett, civil surgeon at Kamrup, have been placed at the disposal of the Government of Bengal Presidency. Captain D. C. Kemp has been appointed District Medical and Sanitary Officer at Tinnevelly and Medical Officer to the Central Jail at Trinchinopoly. Captain W. Lapsley has been appointed to the Civil and Prison Department at Gonds. Captain C. M. Goodbody has been appointed Director of the Medical Department in Bikaner State. Lieutenant E. R. Armstrong has been placed in charge of the Bacteriological Research Laboratory at Brigade Headquarters at Jhelum Cantonment.

THE MILITARY SURGEON.

The June number of the *Military Surgeon* is chiefly concerned with the regulations of the Medical Corps of the United States Army, particularly with a circular to Militia medical officers, who may perhaps be called to service in Mexico. The importance of their work in recruiting is emphasised, and their duties in watching the conservancy of camps and securing prophylaxis of venereal diseases and typhoid fever are very distinctly enforced. THE LANCET'S account of the dinner in London to Surgeon-General W. C. Gorgas is reprinted. It caused some searchings of heart that the military surgeons of the United States at their recent meeting, in accordance with their regulations, only saluted at the last note of the British National Anthem, played in honour of the arrival of an English guest, who stood at the salute all through. Crotalin, rattlesnake poison, is a dangerous drug it is almost impossible to sterilise completely. Over one-third of the specimens investigated at the Hygienic Laboratory in Washington were found not to be sterile. As it causes a local necrosis and almost destroys the bactericidal properties of the blood its use requires the utmost caution. A fatal case, in which it was being used for epilepsy, has been reported. Major Lyster has had his method for purifying water adopted by the army. A canvas bag weighing 6¼ lb. and holding 38½ gallons of water has 15 gr. of hypochlorite of lime dissolved in it. The water is sterile after five minutes and the water bottles are filled from taps fitted at the base of the bag. There is an account of the hospital train of the Constitutionalist General Villa in Mexico. There are 25 cars; one is an operating room, one for bad cases, one for the staff, one for food, one for dressings; other cars had tiers of canvas cots and seats for wounded. There were 12 native surgeons and 20 male nurses. The train also carried the equipment for eight field hospitals and other medical stores. General Villa is reported to have said after the battle of Torreon that every wounded soldier was on the hospital train when the engagement closed. Major P. P. Lester, of the Colorado National Guard, was shot and killed by strikers near Walsenburg, Colorado, when attending a wounded militiaman under fire on April 29th.

VOLUNTARY AID DETACHMENTS.

The War Office announce that a committee has been appointed to inquire into the working and organisation of voluntary aid detachments. The chairman is Sir W. R. Lawrence, Bart., and the medical members of the committee are Colonel Sir George T. Beatson, K.C.B., Colonel Sir J. R. A. Clark, Bart., Major Sir Anthony A. Bowlby, C.M.G., and Surgeon-General W. G. MacPherson, C.M.G. The secretary is Lieutenant-Colonel G. B. Stanistreet, R.A.M.C.

ROYAL SOCIETY OF MEDICINE: ELECTRO-THERAPEUTIC SECTION.—An interesting meeting of this section took place at Oxford on June 27th. Many members met together at the Radcliffe Infirmary for tea, and later Sir William Osler addressed the section. Sir William Osler made some interesting remarks drawing attention to the astonishing progress in the electrical treatment of disease and in radiography in recent years. It was remarkable that two of the pioneers to whom electricity owed much were both laymen—John Wesley and Franklin. Of course there was no doubt that the real founder of electrical methods was Duchenne—the first who placed the electrical diagnosis of disease on a sound foundation.—Immediately following Sir William Osler's short address an excellent demonstration of the instruments and methods used in Oxford was given by Dr. W. J. Turrell, physician electro-therapeutist to the Radcliffe Infirmary. Dr. Turrell specially drew attention to diathermy and the use of the static machine, and later he showed many interesting cases that he had treated. The members of the section were delighted with the survey of the new building of the infirmary, and particularly with the complete installation in the electrical department. A dinner subsequently took place at Queen's College, Mr. C. Thurstan Holland, President of the section, in the chair, and the guests included Sir William Osler, Professor Perkins, the Rev. C. Cronshaw, treasurer of the Radcliffe Infirmary, and others. Sir William Osler proposed the health of the section, which was replied to by the President, who also heartily thanked Dr. Turrell for the trouble he had taken and the excellence of his demonstration.

MEDICAL PRACTICE UNDER THE INSURANCE ACT.

(BY OUR SPECIAL COMMISSIONER.)

(Concluded from p 1842.)

L.—NORFOLK AND NORWICH, WITH A NOTE ON IPSWICH.

FROM Lowestoft I went back into Norfolk, selecting naturally Norwich as the centre from which to make my investigations. Here I first interviewed men holding high positions on one or more of the committees concerned in working the Insurance Act, and I found that opinions and anticipations differed widely from those propounded by equally good authorities in Lancashire and Yorkshire and in parts of Scotland. One leading and representative practitioner found his fellow medical men in Norfolk "too individualist for anything like organisation. They are all little Popes and resent any interference; yet they are up against many social problems that can only be solved by legislation following on collective action." Certainly something very similar was said to me at Edinburgh by those who were opposed to the Act, but in the industrial districts of England and Scotland on the whole a contrary opinion is being held. It is generally assumed that medical men now see the necessity of union, only they find it difficult to agree upon the course for which they should unite. In Norfolk a pronouncedly independent spirit makes common procedure difficult. The Act is resented by some because it has brought with it common procedure, and establishes committees to interfere in a man's private affairs and leads to compulsory levies. The Norfolk men expect Panel Committees to become more and more bureaucratic, and many of them do not view the idea with relish.

The Medical Committee and the Panel Committee.

In Norfolk the Local Medical Committees have a voluntary levy, and panel practitioners now have to pay in two directions. Practitioners not on the panel may voluntarily subscribe to maintain the Medical Committee as an independent authority, as a counterweight to the Panel Committee; but for the most part the practitioners are on the panel, and a compulsory levy forces them to pay also for the Panel Committee. The question has arisen, particularly in the minds of the more peacefully inclined, whether the two committees are likely to be so constantly in conflict, and this on sufficiently important matters, for it to be worth while paying for both. Those less reconciled to the Act hold that because the attitude of the Government implies that Medical Committees are no longer wanted since the doctors have now got the Panel Committees, the medical men had better be careful to keep the former committees going, for the Panel Committees are considered to be too bureaucratic really to allow of representation of professional views. The Medical Committee is important because it will ensure that the profession should be considered as a whole, for there are interests that relate to the Insurance Act and concern others than the panel doctors, and those others should be heard, especially when problems of public health or preventive medicine are under consideration. The continued existence of the Medical Committees might also be a ready means of intercommunication between consultants and practitioners on the panel.

Lack of Union in the Profession.

The above impressions reflect conversations with prominent practitioners concerned with the Norfolk insurance area, who also say that political differences have exaggerated the discord among medical men. In the insurance area of the county borough of Norwich I found no great difference of thought. There is a Local Medical Committee for the city of Norwich, but doubts were expressed as to whether its voice was effectively heard. One Norwich practitioner declared to me that he did not believe that the profession would ever be able to fight again, and confirmed what his country colleagues had said. "We are all individualists," he remarked; "we cannot unite; the Act showed that there was no unity in us. Such a thing as a general union of the profession now does not seem at all likely." And it is a fact that the profession never realised the promise made that they would have the advantage of collective bargaining and they do not now understand what that means. It is a fact also that when workmen engage in a battle they are, as a rule, much better informed as to their own powers and willingness to resist than the medical profession has ever shown itself to be.

At Norwich the working of the Act is neither exactly satisfactory nor the reverse. Very few cases of contracting out have been allowed, but a good number of persons applied to be allowed to make their own arrangements because the doctor who had attended them for a long series of years was not on the panel. The refusal in some of these instances was deeply resented.

The Norwich Medical Institute.

At Norwich there is a medical institute, an old-established organisation which employs three whole-time men; it is popular because it is well organised. I have been able to obtain full details, which has not always been the case when I have tried to inquire into the working of similar bodies. Out of a population of 123,288 inhabitants it appears that about 45,000 are insured, and rather more than 6400 of these insured persons belong to the institute. Adding the wives and families, the total membership of the institute is probably 11,000. This seems too large a crowd for only three medical officers to cope with, but I was asked to remember one or two things. First, the wives and families have to pass a medical examination and are not accepted as members unless the result of the examination is satisfactory. Secondly, the medical officers have no private patients to see or any dispensing to do. Thirdly, the work is carefully organised. In regard to visiting, the medical officers have divided the city into districts so that there is no overlapping and the patients live close to each other; and they see each others' patients when thought necessary. There are two dispensers, and a secretary does all the clerical work. Carriage hire is provided when necessary, and one of the medical officers having a motor car receives an annual sum to cover the cost of its upkeep.

The Sweating Question.

The medical officers of this institute are very anxious to repudiate the suggestion that they are sweated. From a statement submitted to me in regard to the financial aspect of the matter, it appears that before the Insurance Act the medical officers received a fixed salary that never exceeded £305, plus midwifery and certificate fees. When the Insurance Act came into force the medical officers suggested that they should work on a percentage basis, and this the lay committee of the institute accepted. Of the 9*s*. the dispensing department receives 2*s*. The chemists obtain 44 per cent. of the 2*s*., and the rest pays for the drugs, the upkeep of the dispensary, &c. The remaining 7*s*. goes to the medical staff. Eighty per cent. of this sum is divided equally between the three doctors. The remaining 20 per cent. covers the carriage hire, upkeep of premises, cleaning, lighting, secretary's salary, stationery, &c. The income derived from the non-insured members of the institute is also divided in a similar manner among the medical staff, only they are given a smaller percentage. In the result, the three whole-time medical men employed by the institute receive £700 a year each exclusive of midwifery.

The medical officers claim, therefore, that they are not sweated, which shows that they do not use the word in its strict meaning. Under the sweating system many workers earn high wages. Sweating is not synonomous with bad pay. It means the process by which a third party—insurance agents or medical institutions in the case of medical men—can obtain a profit out of what the patient pays for medical service before the money reaches the medical attendant. The question is not whether the institute pays a good price to its medical officers, but whether it retains for its own benefit any part of the money paid by the patients for medical attendance.

In regard to overwork, which with low wages is so often associated with sweating as to be likewise, but erroneously, considered a part of the system, the medical officers to the institute make no complaint. One of them states that his visits average from 16 to 18 a day. Without counting the signing of certificates, and excluding Sundays, he sees for consultation at the surgery some 50 patients per day. This occupies three hours—an hour and a half in the morning and again in the evening. Each of the three medical officers takes in turn Sunday duty, and they also have a half day entirely free every week. "You will understand, therefore," said one of these to me, "why I resent the statement that all medical officers of institutes are third-rate practitioners giving only shoddy service in return for miserable pay. I have previously been in private practice, and when I remember the bad debts, the bookkeeping and dispensing, and the professional out-goings, I think there is no comparison between the possibilities of good work offered in private practice and institutional practice. That will also explain why I am a believer in a State service."

Increased Prosperity of the Medical Profession.

This roseate view of institutional work may not be borne out in other parts of the country, but there are grounds for it here.

There is a large working-class population at Norwich. Street after street is occupied almost exclusively by artisans, labourers, and employees of the several large factories. Before the Act came in force a very large proportion of these people belonged to clubs or friendly societies. They were consequently well accustomed to the limitations and inconvenience of contract practice. The better-class clubs paid 5*s*. a year for medical attendance and medicine, though the institute only got 3*s*. from its members. Consequently the doctors who attend patients by contract are very much better off than before, while, as already explained, the doctors at the institute, whose maximum salary was £305, now receive £700. There are 32 doctors on the panel, the majority of every available practitioner. As wages are low in Norwich there are not many fees to be obtained from the working class, and therefore in the past, as now under the Act, a very large proportion of the medical practice was contract practice. Women, children, and dependents generally belonged and still belong to clubs. There are juvenile clubs in Norwich to-day.

To prevent abuse by enforcing a wage limit a Public Medical Service was organised which attends to the dependents of many insured persons. Thus the amount of private practice that might be obtained through panel practice is very considerably reduced. Under such circumstances one of the leading Norwich practitioners insisted that the remuneration—the 9*s*. set aside by the Act for the medical service—was in no wise excessive when all the work involved, including the cheaper work that had to be done by the side of the panel work, was fully taken into consideration. He felt convinced that if this payment was reduced a good many practitioners would leave the panel.

The Allocation of Patients.

At Norwich, as elsewhere, there are some lists which are too long in my opinion, admitting, however, that a panel doctor who has a list of 3000 insured persons and no private patients might have some leisure, while another doctor with a list of only 1000 but a good many private patients would be more overworked. The difficulty is not with the visiting. The drawback of the system, as manifest at Norwich as at other places I have visited, can be found in the surgery, where the crowd is often far too large. Yet there have been no special complaints against the possessors of long lists. At the end of the first year's working, when those who might have cause to complain could go to another medical adviser, not one-half per cent. of the insured persons at Norwich asked to change their doctor. This seemed to indicate general satisfaction. Therefore when it comes to the question of dividing the fund created by those who have not selected a medical attendant the argument is that it is a fair presumption that those who have not made their choice would follow the lead of the majority. At Norwich the number who have not made their selection amounts to less than 3000. It is proposed to divide half the money equally among all the panel doctors and to give the rest out in proportion to the lists, those who have the longest lists receiving proportionately more.

But there is not only the question of dividing the money, there is the allocation of the insured persons who have not chosen a panel doctor. It appears that this will not be attempted at Norwich, at least not for the moment, though it has been done, and from what I can hear successfully, in the county of Norfolk. At Acle, for instance, where I paid a short visit, the local practitioners met in a friendly way and went over the list of those who had not selected a medical attendant. If anyone present had a claim, such as having already attended the person on some former even if distant occasion, the name was at once put on his list. Those whom no one knew were given to the nearest practitioner, or if two practitioners lived near to each other then those persons living in their neighbourhood were divided evenly between the two. This sort of friendly arrangement, it appears, cannot be managed so easily in a big city like Norwich.

The Indifference of the Insured.

A practitioner at Norwich not on the panel, who was attached to the Public Medical Service when the Act came into force, told me that he thought that the panel doctors were working well and doing well, but he complained of the absolute carelessness of the public. When he told some of his old club patients that he was not on the panel they loudly exclaimed, "What shall we do?" He suggested they might go on this or that panel, and they readily answered "All right," but went off without seeming to care in the least, and forgot to follow the advice. "And they will forget," he added, "until they are ill." On the point of contracting out, he urged that there were instances when patients should not leave the doctor to whom they had been accustomed for many years because he did not happen to be on the panel, and he was glad to think (I may say that he was in a position to know) that at Norwich the authorities were now giving permission to contract out of the Act more freely. My impression is that they are also realising that some of the panels should be reduced.

Some practitioners whom I interviewed complained that the working of the Act was not watched sufficiently by the medical profession or the public either. Thus in the county of Norfolk out of 92,000 insured persons the panel doctors have been credited with only 85,000. The authorities attribute this discrepancy to some extent to duplication of names, and cases were quoted to me of people entered in more than one list under slightly differing names. But this sort of error can only account for a small part of the deficiency.

The general impression prevails that the Act is working better in Norfolk than in most counties; the doctors have been glad to get a substantial increase of income. The average for the county would be a list of 520 insured persons for each panel doctor, and this average is fairly well maintained except on the borders of Norwich.

Medical Referees.

In regard to the question of referees, it does not seem that a satisfactory solution has been found here. The County Insurance Committee agreed that in each case the nearest practitioner should be the referee, and that he should receive a half-guinea fee and 1*s.* 6*d.* mileage beyond the first mile. No one knew, however, whether the Insurance Commissioners would approve, and it is certain that the panel doctors themselves are doubtful about it. It appears that if the doctor himself calls in the referee he will have to pay the fee, but it is more likely that a panel doctor will resign himself to lose one person from his list rather than pay a half-guinea fee. An Approved Society might occasionally find it advisable to incur such an expenditure; yet as the referee is not to be a recognised authority, but only the nearest neighbour, it may not always be considered worth while appealing to him. The neighbour may be quite a young man who has only recently commenced practice, or for this reason or that a practitioner whose opinion in the particular case would inspire no special confidence. Again, and whatever their respective standing in the profession, it is awkward for close neighbours to sit in judgment over each other's work. The temptation will be to let each other down gently, and that is not the object for which an appeal is made to a referee. Indeed, it looks as if the proposal was a manœuvre, a means of saying that something has been done, though in actual practice it is very unlikely that the services of such referees will ever be required.

Similar Problems at Ipswich.

I conclude this series of articles with a brief note on a visit which I paid to Ipswich this week. I found here conditions exactly analogous to those which I have so often described, and I will not at the present moment enlarge upon them. There was at Ipswich the same distinct spirit of resistance to the Act, the same annoyance among certain both of employers and employees at the compulsory contributions, the same rise in income coupled with an increase of work among some of those practitioners employed in contract practice, while a good many of the insured persons in Ipswich continue to employ and pay private practitioners. The record of sickness has obviously much increased since the Act came into force, and this was especially noticeable in a small women's club the figures in relation to which I obtained. The urgent need for referees is felt, and Ipswich is contemplating an elaborate scheme for their institution. The staff of the East Suffolk Hospital, which charity receives large sums from the working men of Ipswich, have arranged that the out-patient department will see an insured person once as a casualty; and then, if he desires to remain under hospital treatment instead of going to his panel doctor, his case is submitted to the honorary staff for decision. This seems to me to be a judicious method of dealing with a situation which has been embarrassing in many towns that I have visited. The subject is one to which I hope to have an opportunity of soon returning.

MEDICAL SICKNESS AND ACCIDENT SOCIETY.—The usual monthly meeting of the executive committee of this society was held at 429, Strand, on June 19th, Mr. J. Brindley-James being in the chair. The claim account presented still showed an improvement over that of last year, and the proposals received in these first five months constitute a record in the society's experience. The new combined sickness and endowment table with reduced premiums for the first five years is also proving popular with younger members of the profession. The votes for Epsom College were dealt with at this meeting, there being two candidates for Foundation Scholarships who are the sons of deceased members. The widow of a late member was also applying for a pensionership. The society subscribes £105 per annum to the College, and consequently controls a number of votes which are all used for the relatives or friends of deceased members.

LONDON DERMATOLOGICAL SOCIETY.—The annual general meeting of this society was held on June 16th at St. John's Hospital for Diseases of the Skin, Leicester-square, W.C. The President, Dr. Morgan Dockrell, presented the council's annual report, and said that the society had had a successful year, thanks chiefly to the large amount of clinical material they had at their disposal. Forty new Fellows had been elected during the year. The result of the election of officers for the ensuing year was announced as follows:—President: Dr. W. Griffith. Vice-President: Dr. Morgan Dockrell. Honorary Treasurer: Dr. W. Knowsley Sibley. Honorary Secretaries: Dr. J. L. Phibbs and Dr. Simonds Gooding. At the clinical meeting which followed Dr. J. L. Bunch showed a case resembling a Nodular Acne of the Face, from the lesions of which the ray fungus had been grown.—Dr. W. Griffith showed a case of Erythema Iris affecting the hands and mucous membranes.—Dr. W. Knowsley Sibley showed a case of Lupus Vulgaris which had been treated for over a year with tuberculins without improvement, but which was now improving under nascent-iodine treatment.—Cases of syphilis were shown by the President and Dr. J. L. Phibbs, and a paper was read by Mr. C. H. Mills, entitled "Some Points in the Treatment of Syphilis."

Home and Foreign Notes.

(FROM OUR OWN CORRESPONDENTS.)

MANCHESTER.

Memorial to Mr. Walter Whitehead.

ON June 27th the strikingly ornate, tall, and artistic monument—erected in a triangular plot of ground which has been converted into a charming garden—was presented to Bury by Mr. Henry Whitehead, in memory of his brother, Mr. Walter Whitehead. Sir Frederick Treves formally opened the gate of the gardens surrounding the memorial. The clock tower itself is 12 feet square and rises to a height of 80 feet above the ground. At the top is a clock with four dials 5 feet 6 inches in diameter. The dials can be illuminated at night by electricity. A bronze figure, 6 feet 6 inches high, is placed in a niche over the entrance doorway. The tower is built of Portland stone, resting on a concrete foundation 30 feet square, while the base of the tower is formed of polished Aberdeen granite steps.

Salford and Maternity Centres.

The health committee of Salford has asked the council to adopt a resolution similar to the following passed by the St. Helens corporation:—

> That in the opinion of this council it is vital to the public health of the country that all schemes dealing with infant mortality and child welfare should be administered by the constituted sanitary authorities under the direction of the Local Government Board; and that the time has arrived when adequate grants should be made to those authorities to enable them to establish maternity centres and similar institutions dealing with the care of infant life.

Defective Sight in School Children.

From the last report of the school medical officer, Dr. A. Brown Ritchie, it appears that six medical men along with a number of nurses devote all their time to health matters in connexion with 185 schools in Manchester. By the new arrangements each child will be examined three times in the course of its school career. There is an improvement in the attitude of parents towards the provision of spectacles, though there are still a fairly large number of parents who require considerable pressure before they provide the spectacles necessary. Teachers take a keen interest in detecting cases of defective vision.

Memorial to the late Mr. T. H. Pinder.

A fund has been started for a memorial to the late Mr. T. H. Pinder, who for many years was connected with the Hospital for Diseases of the Ear. It has not yet been decided what form the memorial will take. A subcommittee has been appointed to confer with the hospital committee.

June 30th.

IRELAND.

Death of Mr. F. T. P. Newell, M.B.Dub., F.R.C.S.Irel.

I RECORD with regret the death, at the comparatively early age of 54, of Mr. Newell, a well-known Dublin practitioner. He had been suffering for some months past from a tumour of the neck, and the end came last week as the result of hæmorrhage. For more than 20 years Mr. Newell was a Poor-law dispensary officer in one of the city districts. For the past three or four years he was a member of the Council of the Royal College of Surgeons, and was regarded as the representative of the general practitioners on that body. During the professional struggles of the past three years his presence on the Council was of special value both to the College and to the general body of the profession, and it was in large measure due to his influence that the Council adopted a strong attitude in regard to conduct in the administration of the National Insurance Act which might be regarded as unprofessional. Mr. Newell was one of the most active members of the Dublin Local Medical Committee, and he was also a member of the Irish Medical Committee. He was an upright man, much respected both by his colleagues and the public, and held in warm affection by those who knew him best.

Belfast District Lunatic Asylum.

From the annual report for 1913 of this asylum it appears that there were 276 admissions, while 148 were discharged and 145 died. On Dec. 31st, 1913, there were 1232 inmates, 598 males and 634 females. Of those admitted, eight were over 70 years of age. The gross expenditure for the financial year ended March 31st, 1914, was £29,946 5*s.* 10*d.* More than two-thirds of the patients are now in the new colony at Purdysburn, and the remainder—with the exception of 37 at Ballymena—are in the old buildings at Grosvenor-road, Belfast.

Laurelvale Water-supply.

The Local Government Board have sent a sealed order to the Tandragee rural council, county Armagh, stating that whereas complaint had been made to them that the council had made default in providing a proper supply in Laurelvale—a district where there is an industrial population—they directed that the council shall set about the performance of their duty in the matter within a period of three months. It was decided by the Tandragee rural council to engage a civil engineer to report on the question, and a subcommittee was appointed to consult with him. For a long period this matter of the water-supply of Laurelvale has been in dispute, and typhoid has occurred at times owing, it is alleged, to the impure water from wells. It is quite time the people in the area had a reliable supply of pure water.

June 30th.

PARIS.

Students' Grievances.

THE new régime for medical studies has been in operation since November, and the first year's examinations have just taken place. The students complain of unwonted severity on the part of the examiners, and the number of rejected is certainly much greater than ever before. It would be hard to assert that the examiners have exercised intentionally undue rigor, particularly as the medical syndicates have often proclaimed that the examinations should be searching especially at the beginning of medical study, so as to eliminate promptly those students who do not show any real aptitude and so would only encumber the profession. Once a student has fully entered on his studies and has passed with greater or less effort his first examinations, he is almost certain to complete them after a longer or shorter time, for in the end the examiners are merciful to a candidate who perseveres in spite of frequent rejection. It is possible that this consideration has led them to exercise a selective faculty at the beginning of the course, in cases where a real vocation or its absence is clearly indicated. The Coöperative Association of Medical Students, however, is dismayed at the disastrous results, and has called on the doyen of the Faculty of Medicine to complain of this unwonted severity. It even asserts that the examiners have imposed on the candidates questions that ought not to be admitted in the first year. The doyen could only reply that he would consider the points raised and urge upon the students to work with greater energy, so as to raise the entire level of medical study.

An Aeroplane Ambulance.

At the great military manœuvres of last year attempts were made to use aviators in searching for the wounded after a battle. The results were very good, and many wounded were undoubtedly discovered who would have remained a much longer time without assistance under ordinary methods. Dr. Raymond, who is a Senator and himself an aviator of considerable ability, made these attempts with marked success. And now a woman aviator, Mdlle. Marvingt, has extended this idea by having a special aeroplane constructed to accommodate, besides the aviator, a medical man and also a covered litter on which the wounded man can be placed for transport. To collect the necessary sum of 36.000 francs for the construction of this apparatus she has arranged aviation meetings and conferences throughout France, the proceeds of which are to be devoted to this work, and has collected already some 21,000 francs. She thinks that this aeroplane ambulance will be of service, not only in a European war in which battles finish only with nightfall and so render a search by aeroplane very difficult, but in colonial wars also, in which many wounded run the risk of being left in the desert, hidden by the inequalities of the land which impede observation in the case of those on foot, but are easy of survey from above. It is true that landing presents peculiar difficulty in these conditions, and it is hardly likely that this new method of aid to the wounded can become general. But the effort is charitable and worthy of all sympathy.

Antityphoid Inoculation made Compulsory in the Army.

The principle of compulsion in regard to antityphoid inoculation in the army was affirmed by Parliament in a law dated March 28th. A ministerial order has now laid down the conditions of its application. All officers and men of troops quartered in regions where the appearance of typhoid fever may reasonably be looked for, from former or recent experience, must be immediately inoculated. Garrisons in which the typhoid mortality during the past five years has exceeded an average of 2·87 per 1000 are so qualified. All white troops in Algeria, Tunis, and Morocco, and all soldiers under orders to serve in Morocco, must also be inoculated. The last class will not be allowed to proceed there until they shall have undergone the complete series of preventive inoculations. All military nurses must be inoculated immediately when individual contra-indications do not exist. Troops also about to manœuvre in districts where typhoid fever has recently been prevalent among the civil population must be inoculated. Finally, on October 1st this year all soldiers with the colours who do not belong to any of the preceding categories must be inoculated, beginning with the new recruits. All these orders must have been complied with by Dec. 1st. The Minister, having regard to the observations laid before the Senate during the discussion on the Bill, has conceded that the military medical officer shall always have the power to exempt temporarily from inoculation any one whose state of health for any reason shall appear to render the operation especially risky.

June 29th.

BERLIN.

Removal of Injurious Micro-organisms from Vaccine Lymph.

Dr. Friedberger recently read a paper before the Berlin Medical Society on the "sterilisation" of vaccine lymph by means of the ultra-violet rays. He said that a satisfactory method of removing extraneous microbes from vaccine lymph had not until now been discovered, because chemical germicides necessarily diminished the prophylactic efficacy of the lymph. This was also the case with glycerinated lymph, the addition of glycerine producing only a very slow decrease of virulent germs, so that this lymph could not be used in a fresh condition, and much of its activity was sacrificed. He had therefore endeavoured to find some method which would destroy the virulent bacteria without tedious delay and without impairing the valuable properties peculiar to the lymph. Ultimately, in conjunction with Dr. Mironescu, he discovered that the ultra-violet rays produced the effect desired. Exposure to the radiation emitted by a Kromayer lamp for 20 or 30 minutes destroyed the bacteria present in fresh vaccine lymph, the latter remaining efficacious even when the exposure to the rays was continued for one or two hours. When spores of the bacillus anthracis and of the bacillus subtilis were intentionally added to the vaccine lymph the result was that a considerable time was necessary for the destruction of those organisms, but the lymph was still efficacious for vaccination, although its activity was lessened.

A New Method of Testing the Strength of the Heart.

At a recent meeting of the Berlin Society for Internal Medicine Professor Katzenstein read a paper on a new method of testing the strength of the heart. The characteristic feature of his procedure is that he ascertains the number of the beats and the blood pressure before and after a compression of both crural arteries. When the strength of the heart is sufficient the number of the beats decreases, and the blood pressure increases after the compression. In slight insufficiency both remain unaltered, and in severe insufficiency the number of beats increases whilst the blood pressure is sinking. This method has proved valuable in many cases. It may also be used for ascertaining any damage done to the heart by narcotic compounds. When the test gives an unfavourable result general anæsthesia is contra-indicated for such patients, and only local anæsthesia ought to be employed. In nervous patients, however, the method is not reliable.

The Law Relative to Agreements Restraining Medical Men from Practice.

An important judgment was recently given by the Supreme Court of Justice in Leipzic. On the occasion of a medical strike a medical man had accepted an appointment at a sick club the medical officers of which had resigned. The Leipziger

Verband then induced him to leave his appointment by paying him 6000 marks (£300) on condition that he not only resigned this appointment but also pledged himself not to settle as a medical practitioner in Germany for the ensuing ten years without the consent of the Leipziger Verband. He did not keep this agreement, and the Leipziger Verband accordingly brought an action against him for the repayment of the money which he had received. The Supreme Court, however, in its final judgment declared that an agreement by which the right of settlement was limited by or made dependent upon the goodwill of another person was against the law, and therefore incapable of being enforced. This decision will very much hinder the action of the Leipziger Verband, because when the medical officers of a sick club resign in a body on account of some grievance and the club managers appoint substitutes it will in future be impossible to restrain the latter by money payments.

Accidental Loss of a Quantity of Radium.

A private sanatorium in Berlin has recently sustained a heavy loss by the negligence of a servant. One of the medical men attending patients in the sanatorium had applied radium of the value of 20,000 marks (£1000) to a patient. It was enclosed in a small capsule, and when the application was discontinued the capsule was put in a basin which was afterwards cleaned by a servant. The man did not know what the capsule was, and after cleaning the basin he poured the water, together with the capsule, into a sink, from which it ran into the sewer. The loss of the valuable material became known only after the lapse of some hours, and although the sewers were searched for several hours by a number of workmen and a reward of 2000 marks was promised, the valuable little capsule was not found.

June 29th.

UNITED STATES OF AMERICA.

Yale Medical School.

Yale University has received the sum of $125,000 (£25,000) for the erection and equipment of a chemical and pathological laboratory to be known as the Anthony Brady Memorial Laboratory. The announcement has also been made that members of the Brady family will establish the Anthony N. Brady Memorial Foundation of $500,000, the income of which is to be given annually to the University for a term of ten years, in order to enable the University to declare operative at the time the agreement with the General Hospital Society of Connecticut, and to conclude the alliance between the New Haven Hospital and the Medical School of Yale University. If within the ten-year period the University receives a total of $2,000,000 for medical school endowment the $500,000 will become the absolute property of the University. Over $1,110,000 have already been promised, and if $390,000 more are obtained before Jan. 1st, 1915, the General Education Board will give the $500,000 necessary to make up the $2,000,000.

Fund for Johns Hopkins University Medical School.

Mr. Abraham Flexner, of New York, representing the General Education Board founded by Mr. John D. Rockefeller, has made recently final arrangements to turn over to the Johns Hopkins University Medical School the sum of $1,500,000 to establish the William H. Welch Endowment for Clinical Education and Research. The Johns Hopkins Medical School is the first medical institution in the United States to receive money for research work from the General Education Board.

Diagnosis of Cancer.

At a meeting of the executive committee of the American Society for the Control of Cancer held recently the following resolution was adopted:—

> That it is the belief of the executive committee that the City of New York should undertake free diagnosis of specimens of tissue suspected of being cancerous.

It is stated that the New York Department of Health now has the question under consideration and will consult with its Medical Advisory Board before taking action.

The Coroner's Office in New York City.

The recent trial of a coroner in New York City for neglect of duty may lead to the abolition of the ancient office. An investigation of the department by the Commissioner of Accounts has been ordered by the Mayor of New York at the request of the City Club, and as a result the need for an independent official investigation is urged, because of the serious charges made affecting the efficiency and integrity of the performance of the coroner's function in the city.

Street Accidents in New York City.

The National Highways Protective Society has reported that during the month of May 45 persons were killed by vehicle traffic in the streets of New York. Thirty-two of those thus killed, or more than 70 per cent., were less than 16 years of age. During the month of April 5352 accidents occurred on the railroads and street railways under the jurisdiction of the Public Service Commission of New York. As a result of these accidents there were 26 deaths, as compared with 17 in April, 1913, and 22 in April, 1912. In addition 9 persons had their skulls fractured, 3 lost an arm or leg, and 142 were injured seriously.

A False Alarm.

Dispatches from Bogota state that it has been determined by bacteriological tests that the epidemic now prevailing in Colombia is not bubonic plague.

June 25th.

CHINA.

The Health of Shanghai in 1913.

THE annual report of the health department of the Shanghai municipal council, written by Dr. A. Stanley, the medical officer of health, is of value, as it concerns the only place in China where definite statistics are available to indicate the prevalence of diseases both among foreigners and Chinese. Within the area of the municipal limits (8⅔ square miles) there is a population of 14,250 foreigners and 510,000 Chinese. The death-rate among the former was 21·5 per 1000 and 15·8 for the Chinese. But it is noted that 135 of the 305 deaths recorded among foreign residents were Japanese, and that 21 of these were due to beri-beri, which rarely affects non-Asiatics. Instead of the term "non-Asiatic" one might put "non-rice-eaters," but this view, so generally accepted, does not find favour with Dr. Stanley, who still remains, by the evidence he gets in Shanghai, in favour of the opinion that beri-beri is an infective disease "having no relation to food, but infective through body vermin." A diminution in the number of cases of this disease in the municipal gaol is held to be attributable to the measures of disinfestation of body vermin among the convicts. The incidence of small-pox, typhoid fever, dysentery, tuberculosis, and scarlet fever was abnormally high. As regards scarlet fever an unfortunate factor is the extreme virulence of the infection met with in China, it being more than four times as deadly as it is in England, and there is no indication yet of a decrease in virulence. Although scarlet fever has hitherto failed to establish itself firmly in any part of Asia excepting Asia Minor, and is practically unknown in the tropics, it appears to have come to Shanghai to stay, since its introduction in 1900, probably by foreign immigrants. As would be expected with a recently introduced disease, against which evolution has afforded no natural immunity, scarlet fever has been of a virulent type among the Chinese. It is probable that the passage of the disease through the susceptible Chinese has led to an intensification of the virus, so that it is more fatal to foreigners also. There were 12 non-Chinese and 207 Chinese deaths from small-pox. In Shanghai there exists so much small-pox infection that it is advised that vaccination should be repeated every three years till it no longer takes. Over 13,000 free vaccinations were provided by the Health Office during the year under review. No city in the world is probably so favourably served as Shanghai in the disposal of refuse. Over 150,000 tons of garbage and ashes have to be removed yearly from houses in the settlement, and this is done at a very low cost. Cement bins with iron lids and doors are fixed at suitable points in all the alleys. They are both rat and fly proof, and help to minimise the fly nuisance. The former horse carts have been replaced by a small army of scavenging coolies with wheelbarrows who are able to pass practically anywhere. As a result of careful organisation the greater part of the daily mountain of house refuse is now actually a source of profit, being sold to country boatmen who buy it for agricultural purposes. It is, in fact, the cheapest manure available, the average selling price being 5 cents a ton. The cost of collection and disposal was 4½*d.* a ton, compared with 9*s.* the cost of London refuse. It is probable that the ensuing year may actually show a profit. The prevalence of tuberculosis remains at the same high level; it is the most fatal disease, among foreigners and Chinese alike, in Shanghai. A scheme is on foot for the establishment of a tuberculosis dispensary on lines of treatment which will be preventive, educative, and curative. Plague: During 1913, 13,333 rats were found dead, and of these 122 were plague infected, while nearly 153,000 rats were trapped and burnt. An active campaign of making houses rat proof is kept up, and in addition to 5875 houses dealt with in this way all food shops are now required to be rat proof as one of the conditions of licence. Nine cases of human plague with eight deaths occurred. It is considered that by these active rat-proofing measures a serious outbreak has been averted. Close on six million phosphorus baits were laid. Rabies: 41 persons underwent Pasteur antirabic treatment during the year, in 24 of which the animals responsible were proved rabid by inoculation. Two cases died subsequently from hydrophobia, one four days and the other ten days after the completion of treatment—i.e., before its effects were fully established. They had both been severely bitten. Dysentery: There was an increased prevalence of this disease during the latter part of summer. Most of the cases were amœbic in origin, and yielded to the new emetine treatment. Two deaths occurred from liver abscess among foreign residents. Bacillary dysentery was also noted.

Plague in South China.

The most rigorous regulations for the medical inspection of ships entering Shanghai from the South are at present being imposed. The outbreak of plague in Hong-Kong, serious though it is, is nothing like so dangerous to other ports as the epidemic in Canton. Bubonic plague with a high degree of virulence has been spreading over Kuangtung province, of which Canton is the capital, and the conditions there are very bad. The mortality approaches 100 per cent. The percentage of deaths from bubonic plague in South China has never been below 88·4. The plague return for the week ending May 19th in Hong-Kong shows that 241 cases were reported, and 185 deaths. For the past three weeks the number of cases of plague has exceeded those in any week for several years. In the previous week there were 215 cases and 173 deaths, while three weeks ago the returns were 203 reported cases, of which 171 were fatal. The total number of cases in Hong-Kong alone since the beginning of the year is 1474 and 1301 deaths. Since 1894, when the colony was first declared infected, each succeeding year has seen a recurrence of the disease, and since 1899 the heaviest death-rolls have been 1486 in 1899, 1651 in 1901, 1700 in 1912, and 1301 to May 19th in 1914. All these years the Hong-Kong Government has been strenuously endeavouring to eradicate plague, and leaves no stone unturned by means of its active and well-directed sanitary staff to limit infection. But a baffling feature with which the whole life of the colony is bound up is the constant coming and going of Chinese to and from the mainland in native craft, which are innumerable and very difficult to control.

The Rockefeller Foundation.

The trustees of this fund have long been interested in China, and especially in medical education in China, and this spring have sent a commission consisting of Mr. H. P. Judson, President of Chicago University, Dr. F. W. Peabody, of Boston, and Mr. R. S. Greene, United States Consul-General at Hankow, to make a study of the actual conditions surrounding medical education and report to the Foundation. This commission has been in Peking engaged in investigation, and has now left for the Yangtze Valley, where they will visit Hankow, Nanking, Changsha, Shanghai, and other important centres. The foundation is incorporated by the State of New York, and there is a sum of 100,000,000 gold dollars in the hands of the trustees, which by the terms of its charter is to be used "for the welfare of humanity." The members of the commission are examining very thoroughly into the actual amount of work done in each college with a view to the proper allotment of grants in aid, which is the form of help to be given, thus allowing existing institutions to select their own additional teachers and extend their equipment.

Medical Education in China.

At the present time a good deal of discussion is taking place in Far Eastern circles over the reported forward movement by Germany to establish her language and ideals in China to a much greater extent than has hitherto been the case. In Berlin the Reichstag in April, 1913, voted £1000 more than in former years for the establishment of German educational centres in China, and a new German-China institute has been established to bring the scientific and technical achievements of Germany to the knowledge of the Chinese people. These aims will be effected especially by the establishment and maintenance of Sino-German schools, medical, technical, and commercial, and also Sino-German sanatoriums, and by supplying German teachers to Chinese schools. As far as medical schools are concerned there are now in Shanghai and Tsingtao two subsidised colleges where a five years' course of medicine is given, with German as the teaching medium. Both these colleges have preparatory schools attached, where a thorough grounding in that language can be made before entering on the medical course. Although the British Government has not yet seen its way to extend official financial support to the educational efforts of British medical missionaries, the movement, nevertheless, in conjunction with their American *confrères* is in a healthy condition. In fact, there is every reason to be proud of the splendid sustained efforts being made by medical missionaries to establish scientific medicine in China. In all large towns the work of foreign doctors and missionaries is gradually creating a demand on the part of the Chinese for more efficacious treatment than they can get from their native empirics. Two new colleges with hospitals attached have recently been opened. In Manchuria the Mukden Medical College, which owes its existence to the fine work of the veteran missionary Dr. Dugald Christie, C.M.G., has had an extension opened by the Governor of Fengtien, H.E. Chang Hsi Man. The college has 80 students, and in addition to a fairly good educational equipment offers excellent clinical teaching by means of its hospital, which last year dealt with 47,000 out-patient visits and 2380 operations. A new feature is an X ray department, a gift from General Chang Tso-lin, the commander of the army in Manchuria. At the last entrance examination 157 candidates came forward, of whom only 40 could be admitted. This is a healthy condition of things educationally, as it ensures a high standard in those who enter. The other institution, the Tsinan-fu Medical College, formed by a union of the English Baptist and American Presbyterian Missions, has just had the foundation stone of its new hospital laid by H.E. Chin, the Military Governor of Shantung Province. Friends in England, mainly by the exertion of Mr. Harold Balme, subscribed a sum of £6000 for the erection of the hospital which, in addition to a central administrative block and a large out-patient department, fitted with five consulting-rooms and two operating theatres, will have accommodation for 100 beds in modern wards. As a sign of advance in the times I might add that the Chinese Central Government has issued regulations officially permitting human anatomy and post-mortem examinations, and that this is no mere paper affair is shown by the fact that the Peking Union Medical College has received from the local prison authorities unclaimed bodies of dead prisoners for dissection.

Peking, May 27th.

DONATIONS AND BEQUESTS.—By will the late Mr. Francis James Trewent, of Hampstead, N.W., left £1000 to a London hospital for patients suffering from paralysis, and £1000 to the Hampstead General Hospital, Haverstock-hill.—Under the will of the late Mrs. Jane Pitt, of Ullswater, the Royal Infirmary, Liverpool, will receive £500 and the Carlisle Infirmary £250.

Correspondence.

"Audi alteram partem."

THE MENTAL DEFICIENCY ACT.

To the Editor of THE LANCET.

SIR,—It seems, from the remark of Mr. Wallace, K.C., and from the letter of Sir Bryan Donkin in THE LANCET of June 20th, that a person who is mentally deficient is not mentally deficient within the meaning of the Mental Deficiency Act unless his whole history from birth or from an early age can be had. I do not know whether this has been so held by any court of competent jurisdiction, but I venture to assert that it is not only calculated to nullify much of the benefit of the Act, and to remove out of its scope many of those who ought to be within it, and who were intended to be within it, but also that it is not a necessary interpretation of the Act, and that the Act may and ought to be so construed as to escape such a futile result. I am the more concerned to show this since I am largely responsible for the definitions in the Act, each of which requires that the persons defined shall have suffered from defect from an early age, and all but one require that he shall have suffered from birth.

From this it has been inferred, so it now seems, that unless the whole career of the person is known, and his defect can be traced back in his history to an early age or to birth, the definition is not satisfied. The contention seems to me absurd. Take the frequent case of a person who suffers from congenital hemiplegia, with contracture, infantile undevelopment, and choreiform spasm of one arm and leg. The state of the limbs renders it certain on inspection of them that the physical deficiency dates from birth or from an early age; and no information from the mother, no written record of the person's history, could possibly increase our certainty that it does so date. The nature of the bodily deformity and deficiency is itself conclusive of its own inveteracy, and its existence from birth or from an early age; and so it is with many cases of deformity and deficiency of mind. When we observe certain mental defects we know at once, without investigating the history of the patient, that these defects have existed from birth or from an early age, and we no more need to investigate the history in order to determine the point, than we need to investigate the history of a red-haired person in order to determine whether the redness of his hair existed from birth or from an early age, or whether it was not brought on by profligacy and evil living.

If we can say that a person is mentally deficient, and that the deficiency is of a kind that we know by experience is inveterate, and is part of the original equipment of that person, then I maintain he is mentally deficient within the meaning of the Mental Deficiency Act.

I am, Sir, yours faithfully,

CHAS. A. MERCIER.

June 25th, 1914.

THE SOCIETY OF MEMBERS OF THE ROYAL COLLEGE OF SURGEONS.

To the Editor of THE LANCET.

SIR,—I have just received a circular from the Society of Members of the Royal College of Surgeons of England asking me to vote for certain candidates—a rather belated request—at the election to the Council on Thursday next. This request is based upon the fact that these candidates have pledged themselves if elected to support the claims of the Members for an active participation in the government of the College. The circular also includes the following remarkable paragraph:—"To govern a great college there is needed a body of men of wide and comprehensive intelligence. To secure a council of such men we must *avoid those persons whose only idea is to glorify their own existence and to remain deaf to all suggestions for improving the College administration* [the italics are mine], and who refuse to adopt the only course which will help to make the College of Surgeons a real power for inspiring surgical knowledge and for protecting and guarding surgical practitioners."

Could anything have been conceived in worse taste, more impolitic, or more harmful to the Members' cause than this virulent expression of feeling? There is a flavour about it of the militant tactics of those insane women known as suffragettes. It has always been the policy of the Members' association to pour vials of vituperation upon the Council. Surely, the past has shown unequivocally the worthlessness of the proceeding. What has been gained by this policy? Nothing save, perhaps, the alienation of many Fellows who otherwise, at least in part, would be willing to show active sympathy with the Members and their claims. When will the Society of Members realise that to proceed on strictly constitutional lines is the only means by which the Members can hope to gain adherents to their cause among the Fellows? Meanwhile this last ebullition of feeling against the Council will only have the effect of destroying the chances of success of those candidates for whom the Society of Members have appealed for votes.

I am, Sir, yours faithfully,

Wimpole-street, W., June 29th, 1914. PERCY DUNN.

SOME POINTS IN THE MANAGEMENT OF TRACHOMA.

To the Editor of THE LANCET.

SIR,—It may be of interest to record certain experiences in connexion with the management of trachoma in the Poor-law schools under the administration of the Westminster Diocesan Education Fund.

The authorities of the fund have two methods of dealing with this disease: (1) inspection, and (2) isolation in special schools. Under the first head 13 schools are inspected twice a year, and approximately 2200 children examined. The lids of every child are everted with a view to detecting any cases of trachoma or contagious ophthalmia. Any case of trachoma is drafted off to a special school for isolation and treatment. It is difficult to arrive at the percentage of trachoma in Poor-law schools, but I am convinced that a periodical and systematic inspection has a very marked effect in keeping down the number of trachoma cases. Stephenson's census, taken in 1896, when 13,047 children were inspected, gives a percentage of 4·91 trachoma cases. In my last inspection (I found approximately ½ per cent. of the children had trachoma on the previous inspection) I found 22 cases of trachoma—i.e., 1 per cent. Six of these cases were found in one school where there had previously been trachoma, and seven were found in one of the smaller schools, and had nearly all been admitted within the last few months. I may add that the children of these schools are drawn from the very poorest class, and a large percentage are of Irish parentage.

Secondly, with regard to ophthalmic isolation schools, the fund has such schools, one for girls and one for boys, at Chigwell. In the latter school I had last year on an average 240 boys under my care. One difficulty which may from time to time confront the surgeon in charge of such a school is a sudden inroad of cases, which the ordinary accommodation is not sufficient to meet. Such a situation arose at Chigwell on three occasions—namely, the summers of 1910, 1911, and 1912. In each year I had a number of boys put under canvas. The spot selected was a sloping field adjoining the school. The soil was gravel and the aspect west. In 1910 and 1911 30 cases were dealt with in this way. The tents were of the ordinary army bell-tent pattern, with boards. Six boys slept in each tent. There was a man in charge at night, whose duty it was also to see that the bedding was folded and the flies of the tents rolled up in the daytime. There was a lavatory adjacent to the tents, where the boys washed in running water and had access to the spray bath, as did the boys in the school buildings. Each boy had his numbered towel, &c. There was sufficient accommodation in the school for all the boys to attend classes, receive treatment, and have meals together.

In 1912 the numbers under canvas varied from a minimum of 100 to 120. This large increase was due to the fact that 87 boys had to be admitted in one month. The boys were accommodated in two large marquees. No boards were employed, but each boy had a mackintosh sheet under his bedding. A small gutter was cut round the higher side of the tent to carry off water. This year the boys were out from July to the end of October. It is interesting to recall that 1910 was a fairly average summer, 1911 was the year of drought, and 1912 was equally exceptional in the opposite respect. The type of season does not seem to have affected the welfare of the boys. In no year was it necessary to bring any boy in on account of rheumatism or chill. In 1912 there was scarlet fever in the school. Three or four of the boys under canvas became affected, and were, of course, removed to a fever hospital. In 1912 record was kept of the weights of the boys before and after their open-air sojourn. They all increased in weight except one boy, whose weight remained the same. The average increase was 7 to 8 lb. in the four months. One boy increased 28 lb.

On the whole, this method of putting the boys under canvas proved itself a very effective way of dealing with a sudden outbreak of the disease during the summer months. Stephenson, in "Epidemic Ophthalmia," p. 61, suggests that this method might be used, the tents being pitched upon a wooden or asphalt flooring. He cites two instances of epidemics having been treated in this way—namely, at the St. Petersburg Military Hospital in 1835 and 1839, under Florio, and in 1872 at the St. Stanislaus Asylum, Nancy. Boldt, in his book on trachoma, states "that if an epidemic of trachoma broke out at the seat of war, where there was satisfactory accommodation," he "would consider it imperative to treat the milder cases in tents or portable barracks, such as are, indeed, ordered for use in the treatment of epidemics on active service."

In order to meet any further epidemic the managers of the school at Chigwell have erected so-called "temporary" buildings to accommodate

120 boys in the same field where the tents were pitched. They consist of dormitories, class-rooms, lavatory, and recreation-room. The general construction is, first, cement concrete under the whole of the buildings, and then brickwork foundation walls with a superstructure of timber framing, covered externally with corrugated galvanised sheeting, and lined and ceiled internally with sheets of asbestos set out in panels and painted or distempered. The heating is by means of slow combustion stoves.

Of more special interest are the class-rooms and lavatory. There are four class-rooms, each for 25 scholars (existing class-rooms were able to accommodate the balance of the 120 boys). These are exceptionally well-lighted and cross ventilated, the windows being of a special design (suggested by Dr. Ralph Crowley). The rooms are well warmed by open fires, and large double doors open outwards at ground level, permitting if desired of readily removing the classes to the open playing fields outside. The lavatory building was of experimental and original design, specially constructed with the object of the rapid washing and bathing of the 120 boys, and has proved very successful. The boys enter from the outside straight into the dressing room. Here they strip, then pass under a warm shower into the washing room, which is provided with 40 warm sprays, each having racks for soap and a nail-brush and for three numbered toothbrushes. After washing in this room the boys pass under first a warm and then a cold shower, and into the drying room, fitted with racks for 120 towels and hair-brushes, and then again into the dressing room. The floor of this building is so constructed that it can be readily washed down with buckets of water or a hose-pipe. The attendant who has charge of the washing arrangements informs me that he is able to deal with 100 boys in 45 minutes in this way.

I am indebted to Messrs. Best and Sons, of Victoria-street, for the particulars and plans of the temporary buildings.

I am, Sir, yours faithfully,
J. F. CUNNINGHAM, F.R.C.S.Eng.
Weymouth-street, W., June 30th, 1914.

COLOURED CHLOROFORM AND ETHER.

To the Editor of THE LANCET.

SIR,—There are definite dangers due to the fact that chloroform and ether are similar in appearance and only to be distinguished by their weight and smell. Now so much ether is given by the open method different coloured drop bottles are sometimes used, but that does not prevent chloroform being put into the ether drop bottle by mistake. The greatest danger of all is when chloroform has been by mistake put into a Clover's inhaler. I have heard of two fatal accidents from this, and almost witnessed a third myself. The profession has become accustomed to coloured antiseptics; and provided the colouring reagents are absolutely innocuous to the patient, are permanent, and do not affect the properties of the chloroform and ether, there are many things to be said in their favour in the case of anæsthetics.

At my suggestion, after some months of experimenting, Messrs. Duncan and Flockhart have succeeded in producing a pink chloroform and a green ether, which are perfectly satisfactory and which they are now prepared to dispense if they are asked for them. The mixture of equal parts shows a clear brown. I have exposed them to sunlight for some weeks without them fading, and used them frequently with perfectly satisfactory results. I gave the ether by the open method for over two hours a few days ago, using the same piece of lint, and found it perfectly satisfactory, and have found the pink chloroform equally good.

Mistaking chloroform for ether probably never occurs in hospitals or in the practice of the professional anæsthetist, but surely such a mistake ought to be made absolutely impossible. At times anæsthetics are given in a bad light with indifferent assistants and for an exacting surgeon, who is inclined to flurry the anæsthetist. The green used for the ether is a pure vegetable product, 1 in 1400; the red in the chloroform is an aniline product, 1 in 200,000.—I am, Sir, yours faithfully,

P. F. BARTON, M.A., M.B.Cantab.
Wimbledon, June 25th, 1914.

ORAL SEPSIS.

To the Editor of THE LANCET.

SIR,—Dr. Robert Hutchison in his reply to Dr. Sim Wallace in THE LANCET of June 13th (p. 1721), suggests, as a small contribution to a discussion on "oral sepsis," that the pathological consequences of oral sepsis tend at present "to be greatly exaggerated." I am glad to notice that Dr. Hutchison is careful on this occasion only to make a suggestion, and that he has not, in his usual refreshing though rather dogmatic manner, made a definite assertion. May I also make a small contribution to this discussion?

During last season, as one of the physicians to the Royal Bath Hospital, I had under my care 261 cases, which I classified under the following groups: Chronic arthritis, muscular rheumatism or fibrositis, subacute rheumatism, neuritis, skin diseases, and miscellaneous.

The cases of chronic arthritis I attempted to subdivide into the following: Proliferative polyarticular or infective arthritis; degenerative or osteo-arthritis; articular gout; true rheumatoid arthritis, or metabolic osteo-arthritis (Nathan); chronic villous arthritis; and unclassified cases. Now in all these cases I carefully examined the mouth for evidence of oral sepsis, such as decayed teeth, swollen and inflamed gums, pyorrhœa and septic conditions of the tonsils. The arrangements at the hospital at present do not permit of bacteriological examinations, but the evidence of even such perfunctory examination as I carried out is worthy, I think, of Dr. Hutchison's attention. The percentage of oral sepsis in these cases may be seen from the following table:—

	Number of cases.		Oral sepsis.
Chronic arthritis:—			
1. Proliferative polyarticular arthritis	56	...	33
2. Degenerative or osteo-arthritis ...	42	...	10
3. Articular gout	5	...	1
4. Rheumatoid arthritis, or metabolic osteo-arthritis	3	...	None.
5. Chronic villous arthritis	9	...	2
6. Unclassified cases of arthritis ...	10	...	5
Muscular rheumatism or fibrositis	56	...	13
Subacute rheumatism	15	...	6
Neuritis	19	...	3
Skin diseases	36	...	2
Miscellaneous	10	...	3

Thus we see that out of a total of 261 cases admitted 83 suffered from some form of oral sepsis, and what is particularly noteworthy and almost startling is the fact that in the subdivision proliferative polyarticular, which we recognise as infective, 67 per cent. had oral sepsis. I do not wish for a moment to deny that there were not other forms of sepsis present, such as leucorrhœa, gonorrhœa, but the percentage of these was small in comparison.

I feel convinced that if the general practitioner would send these cases to the dentist when they first come under his notice instead of dosing them with salicylates and aspirin, we should soon see fewer of these distressing cases of severe crippling which are so common at all our spas, but the cases must be seen early and before the damage is done.

I am, Sir, yours faithfully,
Harrogate, June 20th, 1914. G. L. KERR PRINGLE.

INTRACRANIAL INJECTIONS OF SALVARSANISED SERUM IN PARENCHYMATOUS SYPHILIS OF THE CENTRAL NERVOUS SYSTEM.

To the Editor of THE LANCET.

SIR,—I have read with great interest the article in THE LANCET of May 30th written by Mr. Ballance on the introduction of salvarsanised serum into the lateral ventricle, and I am much impressed with this ingenious method. I understand, however, that Mr. Ballance would consider an injection into the subdural space over the hemisphere of at least equal value, and that he has given this method up only because he found it was difficult to inject a sufficient quantity of serum into the subdural space. Now I have myself in a few cases of general paralysis (six cases up to now) injected salvarsanised serum intracranially, and my experience is that it is not only possible but very easy to introduce as much as 30 c.c. in the subdural space without any subsequent leaking out of the injected fluid.

I shall as briefly as possible describe the method I have employed. With a ½-inch trephine I make an opening in the skull about 10 cm. above the anterior end of the left zygomatic arch, just behind the border of the hair. I then puncture the dura obliquely with a fine hollow needle, and when the cerebro-spinal fluid trickles out I fix a record syringe on to the needle and inject slowly 30 c.c. I then raise the patient to a sitting position and stitch up the wound. I do it all with local anæsthesia. It will generally be sufficient to inject about 5 c.c. of a 1 per cent. solution of novocaine in the soft parts that cover the skull. One only needs a small flap for the trephining. The bone itself is insensitive. Half an hour before the operation I give ¼ gr. morphia hypodermically, and I regard this as essential in order to keep the patient quiet during the operation. When the patient, after the injection, is raised to the sitting position it will generally be found that there is no leakage worth mentioning. I leave the trephine aperture open for subsequent injections, and it has proved to be very easy to puncture again through the old trephine opening; one has only carefully and slowly to push the needle in till the cerebro-spinal fluid trickles out, and then inject.

I do not think it necessary to remove any cerebro-spinal fluid before the injection; at least, I have not had any pressure phenomena after the injections and I have never removed more than 2–5 c.c. cerebro-spinal fluid before injecting. In the accompanying diagram I have tried roughly to indicate the localisation of the flap and the trephine opening. I suppose one might equally well trephine on the right side (in a case of left epileptiform attacks this would probably be preferable) or on any other part of the convexity of the skull; only I have chosen this site for trephining because of the situation of the eupractic regions on the left side and chiefly because of the ease with which trephining can be performed in this region. There is no muscular cover, one is well in front of the anterior branch of the meningeal artery, and also at a safe distance from the sinus sagittalis superior. The skull is rather thick in this region, which is an advantage, as one wants to leave the trephining aperture open for subsequent injections.

I think that this method has several advantages over the intraventricular injection. In the first place it is a much easier operation, and does not require any great surgical skill. Secondly, there is reason to believe that the injected fluid by subdural injection obtains a more direct access to the cerebral cortex than it does by the intraventricular injections.

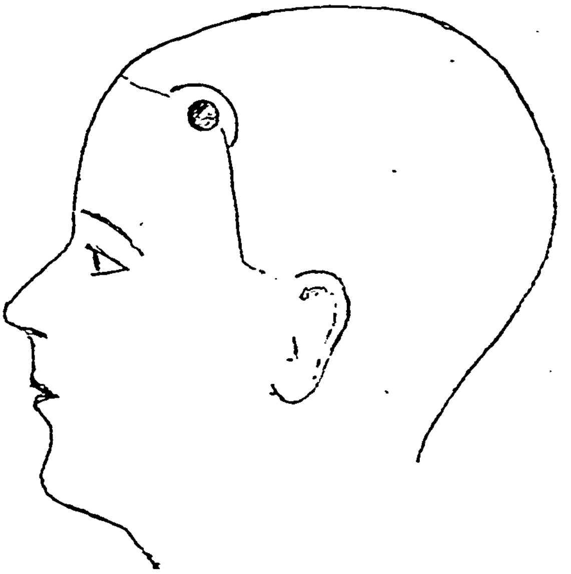

Diagram to show situation of flap and trephine opening.

As far as one can judge from Dr. Golla's experiments (as quoted by Dr. Harry Campbell in his very interesting article in THE LANCET of May 30th), a fluid injected subdurally will readily gain access to the subarachnoid space and the cortex of the brain—and as far as one can judge it will arrive at the cortex in a much less diluted and attenuated form than by intraventricular injection.

It is true one injects rather a small dose of salvarsan by injecting only 30 c.c. serum. After an intravenous injection of 0·6 grm. neosalvarsan (the dose I have generally used) one may say that the blood contains about 0·1 per 1000 neosalvarsan (the entire quantity of blood being about 6 litres), 30 c.c. will consequently only contain 3 mgrm. neosalvarsan, and it seems rational to add more neosalvarsan to the serum. How much one ought to add remains yet to be found out.

Personally I have never added any. Too short a time has elapsed to speak about the results. One thing has always to be borne in mind. Even if one kills ever so many spirochætæ, one cannot create one single new neuron. One may possibly expect a sort of regeneration of neurons which are only slightly damaged, but to expect any great improvement in the objective condition in general paralysis and tabes would be absurd. This new treatment with salvarsanised serum may possibly be able to stop the progress of the disease. Much more than that must not be expected, and therefore early diagnosis is more important than anything else. One must try to stop the disease whilst the patient is still an individual of fairly full value.

I should like to record my best thanks to the members of the honorary medical staff of the hospital for giving me the opportunity of performing these intracranial injections.

I am, Sir, yours faithfully,
G. H. MONRAD-KROHN, M.B., M.R.C.P. Lond., M.R.C.S.,
Resident Medical Officer, Hospital for Epilepsy and Paralysis, Maida Vale, W.
June 8th, 1914.

EVACUATION OF ASCITIC FLUID THROUGH A SLENDER CANNULA.

To the Editor of THE LANCET.

SIR,—In THE LANCET of June 27th, p. 1831, you mention that Dr. Buth, of Berlin, advocates tapping in ascites with a small cannula. In the second edition of my "Therapeutics of the Circulation," published three months ago, I have fully described the advantages of this process and the method of performing it. Dr. Buth's method seems exactly the same as mine, and I have described some additional precautions which I think will be useful in cases where the medical man is obliged to leave the patient for some hours.

I am, Sir, yours faithfully,
LAUDER BRUNTON.
Stratford-place, W., June 29th, 1914.

THE NATIONAL MEDICAL UNION.

To the Editor of THE LANCET.

SIR,—The annual meeting of the National Medical Union took place on June 27th and the dinner followed in the evening.

The representative of THE LANCET, returning thanks for the toast of "The Press," made the remark that the value of such a union depended on unity and numbers. The membership of the union now extends to some hundreds, but to make it a success and a real force in the land it will have to increase to thousands. The principal resolution at the meeting—"That refusal of service in any capacity under the existing National Insurance Acts, 1911 and 1913, be incorporated as a primary principle in the policy of the National Medical Union"—was carried by a large majority, and it was pointed out during the meeting that there were 15,000 non-panel men in the country and 14,000 panel. It was also pointed out that in London only about 1400 men were on the panel out of 6600 names on the Medical Register, and I am informed that even those small numbers are decreased each month by about half a dozen.

A most important resolution was carried *nem. con.* to the effect that either a full-time manager or a part-time officer should be engaged at a salary to put some new life into the union, and it would depend on the guarantee fund which it would be. The fund is not very well supported, and the matter seems to me so important that I will increase my guarantee by 50 per cent. if any other man will do the same.

May I appeal to every non-panel man in the country to join at once this non-panel union? They may be tired of medical politics, but it seems to me that if the profession is not to sink to the level of "underpaid artisans" (your Commissioner for dealing with the working of the Act has stated that this was the remark made to him by a German doctor about the state of the panel men in that country) it is necessary to work for the freedom of the profession and the public; and we can only do this by union and number. But to attempt to unite panel and non-panel men is to my mind hopeless.

I am, Sir, yours faithfully,
E. H. WORTH.
Streatham, S.W., June 29th, 1914.

TOUCHING FOR THE KING'S EVIL.

To the Editor of THE LANCET.

SIR,—The "IAC. 8" touch-piece, to which Dr. F. Parkes Weber alludes in his letter in THE LANCET of June 27th, was among those in the recently dispersed Hodgkin collection. I would suggest that it was struck for use in Scotland, perhaps during the 1715 campaign; otherwise it is hard to see why the Old Pretender should prefer to masquerade as James VIII. of Scotland rather than as James III. of England. I am, Sir, yours faithfully,
RAYMOND CRAWFURD.
London, June 27th, 1914.

THE MEDICAL DEFENCE UNION.

To the Editor of THE LANCET.

SIR,—Having been a member of the Medical Defence Union some 28 years I venture to make some suggestions for the improvement both of the efficiency of the organisation and of the position of the members.

1. That an annual meeting of members be held at which it shall be competent for any member to bring forward motions or to ask questions, and generally discuss the business of the Union transacted during the year under consideration.

2. That an official shorthand reporter shall be present at such meeting aforesaid, and that the usual attendance book shall be signed by members before entering the meeting.

3. That an official report of the proceedings of the same shall be printed and circulated to all members.

4. That the president and council of the Union be elected at the annual meeting in question, the members of council and the ordinary members having equality both in nomination and vote. That the election be by ballot, nomination papers being previously circulated.

I am, Sir, yours faithfully,
DENNIS VINRACE.
London, June 23rd, 1914.

ULTRAMICROSCOPIC VIRUS.

To the Editor of THE LANCET.

SIR,—In an annotation on the Etiology of Mumps in THE LANCET of June 27th, p. 1832, the following sentence occurs: "The investigation affords evidence that mumps is due to an ultramicroscopic virus comparable to that of poliomyelitis."

If the virus is purely chemical in nature it might be ultramicroscopic, but I have always contended that if the virus is due to the growth of a bacterial organism it matters not how minute the individual organisms may be, when they grow, as all bacteria do, in colonies composed of myriads of individuals, such colonies should be easily detected by the microscope. This has been my consistent attitude with regard to the virus, for instance, of poliomyelitis mentioned in the sentence quoted above. Has not Flexner[1] (with the assistance of Noguchi and others at the Rockefeller Institute, New York) succeeded in cultivating and identifying the virus (micro-organism) of poliomyelitis? This has been accomplished on lines similar to that devised by Noguchi for the cultivation of spirochetæ. Two cultivating media are used, and in the second minute colonies are visible, even to the naked eye, clouding the medium. Under the microscope a globular organism is found in pairs, chains, or clusters. We are further informed that by Giemsa's stain the organism can also be demonstrated in infected tissues. The disease has been reproduced experimentally in monkeys.

When once a suitable medium for cultivation and a suitable stain have been discovered, a cultivable organism should in time be recognised, in colonies at any rate.

I am, Sir, yours faithfully,

Norwich, June 28th, 1914. J. T. C. NASH.

AN EXPLANATION.

To the Editor of THE LANCET.

SIR,—In the course of a speech made by me at Leeds in November last and in the press correspondence which ensued thereon in which I dealt with the Insurance Act and the method in which it was being carried out by the medical profession, I felt it my duty to call attention to the conduct of certain doctors in Yorkshire.

It has been pointed out to me that the words I used have been interpreted by certain persons as casting a reflection upon Dr. Walker and Dr. Erhardt of Crosshills, near Keighley, and I willingly take this opportunity of stating that I did not make, and never intended to make, any imputation upon either of these gentlemen.

I would further wish to state that there is, so far as I am aware, no cause for complaint against either of these two gentlemen, who are carrying out the Act loyally and honestly, and I would desire to express sincere regret that any words of mine could possibly have been thought to be applicable to them.—I am, Sir, yours faithfully,

THE NATIONAL INSURANCE ACT.

PROPRIETARY MEDICINES AND THE INSURANCE ACT.

IT is to be observed that a falling off in the sale of the inland revenue stamps applied to proprietary or so-called "patent" medicines, which was stated by Mr. Lloyd George to have taken place and was attributed to the Insurance Act, has not been maintained. The Chancellor of the Exchequer at the same time (in connexion with last year's Budget) spoke of the evidence given before the Select Committee on Proprietary Medicines as a contributing cause of the decline in the trade referred to. Be this as it may, the sale of stamps during the financial year which ended on March 31st was the largest hitherto known, amounting to £360,376, an increase of £32,000 upon the figures of 1912–13. At the same time, however, the rise in the number of licences for the retail sale of these articles has increased but little, and there is no evidence of any connexion between the increased sale of articles to which stamps must be applied and the working of the National Insurance Act. As to this, it seems possible that insured patients, who have before not consulted a medical man, may have done so, and having obtained from him information as to what they are suffering from described in general terms, may have been tempted to make use of such knowledge in order to doctor themselves with advertised "cures" and "remedies"—a regrettable and dangerous course. This seems to be a reasonable explanation, if there is such an increase as that referred to in the sale of preparations strictly of a medicinal character. At the same time it would be interesting to know whether there has not been also a rather marked increase in the sale of proprietary articles which would not take the place of medicines prescribed to insured persons, but which nevertheless are sold under stamps. It may be suggested, for example, that attention drawn to the necessity for taking care of the teeth has caused a large increase in the advertisement, and presumably in the sale of proprietary dental preparations.

salvarsanised serum may possibly be able to stop the progress of the disease. Much more than that must not be expected, and therefore early diagnosis is more important than anything else. One must try to stop the disease whilst the patient is still an individual of fairly full value.

I should like to record my best thanks to the members of the honorary medical staff of the hospital for giving me the opportunity of performing these intracranial injections.

I am, Sir, yours faithfully,
G. H. MONRAD-KROHN, M.B., M.R.C.P. Lond., M.R.C.S.,
Resident Medical Officer, Hospital for Epilepsy and Paralysis, Maida Vale, W.
June 8th, 1914.

EVACUATION OF ASCITIC FLUID THROUGH A SLENDER CANNULA.

To the Editor of THE LANCET.

SIR,—In THE LANCET of June 27th, p. 1831, you mention that Dr. Buth, of Berlin, advocates tapping in ascites with a small cannula. In the second edition of my "Therapeutics of the Circulation," published three months ago, I have fully described the advantages of this process and the method of performing it. Dr. Buth's method seems exactly the same as mine, and I have described some additional precautions which I think will be useful in cases where the medical man is obliged to leave the patient for some hours.

I am, Sir, yours faithfully,
Stratford-place, W., June 29th, 1914. LAUDER BRUNTON.

THE NATIONAL MEDICAL UNION.

To the Editor of THE LANCET.

SIR,—The annual meeting of the National Medical Union took place on June 27th and the dinner followed in the evening.

The representative of THE LANCET, returning thanks for the toast of "The Press," made the remark that the value of such a union depended on unity and numbers. The membership of the union now extends to some hundreds, but to make it a success and a real force in the land it will have to increase to thousands. The principal resolution at the meeting—"That refusal of service in any capacity under the existing National Insurance Acts, 1911 and 1913, be incorporated as a primary principle in the policy of the National Medical Union"—was carried by a large majority, and it was pointed out during the meeting that there were 15,000 non-panel men in the country and 14,000 panel. It was also pointed out that in London only about 1400 men were on the panel out of 6600 names on the Medical Register, and I am informed that even those small numbers are decreased each month by about half a dozen.

A most important resolution was carried *nem. con.* to the effect that either a full-time manager or a part-time officer should be engaged at a salary to put some new life into the union, and it would depend on the guarantee fund which it would be. The fund is not very well supported, and the matter seems to me so important that I will increase my guarantee by 50 per cent. if any other man will do the same.

May I appeal to every non-panel man in the country to join at once this non-panel union? They may be tired of medical politics, but it seems to me that if the profession is not to sink to the level of "underpaid artisans" (your Commissioner for dealing with the working of the Act has stated that this was the remark made to him by a German doctor about the state of the panel men in that country) it is necessary to work for the freedom of the profession and the public; and we can only do this by union and number. But to attempt to unite panel and non-panel men is to my mind hopeless.

I am, Sir, yours faithfully,
Streatham, S.W., June 29th, 1914. E. H. WORTH.

TOUCHING FOR THE KING'S EVIL.

To the Editor of THE LANCET.

SIR,—The "IAC. 8" touch-piece, to which Dr. F. Parkes Weber alludes in his letter in THE LANCET of June 27th, was among those in the recently dispersed Hodgkin collection. I would suggest that it was struck for use in Scotland, perhaps during the 1715 campaign; otherwise it is hard to see why the Old Pretender should prefer to masquerade as James VIII. of Scotland rather than as James III. of England. I am, Sir, yours faithfully,
London, June 27th, 1914. RAYMOND CRAWFURD.

THE MEDICAL DEFENCE UNION.

To the Editor of THE LANCET.

SIR,—Having been a member of the Medical Defence Union some 28 years I venture to make some suggestions for the improvement both of the efficiency of the organisation and of the position of the members.

1. That an annual meeting of members be held at which it shall be competent for any member to bring forward motions or to ask questions, and generally discuss the business of the Union transacted during the year under consideration.
2. That an official shorthand reporter shall be present at such meeting aforesaid, and that the usual attendance book shall be signed by members before entering the meeting.
3. That an official report of the proceedings of the same shall be printed and circulated to all members.
4. That the president and council of the Union be elected at the annual meeting in question, the members of council and the ordinary members having equality both in nomination and vote. That the election be by ballot, nomination papers being previously circulated.

I am, Sir, yours faithfully,
DENNIS VINRACE.
London, June 23rd, 1914.

ULTRAMICROSCOPIC VIRUS.

To the Editor of THE LANCET.

SIR,—In an annotation on the Etiology of Mumps in THE LANCET of June 27th, p. 1832, the following sentence occurs: "The investigation affords evidence that mumps is due to an ultramicroscopic virus comparable to that of poliomyelitis."

If the virus is purely chemical in nature it might be ultramicroscopic, but I have always contended that if the virus is due to the growth of a bacterial organism it matters not how minute the individual organisms may be, when they grow, as all bacteria do, in colonies composed of myriads of individuals such colonies should be easily detected by the microscope. This has been my consistent attitude with regard to the virus, for instance, of poliomyelitis mentioned in the sentence quoted above. Has not Flexner[1] (with the assistance of Noguchi and others at the Rockefeller Institute, New York) succeeded in cultivating and identifying the virus (micro-organism) of poliomyelitis? This has been accomplished on lines similar to that devised by Noguchi for the cultivation of spirochetæ. Two cultivating media are used, and in the second minute colonies are visible, even to the naked eye, clouding the medium. Under the microscope a globular organism is found in pairs, chains, or clusters. We are further informed that by Giemsa's stain the organism can also be demonstrated in infected tissues. The disease has been reproduced experimentally in monkeys.

When once a suitable medium for cultivation and a suitable stain have been discovered, a cultivable organism should in time be recognised, in colonies at any rate.

I am, Sir, yours faithfully,

Norwich, June 26th, 1914. J. T. C. NASH.

AN EXPLANATION.

To the Editor of THE LANCET.

SIR,—In the course of a speech made by me at Leeds in November last and in the press correspondence which ensued thereon in which I dealt with the Insurance Act and the method in which it was being carried out by the medical profession, I felt it my duty to call attention to the conduct of certain doctors in Yorkshire.

It has been pointed out to me that the words I used have been interpreted by certain persons as casting a reflection upon Dr. Walker and Dr. Erhardt of Crosshills, near Keighley, and I willingly take this opportunity of stating that I did not make, and never intended to make, any imputation upon either of these gentlemen.

I would further wish to state that there is, so far as I am aware, no cause for complaint against either of these two gentlemen, who are carrying out the Act loyally and honestly, and I would desire to express sincere regret that any words of mine could possibly have been thought to be applicable to them.—I am, Sir, yours faithfully,

F. HANDEL BOOTH.

THE NATIONAL INSURANCE ACT.

PROPRIETARY MEDICINES AND THE INSURANCE ACT.

IT is to be observed that a falling off in the sale of the inland revenue stamps applied to proprietary or so-called "patent" medicines, which was stated by Mr. Lloyd George to have taken place and was attributed to the Insurance Act, has not been maintained. The Chancellor of the Exchequer at the same time (in connexion with last year's Budget) spoke of the evidence given before the Select Committee on Proprietary Medicines as a contributing cause of the decline in the trade referred to. Be this as it may, the sale of stamps during the financial year which ended on March 31st was the largest hitherto known, amounting to £360,376, an increase of £32,000 upon the figures of 1912–13. At the same time, however, the rise in the number of licences for the retail sale of these articles has increased but little, and there is no evidence of any connexion between the increased sale of articles to which stamps must be applied and the working of the National Insurance Act. As to this, it seems possible that insured patients, who have before not consulted a medical man, may have done so, and having obtained from him information as to what they are suffering from described in general terms, may have been tempted to make use of such knowledge in order to doctor themselves with advertised "cures" and "remedies"—a regrettable and dangerous course. This seems to be a reasonable explanation, if there is such an increase as that referred to in the sale of preparations strictly of a medicinal character. At the same time it would be interesting to know whether there has not been also a rather marked increase in the sale of proprietary articles which would not take the place of medicines prescribed to insured persons, but which nevertheless are sold under stamps. It may be suggested, for example, that attention drawn to the necessity for taking care of the teeth has caused a large increase in the advertisement, and presumably in the sale of proprietary dental preparations.

institution of the first rank, and that these should be under a hospital authority so far as they were maintained by public money. He would have the necessary funds raised by county and borough rates with a Government subvention. Mr. W. G. Carnt, in commenting upon this, assured the meeting that the voluntary system was not a failure at Manchester, where he is superintendent of the Royal Infirmary. He deprecated any departure from the voluntary system. Sir Henry Burdett gave strong support to the maintenance of the voluntary system which, he declared, no Chancellor of the Exchequer alive would ever be strong enough to destroy. He compared the resulting attitude towards the patient under the voluntary system with that obtaining abroad, and declared that he would rather die than live in a country where they had State hospitals. State-aid had always meant that the professor dominated and that humanity suffered, while the one great blessing of the voluntary system was that the first consideration was the patient. Dr. D. J. Mackintosh, speaking of the Western Infirmary, Glasgow, mentioned a falling off there of £123 in the first year under the Act, owing to refusals by insured working men to continue contributing. New subscriptions, however, due to ship-building prosperity had more than made up for this.

THE NATIONAL MEDICAL UNION.

On Saturday, June 27th, there was a well-attended meeting of the National Medical Union, and in the evening a banquet was given at the Café Monico, when a larger concourse of members assembled. Mr. V. T. Greenyer, of Brighton, as chairman of the council of the Union, presided at the dinner, and after the usual loyal toasts Dr. John Playfair, representing the Edinburgh Medical Guild, proposed the toast of the evening, "The National Medical Union." It had originated, he said, at Manchester in 1912 as a local body, but in the course of time and with the help of the honorary secretary, Mr. Robert Carswell, the Manchester Society had united with the Edinburgh Medical Guild and the London non-panel medical societies. The Union thus became, he said, "a central federation of the forces organised to resist the panel and uphold the best traditions of the profession." Alluding to the feeling of the medical profession against the Act, he said that he was agreeably surprised to find that the majority of medical men were not on the panel. In England 11,820 practitioners were on the panel, but 12,976 had refused to join. In Scotland 2151 were not on and 1756 were on the panel. Taking England, Scotland, and Wales together there were 15,663 non-panel and 14,472 panel doctors. Out of 15,000 doctors it should be easy for the Union to recruit a few thousand more members. Dr. Porter and Dr. James Smith, while they pleaded for the cause of individualism, which they said the Insurance Act had sacrificed, also advocated the formation of a strong, well-disciplined Union. Dr. J. Brassey Brierley said that the National Medical Union had come to stay, their members were increasing, and when the time was ripe for a general reconstruction in medical politics the Government would come to them for help. The chairman thought the fact that so many panel doctors felt the necessity of forming themselves into a strong trade union indicated that the Act was not working satisfactorily. Dr. F. J. Smith responded for "The Guests." As a teacher of medicine he thought the Act was doing harm, for though the minority of the panel doctors were doing their best, medical practice was degenerating into a mere money-making business—"profession be damned, I can earn £1000 a year by having 3000 insured persons on my list," was his way of illustrating this phase, adding, "panel practice is a short cut to £400 or £500 a year by asking a given number of people what is the matter with them and giving them prescriptions in duplicate." Dr. Smith was convinced that a large number of panel doctors did not do their work properly, and thought that the medical student, with such examples before him, would learn as little as possible, and ask why he should do more when he could earn a good living without doing it. The banquet concluded with the toast of "The Press," to which Mr. Adolphe Smith, as representing THE LANCET, responded. He referred to the fact that during the last 12 months he had visited places all over the kingdom and interviewed pro-panel and anti-panel practitioners in all centres, and had been received with equal urbanity by either while studying the existing conditions.

ELECTION OF MEDICAL REPRESENTATIVES UPON THE LONDON INSURANCE COMMITTEE.

Ballot papers for the election of medical representatives to serve upon the London Insurance Committee have now been issued to medical practitioners in the County of London by the National Insurance Commission. The election will be carried out according to the system of proportional representation. The following are the duly nominated candidates whose names appear upon the ballot papers, which when filled in must reach the returning officer, 29, Queen Anne's-gate, London, S.W., not later than 12 noon on Monday next, July 6th: R. V. Donnellan, L.R.C.S., Lewisham Park, S.E.; Major Greenwood, M.D., Hackney-road, N.E.; D. Barty King, M.D., Devonshire-street, W.; W. H. F. Oxley, M.R.C.S., East India Dock-road, E.; and Alfred Welply, M.D., Seven Sisters-road, N.

PROVISION OF SHELTERS IN LONDON.

The London Insurance Committee informs the borough councils that the Local Government Board is prepared to make grants towards the cost of providing shelters for the treatment of consumptive patients in the backyards attached to their homes.

WE are asked to state that the successful action of Dr. Alfred Salter against the London Insurance Committee, recorded in our last issue, was carried out on his behalf by the Medical Defence Union.

THE CLINICAL CONGRESS OF SURGEONS.—Mr. A. H. Tubby, for the Royal National Orthopædic Hospital, and Mr. Stephen Mayou, for the Central London Ophthalmic Hospital, have joined the general committee.

THE President and Council of the Royal Society have accepted the offer of Miss L. E. and Miss M. W. Lawrence to present £4000 to the society in trust to devote the interest arising therefrom to the furtherance of research into the cause and cure of disease in man and animals. The donors desire to associate the gift with the memory of their father, Sir William Lawrence, F.R.S., surgeon to St. Bartholomew's Hospital, and their brother Sir Trevor Lawrence, K.C.V.O., treasurer of St. Bartholomew's Hospital.

Medical News.

UNIVERSITY OF OXFORD.—In the undermentioned examinations the following candidates were approved :—

First B.M. Examination.

Organic Chemistry.—J. P. B. Harold, P. S. Houghton, J. E. B. Morton, M. E. Shaw, G. K. Stone, and W. F. Skaite.

Human Anatomy and Human Physiology.—C. W. W. Armstrong, G. Cranstoun, J. L. Dunstan, C. K. J. Hamilton, J. F. Haines, R. M. Humphreys, R. W. Lush, B. G. v. B. Mellé, D. H. Skinner, A. E. Thomas, K. F. D. Waters, and C. D. Wood.

Second B.M. Examination.

Materia Medica and Pharmacology.—H. E. A. Boldero, C. J. A. Buckell, R. W. J. A. Cushing, S. C. Dyke, H. S. Jeffries, O. P. Sells, and C. P. Symonds.

Pathology.—A. C. Ballance, H. E. Bamber, J. B. Batt, H. E. A. Boldero, L. G. Brown, C. J. A. Buckell, C. H. Carlton, F. B. Chavasse, G. Cranstoun, A. W. Dennis, S. C. Dyke, K. M. Dyott, O. H. Gotch, C. H. L. Harper, H. M. Oddy, O. G. Parry-Jones, O. B Pratt, G. P. Selby, S. W. F. Underhill, H. St. H. Vertue, A. L. Watts, and H. A. B. Whitelocke.

Forensic Medicine and Public Health.—C. H. Carlton, V. T. Ellwood, F. C. Gladstone, C. H. L. Harper, C. W. B. Littlejohn, G. A. Maling, E. E. Mather, O. G. Parry-Jones, M. O. Raven, G. S. Robinson, and G. P. Selby.

Medicine, Surgery, and Midwifery.—J. C. Davies, C. Dean, A. W. Dennis, C. W. B. Littlejohn, E. E. Mather, H. M. Pope, M. O. Raven, G. P. Selby, and A. B. Thompson.

Diploma in Public Health.

Part I.—F. S. Carson, G. M. Cogswell, H. B. Gibbins, W. H. Hewlett, J. Inkster, C. F. B. Kebbell, F. J. H. Martin, L. M. Mayers, R. S. Miller, H. W. Parnis, W. R. S. Roberts, and A. H. Savage.

Part II.—N. A. Coward, H. B. Gibbins, W. Gilmour, J. Inkster, F. J. H. Martin, J. Powell, E. L. N. Rhodes, W. R. S. Roberts, and A. H. Savage.

UNIVERSITY OF SHEFFIELD: FACULTY OF MEDICINE.—The following are the results of examinations held recently :—

First Examination for the M.B., Ch.B. Degrees.—James N. Gale, John V. Mainprize, Robert H. B. Mathews, John Ryan, Alice White, and Ethel White.

Second Examination for the M.B., Ch.B. Degrees.—Mary Andrews, Frederick G. E. Hill, and Florence E. Millard.

M.B., Ch.B. Final Examination.—Part B, completing examination: William B. Allen (Second Class Honours), Gordon F. Stones, Josiah R. Turner, Derwent C. Turnbull, and Charles H. Wilson.

Diploma in Public Health.—John R. McGregor, Ernest T. K. Walker, and Percival D. Warburton.

UNIVERSITY OF DURHAM: FACULTY OF MEDICINE.—At the Convocation on June 23rd the following degrees were conferred :—

Doctor of Medicine.—James Kenworthy Johnston Haworth, Eva Lumb, and Ralph Stuart Renton.

Doctor of Medicine for Practitioners of Fifteen Years' Standing.—William Oliver Beddard, William Horton Date, John Flynn, Alfred John Hesterlow, William Massingberd Middleton Jackson, James Ryan McFerran, Edwin Maynard, and John Jesudasen Srinavasagam Pillay.

Master of Surgery (M.S.).—Joseph Jopling Brown and James Carruthers Young.

Bachelor of Medicine (M.B.).—Cyril Armstrong and Ishmael Gustavus Cummings, College of Medicine, Newcastle-upon-Tyne; Henry Hawes Elliot, Guy's Hospital; Charles Norman Gover, Frank Wilson Harlow, Maurice Henry de Jersey Harper, and Cyril Jacobs, College of Medicine, Newcastle-upon-Tyne; Hubert Vere Leigh, Guy's Hospital; Francis Metcalfe, College of Medicine, Newcastle-upon-Tyne; Eric Knowles Ryan, University of Sheffield; and Herbert Joseph Shanley, Kirton Ivor Seager Smith, and James Calvert Spence, College of Medicine, Newcastle-upon-Tyne.

Bachelor of Surgery (B.S.).—Cyril Armstrong and Ishmael Gustavus Cummings, College of Medicine, Newcastle-upon-Tyne; Henry Hawes Elliot, Guy's Hospital; Idris David Evans, Charles Norman Gover, Frank Wilson Harlow, Maurice Henry de Jersey Harper, and Cyril Jacobs, College of Medicine, Newcastle-upon-Tyne; Hubert Vere Leigh, Guy's Hospital; and Francis Metcalfe, Herbert Joseph Shanley, Kirton Ivor Seager Smith, and James Calvert Spence, College of Medicine, Newcastle-upon-Tyne.

Bachelor of Hygiene (B.Hy.).—Arthur Hyde Wear and Stanley Worthington.

The following received the Diploma in Public Health (D.P.H.) :—

Arthur Hyde Wear and Stanley Worthington.

The following received the Licence in Dental Surgery (L.D.S.) :—

John Thomas Smith and Sidney Wilkinson, College of Medicine, Newcastle-upon-Tyne.

At the Second Examination for the degree of Bachelor of Medicine, the following candidates were successful :—

Anatomy and Physiology.—First Class Honours: William Andrew Hewitson, College of Medicine, Newcastle-upon-Tyne. Second Class Honours: Harold Mason Leete, College of Medicine, Newcastle-upon-Tyne. Pass List: Percy Vernon Anderson, William Duncan, Ernest Craig Dunlop, Mordecai Jacob Erdberg, Charles Gordon Irwin, Malcolm Cyril Joynt, Freda Newman, George Fleming Philip, and Harold Ivan Sterne-Howitt, College of Medicine, Newcastle-upon-Tyne.

At the Third Examination for the degree of Bachelor of Medicine the following candidates were successful :—

Materia Medica, Pharmacology and Pharmacy, Public Health, Medical Jurisprudence, Pathology and Elementary Bacteriology.—Second Class Honours: Henry Evers, John Alexander Charles, and Arthur Edwin Raine, College of Medicine, Newcastle-upon-Tyne. Pass List: John Francis Carter Braine, Guy's Hospital; John Brumwell, Harry Cecil Broadhurst, George Albert Clark, Horace George Bennett Dove, and John Horsley, College of Medicine, Newcastle-upon-Tyne; and Hugh Gordon Sparrow, St. George's Hospital and College of Medicine, Newcastle-upon-Tyne.

Materia Medica, Pharmacology and Pharmacy, Public Health and Medical Jurisprudence.—Mary Russell Campbell, Reginald Arthur Hooper, Norman Alexander Martin, Carl Damien Newman, William Oxley Forster Sinclair, Alfred Cresswell Tayler, and Robert Welch, College of Medicine, Newcastle-upon-Tyne.

Pathology and Elementary Bacteriology.—Lionel Basil Frere, Harold Kingston Graham-Hodgson, and James Dixon Johnson, College of Medicine, Newcastle-upon-Tyne; Douglas Oliver Richards, Guy's Hospital; and Alfred Smirthwaite, College of Medicine, Newcastle-upon-Tyne.

COMPLIMENTARY DINNER TO DR. JOHN BROWNLEE.—Last week a large company, mainly composed of Glasgow medical men, but representative also of the other professions in the city, met in the Grosvenor Hotel, Glasgow, to do honour to Dr. John Brownlee, lately physician-superintendent of Ruchill Hospital, on the occasion of his appointment as statistician to the Medical Research Committee under the National Insurance Act.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL.—The distribution of prizes at this school was made on Tuesday last by Sir Clifford Allbutt, Regius professor of physic at the University of Cambridge, who spoke hopefully of the future of the profession of medicine, which he considered would be enormously uplifted in the near future by the establishment of clinical and scientific centres all over the country. These, he said, would make the services of specialists available for every general practitioner at his need, while the necessity also of establishing a Ministry of Public Health was insisted upon.

RESEARCH DEFENCE SOCIETY.—The annual meeting of this society was held in the rooms of the Royal Society of Medicine on June 30th. The new President, Lord Lamington, in delivering his presidential address, said that the whole question of cruelty to animals should be considered in relation to the question as to how far it might be brutalising to the human mind. He referred to the predatory instincts found in animals, and said it might be presumed that if the wishes of dogs and cocks could be consulted they would enjoy nothing better than a good fight, but the law rightly held that whatever pleasure the animals might find in fighting it should not be allowed because of its brutalising effect on the human witnesses. He was honestly convinced that not physical pain so much as alarm to their instinct of self-preservation caused them suffering; anyone could see that they seemed indifferent to their wounds when unalarmed. All must recognise that pain was not felt with the same intensity by the lower creatures as by man, and even uncivilised man did not feel pain to the same degree as civilised man, while certain African races appeared totally insensible to pain and would on no account take an anæsthetic for an operation. In considering vivisection there could be no pain when the animals were experimented on under an anæsthetic and killed while under it. Only 5 per cent. of the experiments were of a surgical nature and these were done under an anæsthetic, and in many of them the animal was killed while under it. 95 per cent. of all experiments were of the nature of inoculations, and as to the question of pain in such, he had seen guinea-pigs infected with cancer moving about and feeding apparently without discomfort. The report of the Royal Commission showed that the actual pain caused was infinitesimal and in no degree comparable to that caused by the yearly mutilation of farm animals in millions of cases. In support of this he cited the evidence of Sir John MacFadyean before the Commission. In conclusion, he drew attention to benefits that had been derived from experiments on animals, alluded to the fact that in this way distemper among dogs might become curable, and pointed to the business of the society as the educating of public opinion to the true character and method of experiments on animals. The report stated that the membership of the society now exceeds 5000. At the conclusion of the meeting moving pictures of various disease-producing organisms were shown.

Literary Intelligence.—The W. B. Saunders Company announce for early publication a new work on Anoci-association by Professor G. W. Crile and Dr. W. E. Lower, assistant professor of genito-urinary surgery, Western Reserve University.

Death of a Centenarian.—The death occurred at Chichester on June 26th of Mrs. Elizabeth Coote, who was born on April 5th, 1812. On her 100th birthday she had a motor-car ride for the first time in her life. She was a native of Sussex.

Presentation to a Medical Man.—Dr. Evan Alban, who practised for many years at Lindfield, Sussex, and has now gone to Wales to reside, has been presented by his many friends at Lindfield and the surrounding district with a cheque for £100 and an illuminated address.

Tuberculosis Society.—We are asked to state that a meeting under the auspices of this society will be held at Leeds in the town hall at 7.45 P.M. on Wednesday, July 8th. Tuberculosis officers and practitioners specially interested in tuberculosis are invited to attend with a view to joining the society. A discussion on "The Future of the Tuberculosis Service" will be opened by the President, Dr. Halliday G. Sutherland.

St. George's Hospital.—The introductory address at the opening of the winter session of St. George's Hospital Medical School on Oct. 1st will be delivered by the Master of Christ's College, Cambridge, Mr. A. E. Shipley, F.R.S., in the large lecture theatre, at 3 P.M. The Master of Christ's will also present the prizes to the successful students. On the same evening the annual dinner will be held at Princes Restaurant, Piccadilly, at 6.30 for 7 o'clock, when the Right Hon. Sir Gerard Lowther, G.C.M.G., joint treasurer of the hospital, will take the chair.

Dr. J. E. Blomfield presided over a complimentary dinner given at the Crown Hotel, Sevenoaks, by the practitioners of Sevenoaks, Tonbridge, and the surrounding district to Mr. Arthur Maude, of Westerham, and Mr. E. G. A. Walker, of Ightham, in recognition of their prolonged and valuable services to the medical profession both in the local administration of the British Medical Association and in connexion with the National Insurance Act. Mr. Maude, who is resigning the chairmanship of the Kent medical committee and retiring from practice, was afterwards presented with a set of silver dessert dishes, inscribed with the words, "Pignus amicitiæ et gratitudinis."

Central Midwives Board.—Special meetings of the Central Midwives Board were held at Caxton House, Westminster, on June 9th and 10th, Sir Francis H. Champneys being in the chair. A number of midwives were struck off the roll, the following charges, amongst others, having been brought forward: The midwife disregarding the wish of the patient's relatives for medical assistance, and neglecting to take the pulse or temperature of a patient at her visits. A registered medical practitioner having been sent for on account of there being threatened danger the midwife did not await his arrival nor faithfully carry out his instructions as required by Rule E. 6; discontinuing attendance upon a patient at a time when she was dangerously ill. A child suffering from discharge from the eyes the midwife did not explain that the case was one in which the attendance of a registered medical practitioner was required, nor did she hand to the husband or the nearest relative or friend present the form of sending for medical help, properly filled up and signed by her, in order that this might be immediately forwarded to the medical practitioner, as required by Rule E. 20 (5). Attending a patient wearing a skirt of non-washable material, as required by Rule E. 1; being unable to take the pulse or temperature of patients, and consequently being unable to comply with Rule E. 13. With intent to avoid inspection by the local supervising authority the midwife neglected in the month of January in this year, and subsequently, although practising, to notify her intention to practise as a midwife as required by Section 10 of the Midwives Act, 1902. Medical aid having been sought for the child the midwife neglected to notify the local supervising authority thereof, as required by Rule E. 21 (1); not keeping the register of cases as required by Rule E. 23; paying no visits to the patient on the fifth, seventh, and ninth days; neglecting to disinfect the hands and forearms as required by Rule E. 3 when making an internal examination of the patient, and neglecting to adopt the antiseptic precautions required by Rule E. 7 before making the first internal examination of the patient; neglecting to wash and swab the patient's external parts as required by Rule E. 7. The case being one of puerperal fever the midwife continued to attend other patients without having undergone any disinfection to the satisfaction of the local supervising authority, as required by Rule E. 5; neglecting to explain to patients that the attendance of a registered medical practitioner is required in cases where the rules require the midwife to do so; neglecting to visit patients with due regularity, or to attend to their cleanliness, comfort, or proper dieting, as required by Rule E. 11. That being in attendance at a confinement the midwife, well knowing that the child was stillborn, falsely informed the father of the child and made false statements to other persons that the child had been born alive and had lived for a stated space of time; and describing and notifying as stillborn children who have, in fact, been born alive.—A meeting of the Central Midwives Board was held at Caxton House, Westminster, on June 18th, Sir Francis H. Champneys being in the chair. Jurisdiction of the Board: A letter was considered from a certified midwife forwarding a copy of a notice sent to her by the Cleveland Division of the North of England Branch of the British Medical Association. The Board decided that it be pointed out to the certified midwife that medical practitioners are not under the jurisdiction of the Board. Signing of cases: Correspondence attending the sending in of a schedule by a candidate for the examination of June 15th in which she had falsified the names and dates of several of the patients attended by her and had then certified them to be correct and true in all respects was considered. The Board decided amongst other matters that as regards the signature of the medical practitioner as to the correctness of the cases the facts be communicated to the General Medical Council. Examinations: A letter was considered from the honorary secretary of the medical committee of the Birmingham Maternity Hospital asking the Board to arrange for the holding of six examinations each year at Birmingham. The Board directed that the application be granted. Qualifying cases: A letter was considered from the resident medical officer of a recognised training school asking the Board whether a portion of the 20 necessary cases taken two years ago may be counted as qualifying a candidate to enter for the examination of the Central Midwives Board. The Board decided that the resident medical officer be informed that the proposed procedure is contrary to the intention of the Board, and is in its opinion highly undesirable.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

Milk and Dairies Bill.

A number of amendments have been introduced by the Standing Committee of the House of Commons into the clause in the Milk and Dairies Bill prohibiting the sale of tuberculous milk. The effect is that in order to succeed the prosecution will have to prove that the farmer or dairyman has received notice that the milk was infected or the product of a diseased cow, or that he knew it to be so, or that by the exercise of ordinary care he could have ascertained the fact. In regard to the mixed milk from a number of cows, Mr. Herbert Samuel, the President of the Local Government Board, said that he proposed that the department should be authorised to make regulations to prevent danger arising from the sale of such milk or its use in manufactured products.

On Monday, June 29th, the committee had under consideration Clause 2, which contains provisions for the extension of the power to make orders respecting milk and dairies. Mr. Astor brought forward a proposal for the granting by local authorities of annual certificates of registration of dairymen and the suspension or revocation of [illegible] ertificates where a dairyman had been guilty of repeated or erious offences against the Act. This proposal was strongly pposed, and was ultimately negatived without a division.

Milk and Dairies (Scotland) Bill.

On Thursday, June 25th, the Scottish Standing Committee f the House of Commons adopted a provision which is esigned to define the powers of a local authority to trace ontaminated milk coming from an area outside its own. his took the form of a subsection to Clause 4 of the Milk nd Dairies (Scotland) Bill. It was in the following terms: "When the medical officer of health or the sanitary nspector of any district is of opinion that any milk consigned to the district from any other district is contaminated r impure, or when the medical officer has any reasonable round for believing that any milk consigned as aforesaid s likely to cause any infectious disease or other illness, it hall be lawful for the medical officer of health, sanitary nspector, or veterinary inspector to the first-named district, o inspect the dairy from which such milk has been consigned, nd to examine the cattle therein, and the dairyman and ersons in his employment shall give all reasonable facilities nd assistance to such officers for such inspection and xamination." Some complaint was made that this would ave the effect of reducing powers of inspecting milk pplies already possessed by Glasgow and Edinburgh under rivate Acts, but the retention of those powers may be iscussed at a later stage in the proceedings.

Excellent progress was made with the Bill on Tuesday, une 30th. Few alterations were made in the text. An mendment was introduced at the instance of Captain ILMOUR to protect the name "milk" against being applied o milk substitutes.

Vital Statistics for 1912.

The seventy-fifth annual report of the Registrar-General of Births, Deaths, and Marriages in England and Wales n 1912 has been presented to Parliament. In it it is stated that the birth-rate in 1912 was 23·8 per 1000, and was 3·0 below the average of the preceding decennium. It was the lowest rate on record, being no less than 0·6 below that of 1911 which was the next lowest. The provisional figures for 1913, however, indicate a rise of 0·1 per 1000 upon the rate of 1912, this being the first year since 1903 to show an increase. The report adds that in view of the fact that the rise in 1903 proved to be only a temporary check to the general downward tendency it would be unsafe to conclude that there is any present indication of a real check in the decline of the birth-rate. The death-rate in 1912 was 13·3 per 1000, and was 1·9 per 1000 below the average for the 10 preceding years. It was the lowest on record, being 0·2 per 1000 below the lowest previously recorded, that of 1910. Infant mortality was 95 per 1000 births, being 30 per 1000 below the average of the preceding decennium. It was the lowest rate on record, being 10 per 1000 births below the lowest rate recorded, that for the year 1910. The provisional infant mortality rate for 1913, when the summer conditions were less favourable to infant life, is 109 per 1000 births. It is noted that the death-rates from enteric fever, diphtheria and croup conjointly and diarrhœal diseases were the lowest recorded. Cancer caused a higher death-rate both among males and among females than in any preceding year, but the rate from tuberculosis as a whole was the lowest on record.

insured persons, tuberculosis laboratories, and nurses was to be divided amongst the three items mentioned.—Mr. MONTAGU replied: It is proposed that of the sum referred to £400,000 should be allocated to tuberculosis services, £250,000 to nursing, and £100,000 to pathological laboratories.

Mr. WORTHINGTON EVANS: Have these grants been abandoned or are they in the amended Budget?—Mr. MONTAGU: They have not been abandoned. They are in the Finance Bill.

Small-pox at Pretoria.

Mr. TENNANT (Under Secretary of State for War) in reply to Mr. JOHN WARD said: So far as the Army Council are aware only one case of small-pox has occurred in the Bedfordshire Regiment at Pretoria. The man had undergone primary vaccination on enlistment in October, 1905. The case occurred in May, 1914, and the man had not been revaccinated since 1905. In the circumstances no change in the present regulations in regard to vaccination appears to be called for.

THURSDAY, JUNE 25TH.

The Mortality of Seamen.

Replying to Major ARCHER-SHEE, Mr. BURNS (President of the Board of Trade) wrote: The investigations into the mortality of seamen are being conducted by Mr. E. G. Moggridge, Mr. E. W. Colvill, Mr. C. Hipwood, Mr. T. F. Jenkins, and Captain A. H. Young, of the Board of Trade; Dr. A. H. Newsholme, of the Local Government Board; and Dr. T. H. C. Stevenson, of the General Register Office. They are considering the mortality among seamen on British merchant ships, as shown in the vital statistics, with a view to reporting what steps are desirable to diminish that mortality and how far such steps will need legislation. They will, if necessary, take evidence.

MONDAY, JUNE 29TH.

The Excessive Sickness Inquiry.

Mr. WEDGWOOD BENN stated in reply to Mr. CHARLES BATHURST that he was informed that the Departmental Committee upon excessive sickness in connexion with the National Insurance Act had finished taking evidence and hoped to report at an early date.

National Insurance and the Government of Ireland Bill.

Mr. NEWMAN asked the Chancellor of the Exchequer whether the proportion of the proposed grants due to Ireland in respect of National Health Insurance, feeding of school children, nursing, and health research would be specifically allocated in respect of the above enumerated or similar services, or would in the event of the Government of Ireland Bill becoming an Act be automatically added to the transferred sum and be at the disposal of the Irish Government.—Mr. LLOYD GEORGE answered: Subject to the provision of Clause 5 (2) of the Government of Ireland Bill all public services in Ireland in connexion with the administration of the National Insurance Act are matters reserved to the Government of the United Kingdom. The proposed grant in respect of National Health Insurance will be administered by that Government. The equivalent grants to Ireland corresponding to the grants in Great Britain for new educational services, tuberculosis, and pathological laboratories will be added to the transferred sum, and be at the disposal

I am, Sir, yours faithfully,
W. GRAHAM REYNOLDS.
St. Mary's Hospital, W., June 22nd, 1914.

HEALTH AND SANITATION IN CEYLON.

A SUPPLEMENTARY report on the affairs of Ceylon for the year 1912 (delayed on account of fresh arrangements in connexion with the publication of the Blue-book of the colony) has just been presented to Parliament. It shows that the estimated population on Dec. 31st was 4,189,000. There is an excess of males over females, the proportion being 113 males to 100 females. The birth-rate for 1912 was 33 per mille, and was lower than the average (38). It appears to be gradually declining. The death-rate for the whole island was 32 per mille, and was in excess of the average (28). The Ceylon rate appears to be lower than that of Bombay, but higher than rates in Bengal, Madras, Jamaica, and British Guiana. The infantile mortality was 215 per 1000 births, compared with an average of 183. Snakebite, homicide, and suicide each accounted for 50 deaths per 1,000,000 of the population. There were 29 executions—i.e., 7 per 1,000,000, as compared with 4 per 1,000,000 in England and Wales. The tea, rubber, and cocoa estates contain a population of about 578,200, mostly of Tamils immigrant from Southern India. The estate death-rate rose to 40 from an average of 35, and in one district was as high as 72. The chief causes of death were fever (chiefly malarial), diarrhœa, dysentery, pneumonia, and phthisis. There were only 13 deaths from cholera, as against 277 in 1911 and 22 in 1910. Deaths from small-pox numbered 15, as against 89 in 1911 and 29 in 1910. Ankylostomiasis claimed 1843 victims, as against 2001 in 1911. Measures have been taken for the prevention of malaria by the free distribution of quinine, the circulation of leaflets, and lectures and demonstrations to the public through the officers of the Medical Department and the headmen. Ankylostomiasis, which is extremely prevalent amongst estate coolies, especially in the low country, has been and is receiving considerable attention on the part of the inspecting medical officers. A large number of estates have been visited by them, and both prophylactic and medical treatment are being adopted. Parangi (yaws) has been treated successfully with salvarsan in some of the hospitals, and arrangements are being made to introduce it to other hospitals. Vaccination is systematically carried on throughout the island by a special staff. During the year 140,501 subjects were vaccinated. The percentage of successful primary vaccinations to total inspected was 93·3, while that of successful re-vaccination cases was 71·7. Stringent precautions are taken under the auspices of the plague committee to prevent the introduction of plague into Ceylon, which has hitherto been immune from the disease. One case of plague in a European was landed at Galle in July, the patient recovering. There were 14 deaths from hydrophobia, as against 38 in the previous year. The Ceylon Government gives an annual grant to the Pasteur Institute at Coonoor, and poor persons bitten by rabid animals and unable to bear the expense of the journey are sent there at the cost of the Government. Concerted action is being taken by the local authorities to stamp out rabies by enforcing the registration of dogs and by the destruction of homeless vagabond dogs (pariahs).

The drainage of Colombo has been undertaken by Government at the request of the municipal council, the necessary funds being advanced by Government on loan, while further assistance is being given by the contribution of a part of the expenditure as a free grant. The scheme provides for a complete system of sewers and rain-water drains throughout the city and for the disposal of the sewage by bacterial treatment upon modern lines. With the assistance of Government, partly by way of grant, partly of loan, various local bodies have undertaken the provision of an improved water-supply for the towns under their control.

There is a marked variation in climate between the different parts of Ceylon. In the low country, with a mean temperature of the order of 80° F., a noticeable feature is the small range of both temperature and pressure. There is, however, wide divergence between the moist conditions in the south-west of the island, where the annual rainfall is often over 100 inches, and the dry zone areas of the north, north-west, and south-east. Inland, with altitudes reaching 8000 feet, the temperature is cooler and shows a bigger daily range; there is a corresponding change in vegetation, and the conditions are altogether more akin to those in the temperate zone. The rainfall of 1912 was below normal in the north and north-east, and above it in the south and south-west. Ratnapura again headed the list in absolute amount—viz., 149·95 inches, which is practically identical with the average for that station. Colombo observatory, with 101·14 inches on 195 days, was well above normal. The mean temperature at Colombo was 81·0° F., and at Kandy 76·6°. The highest temperature reached in the island was 100·2° on August 10th at Anuradhapura. The highest on record is 103·7° at Trincomalee on May 12th, 1890.

There are 76 Government hospitals, the number of beds in them ranging from 30 to 425. In addition, there are 418 out-door Government dispensaries and 279 estate dispensaries supported by the planters, who get their drugs free up to a value of 50 cents per cooly per annum. The Lunatic Asylum is situated in Colombo. There are 714 inmates. The Leper Asylum is situated about six miles from Colombo, and contains 398 patients. A small establishment for lepers exists in the eastern province, and contains 36 patients. A large leper settlement is to be founded there shortly. In association with Government a home for incurables (containing 80 beds) is worked by a committee of Government officials and representatives of the public.

The Medical College accommodated in 1912 145 medical and 90 apothecary students. The full course of training for medical students is five years. A diploma in medicine, surgery, and midwifery (which can be registered in the United Kingdom) is granted to successful students. In association with the college there are a bacteriological institute with a small clinic for tropical medicine attached, a laboratory for the Government analyst, an ophthalmic hospital, a lying-in home, a woman's hospital, a children's hospital, and special hospitals for the insane, lepers, and infectious diseases.

SEA-BATHING AND COLD BATHS.

SEA-BATHING began to be popular in England in the "seventies" of the eighteenth century. In 1779 Margate is referred to as "a place of great resort for sea-bathing." Our quotation is from "A Tour Through the Island of Great Britain," eighth edition, a work begun by Daniel Defoe and continued by Samuel Richardson. Later we read "Brighthelmstone is now become a polite place, and very convenient for sea-bathing. Several machines have been built." In other early guide-books of this period the machines are elaborately described and illustrated, and it is to be noticed that the little dome-like tent, still sometimes seen at the back or sea-door of the machine, [illegible] ntended to ensure privacy for persons in the costume of Adam or even of Eve. The sea-bath was adventured on or hygienic purposes. It was supposed by its more nthusiastic advocates, such as Dr. White, a writer n the subject in 1775, to cure quite a number of diseases. The sea-bath did not reach the continent until many years ater. At the time of the Restoration, after Waterloo, ertain English families, driven from their own country y creditors, brought the custom to Dieppe. All the outy and lame among the new immigrants are said to ave gone to the bleak northward-facing beach in the onth of August, and there, leaving their clothes in heaps, hey "bravely presented their heads and shoulders to the aves." In other words, the men bathers struck out to ea. They soon found Gallic imitators. Remarkable salt-ater cures were recorded. Certain famous French hysicians took the custom under their protection and ashion did the rest. Hence, when Vitet published his Guide to Dieppe" in 1844—it is quite a work of literature —he was able to refer to an annual exodus of sea-athers to all the French seaside towns and villages. uch baths, says this writer, are not the remedy of very ill; it would certainly be easier to cite the illnesses o which they are hostile than to make out a list of those hich they can successfully combat or root out. The *tablissement* at Dieppe dates from 1821, but although atronised by the famous Duchesse de Berry, it was probably for long regarded as somewhat of a fad. Indeed, as e travel eastward in Europe we find that wonder at the nglish bathing habit increases apace. From Paris eastards it is common form to say that "the English must e a very dirty people" to require so many baths, and as e reach Vienna we find the bath regarded as an occasional uxury only. Yet the ancient Teutons, according to acitus, were the original users of the cold river bath. ow can we account for the shyness in this matter of their irect descendants? And how is it that the Gaul, the nheritor of Roman tradition, is not an ardent advocate of he bath?

A WARNING.

To the Editor of THE LANCET.

IR,—By the advice of the police I am warning your ders against a man of gentlemanly and plausible address o consulted me on June 24th, paying his fee by a cheque the Tottenham Court-road branch of the London City and lland Bank. This draft was returned marked "no ount," and the book from which it was torn is one issued e years ago by the bank. It appears, further, that ther doctor besides myself has similarly been defrauded ently. The man is of medium height, dark, heavily led, and wearing a short moustache. He gave the name "J. Howard Stewart" and his age as 38 and 9 months, but may use other aliases.

I am, Sir, yours faithfully,
MACLEOD YEARSLEY.

ueen Anne-street, W., June 30th, 1914.

E NIGHTINGALE FUND: PROPOSED NEW SCHEME OF SCHOLARSHIPS FOR NURSES.

yet fully matured, but its outline is briefly this: the council will offer every year a limited number of scholarships to nurses who have obtained a certificate after three years' training in some recognised school. These scholarships will entitle the holders to a year's training at the Household and Social Science Department of King's College for Women in the University of London. This department, which will be carried on in the new buildings now in course of erection on Campden Hill, has specially applied itself to the teaching required. Its specially fitted laboratories are in close proximity to the experimental kitchen and laundry which form a portion of the hostel where the practical arts are taught. The college has met the council in every way in the preparation of a suitable course, so conceived as to embrace both theory and practice. Every endeavour will be made to keep in view the object of the course—namely, to equip trained nurses to undertake the responsible positions they are likely to be called on to fill. The subjects chosen will, to this end, be dealt with largely from the practical point of view; and, as experience adds to knowledge, this, the first scheme, will no doubt be modified later, both by omission and addition. It is also intended to ensure the elasticity of the scheme by introducing the principle of alternative subjects, so that a scholar shall be able to select such courses as shall seem most likely to help in the ambitions she may have placed before herself. The value of the scholarships will be adjusted to meet the tuition fees, to provide maintenance during the year, and to compensate in some degree for the salary the year's training will oblige the scholar to forego. The new buildings of the college include a hostel in which scholars would be able to reside should they so wish. The scheme is experimental, and its continuance must depend upon its success; we cannot but think that the want of such higher practical training is a real one, and nurses will gladly avail themselves of the new opportunities. Its very tentativeness should help to its success, for if, as the council believes, the principle be a wise one, its application can be varied with the years until an ideal scheme be evolved.

THE EYESIGHT OF RECRUITS.

To the Editor of THE LANCET.

SIR,—Can any of your readers tell me where I can obtain information on this matter? What I more particularly want to know is the percentage of men who are rejected on account of myopia. I am, Sir, yours faithfully,
J. A. WILSON, M.D. Glasg.

Glasgow, June 29th, 1914.

A HARD CASE.

Dr. S. C. Lawrence, medical officer of health of Edmonton, writes on behalf of a widow in poor circumstances who has to go out to work daily, but unfortunately she has a boy, aged 3 years, who is frequently having severe epileptic fits. This condition compels her either to refuse work or pay a neighbour 4s. weekly to look after him. This is (either way) a heavy tax on her slender purse, and makes human food is a little different in a country where to hide your food in an igloo snow-house or ice-cave is impossible That artificial refrigeration costs money is the reply to our correspondent's question. The storage of meat is said to be 1*d.* per stone per month. A joint of meat has just been exposed at Smithfield market after having been kept refrigerated for 18 years, and apparently it is still good enough for human food. At the beginning of this year a family at the mouth of the Thames shared the remains of a wedding cake 50 years old. We have also heard of the mummy wheat of the time of the Pharaohs, used as seed, but all these pale into insignificance at the memory of somebody cutting and eating a steak from a mammoth whose age was computed to be tens of thousands of years of preservation in the solid ice. Tinning food is the modern method of preserving it, and we do not know the greatest age of any tinned food which has been considered wholesome enough for food, but as we stated in an annotation in THE LANCET of Feb. 25th, 1911, on canned goods and the public health, it has been shown that the quantity of tin dissolved increases with the age of the goods, because the acid juices continue to act upon the metal, but with other substances it might be possible to avoid or postpone this contamination. Some retailers say that certain foods improve by prolonged keeping—e.g., sardines. There is no doubt that in the packing and preserving of fruit some colonists could give us a few hints. The following are a few of the things employed: tissue paper or wood shavings, cotton- or wood-wool, dry moss, cork dust and muslin, charcoal, and ice. The colonial authorities have provided extensive cold storage stores on shore, and the shipping companies have done a good deal by *providing refrigerating chambers of special* construction, although all these precautions are more or less nullified unless the colonist packs dry and well-chosen goods. Every housewife knows how difficult it is to keep the mould from the cheese, from the bread in the pan, and from the bottled pickles, fruits, and jams. Freezing or chilling is the sheet-anchor of food preservation nowadays, and millions of pounds' worth of frozen meat, rabbits, hares, and fish are transported, and salting or smoking is resorted to with meats and sun-drying or the artificial exhaustion of moisture with fruits; but it is known that in prolonged storage these things will often lose weight and engender a condition of staleness. The difficulty of keeping food arises from the fact that where the food is there will the living things be gathered together to feed on it, and the farmer and colonist have a continual fight at great expense against the fruit flies, flesh flies, devastating insects of all kinds and fungi and blights of extraordinary pertinacity in order even to be able to get the produce as far as our tables, and when we have got it there we in our turn find the fight continued to preserve it. Evidently food is not meant to be kept for any great length *of time, at all events only for winter* storage.

◆

P. H.—When thallium pomade is used there is always the risk of absorption, though this occurs only very rarely. The effect of absorption might show itself either by a general depilatory action or by effect on the general system.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

METEOROLOGICAL READINGS.

The following magazines, journals, &c., have been received:—Canadian Medical Association Journal, Annales Paulistas de Medicina e Cirurgia, Interstate Medical Journal, Indian Medical Gazette, Journal of State Medicine, Archives of Internal Medicine, Klinik für Psychische und Nervöse Krankheiten, Mercy and Truth, Archiv für Schiffs- und Tropen-Hygiene, Journal of Nervous and Mental Diseases, South African Medical Record, Journal of the Royal Sanitary Institute, Ophthalmoscope, American Journal of Orthopedic Surgery, Therapeutic Gazette, &c.

Medical Diary for the ensuing Week.

LECTURES, ADDRESSES, DEMONSTRATIONS, &c.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC, 22, Chenies-street, W.C.

MONDAY.—4 P.M., Dr. G. Little: Clinique (Skin). 5.15 P.M., Lecture:—Mr. L. Mummery: Chronic Obstruction of the Large Bowel.

TUESDAY.—4 P.M., Dr. G. Rankin: Clinique (Medical). 5.15 P.M., Lecture:—Mr. J. W. T. Walker: Urinary Antiseptics.

WEDNESDAY.—4 P.M., Mr. P. P. Cole: Clinique (Surgical). 5.15 P.M., Lecture:—Dr. A. Wylie: The Diagnosis and Treatment of Tubercular, Syphilitic, and Malignant Disease of the Larynx.

THURSDAY.—4 P.M., Dr. W. H. Willcox: Clinique (Medical). 5.15 P.M., Lecture:—Dr. A. F. Tredgold: Mental Deficiency Act.

FRIDAY.—4 P.M., Dr. H. W. Lyle: Clinique (Ear, Nose, and Throat).

POST-GRADUATE COLLEGE, West London Hospital, Hammersmith-road, W.

MONDAY.—10 A.M., Dr. Simson: Diseases of Women. 10.30 A.M., Medical Registrar: Demonstration of Cases in Wards. 11 A.M., Dr. Bernstein: Pathological Demonstration. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. D. Armour: Operations. Dr. Pritchard: Bacterial Therapy Department. Mr. B. Harman and Mr. Gibb: Diseases of the Eye. 5 P.M., Lecture:—Mr. Addison: Tumours and Diseases of Bone.

TUESDAY.—10 A.M., Dr. Robinson: Gynæcological Operations. *Dr. Owen: Demonstration of Cases in Wards.* 12 noon, Mr. T. Gray: Demonstration of Fractures, &c. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Baldwin: Operations. Dr. Davis: Diseases of the Throat, Nose, and Ear. Dr. Pernet: Diseases of the Skin. 5 P.M., Clinical Lecture:—Dr. Davis: Diseases of the Throat.

WEDNESDAY.—10 A.M., Dr. Saunders: Diseases of Children. Dr. Davis: Operations of the Throat, Nose, and Ear. 11 A.M., Mr. Souttar: Demonstration of Minor Operations. 12 noon, Lecture:—Mr. Souttar: Abdominal Diagnosis. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Pardoe: Operations. Dr. Simson: Diseases of Women. Mr. Gibb: Diseases of the Eye. 5 P.M., Lecture:—Mr. Addison: Tumours and Diseases of Bone.

THURSDAY.—9 A.M., Dr. Bernstein: Bacterial Therapy Department. 10.30 A.M., Dr. Simson: Gynæcological Demonstration. 12 noon, Lecture:—Dr. G. Stewart: Neurological Cases. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. D. Armour: Operations. Mr. B. Harman: Diseases of the Eye. 5 P.M., Lecture:—Mr. Addison: Tumours and Diseases of Bone.

FRIDAY.—10 A.M., Dr. Robinson: Gynæcological Operations. 10.30 A.M., Surgical Registrar: Demonstration of Cases in Wards. 12.15 P.M., Lecture:—Dr. Bernstein: Applied Pathology. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Baldwin: Operations. Dr. Davis: Diseases of the Throat, Nose, and Ear. Dr. Pernet: Diseases of the Skin. 5 P.M., Clinical Lecture:—Dr. Davis: Diseases of the Nose.

SATURDAY.—10 A.M., Dr. Saunders: Diseases of Children. Dr. Davis: Operations of the Throat, Nose, and Ear. Mr. B. Harman: Operations of the Eye. 12 noon, Lecture:—Mr. Souttar: Surgical Anatomy of the Abdomen. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Pardoe: Operations.

LONDON SCHOOL OF *CLINICAL* MEDICINE, Dreadnought Hospital, Greenwich.

MONDAY.—Out-patient Demonstrations:—10 A.M. Dr. H. B. Carlill: Medical. Mr. H. Curtis: Surgical. 12 noon, Mr. G. N. Biggs: Throat, Nose, and Ear.——2.15 P.M., Mr. W. Turner: Surgery. 3 P.M., Mr. W. Turner: Operations. 3.15 P.M., Sir Dyce Duckworth: Medicine. 4.15 P.M., Mr. R. Lake: Throat, Nose, and Ear.

TUESDAY.—Out-patient Demonstrations:—10 A.M., Dr. C. E. [illegible]: Medical. Mr. Cole: Surgical. 12 noon, Dr. H. MacCormac: Skin.——2 P.M., Mr. L. McGavin: Operations. 2.15 P.M., Mr. R. Carling: Surgery. 3.15 P.M., Dr. G. Rankin: Medicine. 4.15 P.M., Sir Malcolm Morris: Skin.

WEDNESDAY.—Out-patient Demonstrations: 10 A.M., Dr. H. B. Carlill: Medical. Mr. Cecil Rowntree: Surgical. 11 A.M., Mr. R. B. Bickerton: Eye.——2 P.M., Mr. L. V. Cargill or Mr. Choyce: Operations. 2.15 P.M., Dr. F. Taylor: Medicine. 3.15 P.M., Mr. Cargill: Eye Clinique. 4.30 P.M., Mr. C. C. Choyce: Surgery.

THURSDAY.—Out-patient Demonstrations:—10 A.M., Dr. H. E. Prentice: Medical. Mr. H. Curtis: Surgical. 12 noon, Mr. G. N. Biggs: Throat, Nose, and Ear.——2 P.M., Mr. R. Carling or Mr. W. Turner: Operations. Dr. A. Davies: Pathological Demonstration. 3.15 P.M., Dr. R. Wells: Medicine.

FRIDAY.—Out-patient Demonstrations;—10 A.M., Dr. C. E. [illegible]: Medical. Mr. Cole: Surgical. 12 noon, Dr. H. MacCormac: Skin.——2 P.M., Mr. L. McGavin: Operations. 2.15 P.M., Sir John Rose Bradford: Medicine. 3.15 P.M., Mr. L. McGavin: Surgery.

SATURDAY.—Out-patient Demonstrations: 10 A.M., Dr. E. E. Prentice: Medical. Mr. Cecil Rowntree: Surgical. 11 A.M., Mr. R. B. Bickerton: Eye.——10 A.M., Col. Barry: [illegible].

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.

MONDAY.—Clinics:—10.30 A.M., Surgical Out-patient (Mr. E. Gillespie). 2.30 P.M., Medical Out-patient (Dr. T. R. Whipham); Gynæcological (Dr. Banister). 3 P.M., Medical In-patient (Dr. R. M. Leslie).

TUESDAY.—2.30 P.M., Operations. Clinics:—Medical Out-patient (Dr. A. G. Auld); Surgical (Mr. Howell Evans); Nose, Throat, and Ear (Mr. H. D. Gillies). X Ray and Electrical Department (Dr. Metcalfe). 3.30 P.M., Medical In-patient (Dr. A. J. Whiting).

WEDNESDAY.—Clinics:—2 P.M., Throat Operations (Mr. Gillies). 2.30 P.M., Children's Out-patient (Dr. T. R. Whipham); Skin (Dr. G. N. Meachen); Eye (Mr. Dorell).

THURSDAY.—2.30 P.M., Gynæcological Operations (Dr. A. E. Giles). Clinics:—Medical Out-patient (Dr. A. J. Whiting); Surgical (Mr. Carson); X Rays and Electrical Methods (Dr. Metcalfe).
FRIDAY.—2.30 P.M., Operations. Clinics:—Medical Out-patient (Dr. A. G. Auld); Surgical (Mr. E. Gillespie); Eye (Mr. R. P. Brooks). 3 P.M., Medical In-patient (Dr. G. P. Chappel).

YAL HOSPITAL FOR DISEASES OF THE CHEST, Medical chool, City-road, E.C.
MONDAY.—1.30 P.M., Department for the Prevention of Consumption. 2 P.M., Cardiac Department, Dr. Stott; Out-patient Department, Dr. Phear, Dr. S. Thompson. 3 P.M., Wards, Dr. Phear.
TUESDAY.—9 A.M., Laryngological Department, Mr. Mant. 1.30 P.M., Department for the Prevention of Consumption. 2 P.M., Out-patient Department, Dr. M. Leslie, Dr. B. King; Operations, Mr. A. Evans. 3 P.M., Wards, Dr. White. 4 P.M., Wards, Dr. M. Leslie.
WEDNESDAY.—2 P.M., Wards, Dr. A. Davies; Out-patient Department, Dr. Drysdale, Dr. Kellie. 4 P.M., Wards, Dr. Drysdale. 4.30 P.M., Roentgen Ray Department, Dr. Jordan.
THURSDAY.—9.30 A.M., Dental Department, Mr. G. Thomson. 10 A.M., Cardiac Department, Dr. Stott. 1.30 P.M., Department for the Prevention of Consumption. 2 P.M., Out-patient Department, Dr. Phear, Dr. S. Thompson. 4.30 P.M. Laryngological Department, Mr. Mant.
FRIDAY.—1.30 P.M., Department for the Prevention of Consumption. 2 P.M., Wards, Dr. Calvert; Out-patient Department, Dr. M. Leslie, Dr. B. King.
SATURDAY.—10 A.M., Out-patient Department, Dr. Drysdale, Dr. Kellie. 11.30 A.M., Roentgen Ray Department, Dr. Jordan.

SPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, rompton, S.W.
WEDNESDAY.—4.30 P.M., Dr. Miller: The Morbid Anatomy of Tuberculous Lesions in Relation to Morbid Physical Signs.

Y OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, ictoria Park, E.
ourse of Demonstrations for Post-Graduates:—
WEDNESDAY.—4 P.M., Dr. W. A. Chaplin; Demonstration of Cases in the Wards.

TIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, ueen-square, Bloomsbury, W.C.
TUESDAY.—3.30 P.M., Clinical Lecture:—Dr. H. Howell: Facial Neuralgia and its Treatment.
FRIDAY.—3.30 P.M., Clinical Lecture:—Dr. H. Howell: Recent Methods of Treatment of Parasyphilitic Disease.

NTRAL LONDON THROAT, NOSE, AND EAR HOSPITAL, Gray's nn-road, W.C.
TUESDAY AND FRIDAY.—3 P.M., Mr. Stuart-Low: Diseases of the Ear.

E THROAT HOSPITAL, Golden-square, W.
MONDAY.—5.15 P.M., Special Demonstration of Selected Cases.
THURSDAY.—5.15 P.M., Clinical Lecture.

NCHESTER HOSPITALS POST-GRADUATE CLINICS.
TUESDAY.—MANCHESTER AND SALFORD HOSPITAL FOR SKIN DISEASES, Quay-street.—4.30 P.M., Dr. W. Dyson: Tuberculosis of the Skin (II.).
WEDNESDAY.—ROYAL INFIRMARY—4.30 P.M., Mr. Ray: Tumours of the Inguinal and Scrotal Regions.
THURSDAY.—ANCOATS HOSPITAL—4.30 P.M., Mr. Platt: Infantile Paralysis.

or further particulars of the above Lectures, &c., see Advertisement Pages.

A DIARY OF CONGRESSES.

e shall publish this diary from time to time that our readers may ave under their hands the dates of the approaching scientific Congresses. It is unnecessary to issue the lists of all these functions eek by week, and we propose to make only such gatherings as will ccur in the immediate future the subject of regular announcement. The following Congresses, Conferences, and Exhibitions are nnounced:—

May 1st–Nov. 1st (Lyons).—International Town Hygiene Exhibition.
,, 15th–Oct. 15th (Berne).—Swiss National Exhibition.
May–October (London, Shepherd's Bush).—Anglo-American Exposition.
June 24th–July 9th (London, Royal Agricultural Hall).—Fourth International Rubber and Allied Industries Exhibition.
June–July (Groningen).—University of Groningen 300th Anniversary Celebration.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this office.

Lectures, original articles, and reports should be written on one side of the paper only, AND WHEN ACCOMPANIED BY BLOCKS IT IS REQUESTED THAT THE NAME OF THE AUTHOR, AND IF POSSIBLE OF THE ARTICLE, SHOULD BE WRITTEN ON THE BLOCKS TO FACILITATE IDENTIFICATION.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers—not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale, and advertising departments of THE LANCET *should be addressed "To the Manager."*

We cannot undertake to return MSS. not used.

MANAGER'S NOTICES.

TO SUBSCRIBERS.

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423, Strand, London, W.C., are dealt with by them? Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and *not* to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will ensure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

THE COLONIAL AND FOREIGN EDITION (printed on thin paper) is published in time to catch the weekly Friday mails to all parts of the world.

The rates of subscriptions, post free from THE LANCET Offices, have been reduced, and are now as follows:—

FOR THE UNITED KINGDOM.		TO THE COLONIES AND ABROAD.	
One Year	£1 1 0	One Year	£1 5 0
Six Months	0 12 6	Six Months	0 14 0
Three Months	0 6 6	Three Months	0 7 0

(The rate for the United Kingdom will apply also to Medical Subordinates in India whose rates of pay, including allowances, is less than Rs.50 per month.)

Subscriptions (which may commence at any time) are payable in advance. Cheques and Post Office Orders (crossed "London County and Westminster Bank, Covent Garden Branch") should be made payable to the Manager, Mr. CHARLES GOOD, THE LANCET Offices, 423, Strand, London, W.C.

TO COLONIAL AND FOREIGN SUBSCRIBERS.

SUBSCRIBERS ABROAD ARE PARTICULARLY REQUESTED TO NOTE THE RATES OF SUBSCRIPTIONS GIVEN ABOVE.

The Manager will be pleased to forward copies direct from the Offices to places abroad at the above rates, whatever be the weight of any of the copies so supplied.

Wellcome and Co., Lond.; Brentford Guardians, Clerk to the; *British and Colonial Druggist*, Lond., Manager of; Messrs. Baiss Brothers and Stevenson, Lond.; Mr. C. Birchall, Liverpool; Dr. S. N. Bruce, Lond.; Beckenham, Medical Officer of Health of; Dr. P. F. Barton, Lond.; Board of Education, Lond., Secretary of; Dr. Julius Bernstein, Lond.; Dr. C. A. Bucklin, Glasgow; Mr. Ernest Bell, Lond.; British Fire Prevention Committee, Lond., Registrar of; Sir Lauder Brunton, Bart., Lond.; Bolingbroke Hospital, Lond.; Messrs. Butterworth and Co., Lond.; Mr. H. Butterfield, Northampton; Fleet-Surgeon P. H. Boyden, R.N., Lond.; Mr. F. Handel Booth, Lond.; Dr. John Biernacki, Lond.

C.—Mr. H. A. Collins, Croydon; Mr. S. Coxon, Hampton Wick; Clinical Congress of Surgeons, Lond., Manager of; Dr. T. Colvin, Glasgow; Chadwick Trust, Lond., Secretary of; Dr. Albert J. Chalmers, Khartoum; Dr. Raymond Crawfurd, Lond.; Children's Country Holidays Fund, Lond., Secretary of; Mr. Adrian Caddy, Calcutta; Messrs. E. Cook and Co., Lond.; Nurse Clowes, Wolverhampton; Croydon Corporation, Medical Officer of Health of; Major W. S. Crosthwait, R.A.M.C., Folkestone; Dr. D. J. Clark, Glasgow; Messrs. C. D. Clayton, Lond.; Dr. H. W. Cattell, Philadelphia; Curhäuser Somvixertal Grisons, Manager of; Cornwall, County Medical Officer of Health of, Truro; Nurse Carruthers, Lond.; *Concrete and Constructional Engineering*, Lond., Editorial Secretary of; Chesterfield Hospital, Secretary of; Chelsea Guardians, Clerk to the; Dr. C. C. Clausen, Hamburg; Chelsea, Medical Officer of Health of.

D.—Dr. George Dale, Lond.; Mr. Percy Dunn, Lond.: Derbyshire Royal Infirmary, Derby, Secretary of; Danish Eugenics Committee, Copenhagen, Secretary of; Dr. Leonard Dudgeon, Lond.

E.—Dr. John Eyre, Lond.; Edgar Allen Institute, Sheffield; Ecsōlent Compounds, Ltd., Lond.; Messrs. W. and T. Evans, Cork; Mr. P. Emanuel, Manchester; Mr. Frank Eyre, Lond.; Messrs. A Lecture
ON
THE CAUSES OF INSANITY.[1]

F. W. MOTT, M.D. LOND., LL.D. EDIN., F.R.S.,
PATHOLOGIST TO THE LONDON COUNTY ASYLUMS.

IR. PRESIDENT AND GENTLEMEN,—The increase
nsanity and feeblemindedness is a matter deeply
cerning the race and its future, and a most
turbing factor in the minds of the ratepayers;
l can it be wondered at when we consider that
t year alone (1913) the total cost of maintenance
London pauper lunatics under the control of the
ndon County Council amounted to over three-
arters of a million (£755,198). This does not
lude the cost incurred by the Metropolitan
ylums Board for the housing and maintenance
imbeciles, idiots, and incurable cases of insanity,
iich would raise the annual expenditure to at
ist a million. Soon to this sum will have to be
ded. a fresh charge for the life segregation of
ental defectives—a very necessary procedure
hich from the ratepaying, as well as from a
genic, point of view will well repay the outlay.

The first duty of the State is to prevent disease;
iling that, to cure disease; and failing that, to
olong life and to relieve suffering. Have the
presentatives of the ratepayers in the past
lfilled this maxim, or have they not rather begun
t the wrong end and spent huge sums of money
prolong the lives of the derelicts of humanity in
nnecessarily costly buildings? Asylums have been
uilt at a cost of £300–£500 per bed, and it may
ell be asked whether the money might not have
een more advantageously spent on "brains instead
f bricks." We want to educate the public con-
cience to the value of scientific research, for we
annot hope to prevent or cure insanity or feeble-
nindedness until we know the causes underlying
he diseases of the mind and mental deficiency.

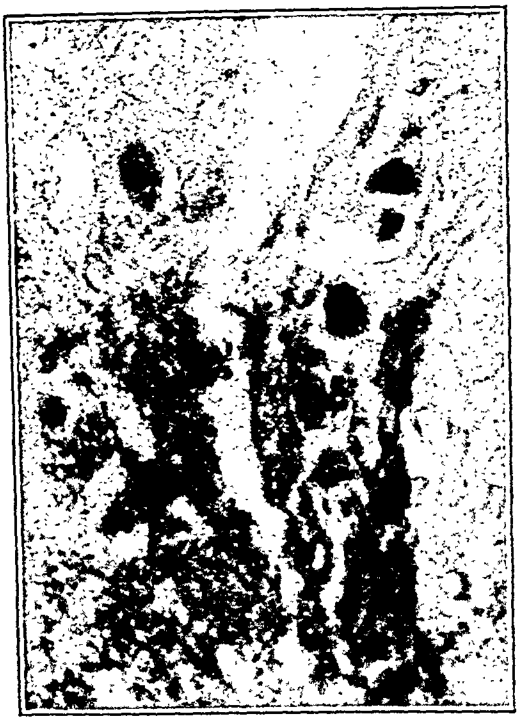
SYPHILIS AND MENTAL AND NERVOUS DISEASE.

The history of the progress of medical science
lemonstrates the fact that the application of the
biological, physical, and chemical sciences to the
study of the causes of disease has led to discoveries
by means of which prevention and successful treatment have resulted. When I was appointed pathologist to the London County Asylums syphilis as a
cause of mental disease was not mentioned in the
reports. My hospital experience had taught me
that it was by far the most important cause of
organic disease of the nervous system; and this
led me to make researches in this subject in respect
to asylum patients. In a few years by dint of constant research, especially by the study of numbers
of the juvenile forms of general paralysis of destruction, and for reasons which I have indicated in my report to the Neurological Section of the International Congress of Medicine and therefore need not go into here, the poison of the spirochætal activity may not necessarily be formed in the nervous system.

Spirochætes in Brains of General Paralytics.

Since the discovery of Noguchi and Moore of spirochætes in 12 out of 70 brains of general paralytics, confirmed by myself and many other observers, any doubt as to syphilis being the essential cause has been dispelled. In fact, in a series of 100 brains of persons dying from this disease I have found the spirochæte in 66, in some cases more numerous than in the primary sore. According to my experience they are more numerous and found with greater ease in cases dying soon after admission. They exist in scattered foci all over the grey matter of the cortex, but especially can they be found in those regions where the earliest signs of adhesions of the membranes occur—namely, the frontal lobes. The colonies are perhaps not more than a millimetre to a few millimetres in size, and when they exist the grey matter has a softer consistence and a pinkish appearance. Microscopically there is more evidence in the neighbourhood of

FIG. 1.



spirochætes by taking a little of the grey matter, rubbing it up in a mortar with salt solution, and examining the emulsion with the dark-ground microscope. If the preparation is made from a brain obtained soon after death the organisms can be seen moving. They differ in no way morphologically from the spirochætes obtained from the primary sore or from a congenital syphilitic organ. By Neisser-Pollak puncture method Förster and Tomaczewski have obtained living spirochætes in the small cylinder of brain removed during life in 40 per cent. of 60 cases. If we had time to search there is no doubt spirochætes could be found in every case; for we know that the cerebro-spinal fluid in practically every case of general paralysis gives a positive Wassermann reaction.

Lesions and Remissions in General Paralysis.

There is reason to believe that the spirochæte enters the central nervous system when generalisation takes place in the secondary period, and it remains latent for a number of years; it then takes on active multiplication with production of toxins resulting in an encephalitis with mental and motor phenomena of irritation. But this encephalitis is accompanied by a neural destruction and a degree of dementia and paresis proportional to the neuronic destruction. We know that then the patient may remain more or less demented a number of years until a recurrence occurs, due no doubt to a fresh development of the parasites, or he may die from some intercurrent disease. Sometimes, however, after an attack of acute mental and motor irritation phenomena, or a loss of consciousness, the patient makes an apparent recovery (without any specific treatment) and is discharged from the asylum, only to return again on account of a recurrence of symptoms. We must suppose that nature itself has arrested the multiplication of the specific organisms by the production of spirillocidal antibodies.

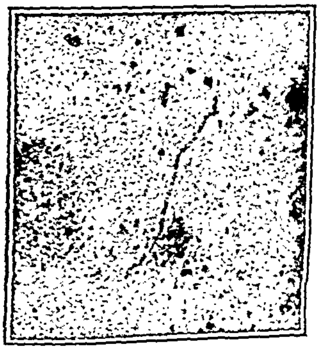
What, then, has caused the recurrence? Either the organism has survived as an extra- or intracellular resistive spore, or the explanation of Ehrlich may be the correct one—viz., some few of the spirochætes are resistive to that particular antibody and remain undestroyed, awaiting a favourable moment of a lowered resistance of the tissues to start multiplying. (Fig. 2.) Owing to the extreme minuteness of this organism it is very difficult to investigate the question of spore formation. An immense number of granules may be seen in the brain and in the proliferative cells of the inflamed perivascular sheaths; these may be spores, but I am inclined to think they are granules shed by the spirochætes which are undergoing plasmolysis. Occasionally, however, I have seen in sections and films spirochætes stretched out with granules in their interior (*vide* Fig. 2).

If these cases with remissions had been treated by any of the numerous spirillocidal methods of intravenous or intrathecal injections of arsenobenzol compounds they would have been claimed as therapeutic cures. Candidly I do not think any marked success has attended any of the methods of treatment so far employed. Indeed, several cases in which I found enormous numbers of spirochætes in the brain had been treated with large doses of salvarsan prior to admission to the asylum. We must then rather look to the prevention of the spread of syphilis and its early diagnosis and treatment by modern methods as the most hopeful way of combating this terrible malady.

Incidence of General Paralysis.

Of the total admissions to the asylums of the County of London every year about 10 per cent. are general paralytics; more than 15 per cent. of the male admissions are general paralytics, and these are recruited from men of all social grades who, prior to the onset of the disease, for the most part were efficient and productive social units of civic worth and capacity. True, the females are largely recruited from the unfortunate class of women, many of whom are mental defectives. Many of the women so affected have been driven to prostitution by seduction, desertion, and destitution, but by no means all female paralytics are immoral women, for a good number are the innocent wives of men by whom they have been infected and who are unaware of the real cause of the disease. Moreover, the histories of the families of paralytics show that not infrequently they have transmitted syphilis to their offspring. Incidentally I may remark that of the 60 juvenile paralytics I have collected in 20 per cent. one of the parents, usually the father, was a paralytic.

FIG. 2.



Film of brain emulsion stained by Fontana's method, showing spirochæte which has lost its coils and is filled with granules. (Magnified 1400 times.)

I have made an inquiry regarding the incidence of general paralysis in the two sexes in London parishes,[2] and I have found that the females are relatively more numerous in the poorer East-end parishes, and there is a correlation between female paralysis and degraded poverty. Now it is interesting to note that the higher you rise in the social scale the less often do you meet with general paralysis in the female sex. This is not the case with the male sex. In the juvenile form, where the chances of syphilitic infection are equal, the sexes are equally affected. The incidence of general paralysis in a population is a measure of the incidence of syphilis.

In connexion with the different class of female to male affected by this disease and the large number of female general paralytics who are prostitutes, I may mention that these facts may be correlated with observations I made some years ago on the convolutional pattern of the brains of male and female paralytics; for I was struck by the fact that, as a rule, the male paralytic generally possessed a well-convoluted brain of above the average, whereas the female paralytic possessed very frequently a small brain of simple convolutional pattern indicative of an imbecile.

Economic Considerations.

If it were not for the fact that there is no accumulation of general paralytics in the asylums, as the death-rate equals the admission-rate, the cost of maintenance from this disease alone would be enormous. But it must be remembered that many cases of organic dementia, imbecility, idiocy, epilepsy, and brain-softening are due to syphilis. Moreover, it is the most potent cause of nervous disease—e.g., tabes is always syphilitic, hemiplegia, paraplegia, and likewise aphasia are very often due to syphilis; and the sufferers with these diseases do not die in a short time, as is the case in general paralysis, but have to be maintained for numbers of years in asylums, infirmaries, and institutes for incurables. Numbers of other incapacitating diseases due to syphilis might be mentioned—e.g., aneurysm and aortic disease.

---

[2] THE LANCET, Nov. 15th, 1913, p. 1374.

As an asset to the nation the value of each individual depends upon the amount of physical and mental work he or she can produce, and the capacity for breeding and rearing healthy children. Now venereal disease, especially syphilis, although in the majority of instances, from its direct effects, it does not prevent a man or woman working, by making them bedridden, nevertheless by direct or indirect effects on the vital organs it diminishes considerably the efficiency and length of productive usefulness of the individual; and in at least 15 per cent. of persons affected by syphilis causes, when no treatment or insufficient treatment is adopted, fatal incapacitating diseases which render the individual prior to death a monetary burden to the State for a number of years, not to mention the great infant mortality and mental and physical disabilities in the offspring that survive. From an economic and productive point of view the State and municipal authorities could save in the end enormous sums of money by a wise expenditure in preventing the spread of this disease and by promoting cure in the early stages, thereby preventing generalisation in the blood and lymph streams and infection of the central nervous system. Those of my readers who are interested in the subject of general paralysis of the insane in the light of recent research I would refer to my article on the Nature of the Condition termed Parasyphilis.[2]

storehouse of memory of experiences are there. And it is an interesting fact that just as there is a similarity in the bodily formation and physiognomy of relatives, so there is a similarity in the folds and fissures forming the convolutional pattern of the brain. "Like tends to beget like" in the morphology of the organ of mind.

It is not surprising, therefore, that my observations, based upon a large amount of material and investigations, lead me to form the conclusion that the principal causes of mental deficiency may be summed up in the fact that, as regards the functions of the organ of mind, "like tends to beget like." Although occasionally in a family where mental deficiency is not expected an idiot or an imbecile is born (and in such cases not infrequently we obtain a history of syphilis or alcoholism or both in the parents), mentally defective children, particularly if more than one occurs in a family, are usually the offspring of parents who are imbecile or of low-grade mentality.

Inquiry as to Mental Deficiency and Insanity.

I have instituted an inquiry regarding mental deficiency and insanity. As the subjoined table shows, 2074 insane parents in the London County asylums had 4430 children under 16, 3543 being of school age. Among these there were 50 children in the mentally defective schools. This gives only a percentage of 2·1 of insane parents with mentally defective children, and a percentage of 1·4 children of insane parents of school age who were mentally defective. A considerable, but as yet unascertained, percentage of these children owe their mental deficiency not to a germinal hereditary defect but to congenital, pre-natal, or post-natal causes.

Number of children over school age	355
,, ,, of school age	3543
,, ,, under school age	532
Total number of children	4430
,, ,, parents	2074

Average number of children under 16 years of age to each parent = 2·1.

Number of mental defectives = 50 out of 4430 = 1·1 per cent environmental causes of degeneracy. The number of grandparents affected supports the truth of Morel's doctrine on the intensification of mental deficiency in successive generations, which theory is supported by my statistical results of anticipation or antedating in the case of insanity, which is the tendency to the occurrence of the mental disorder at an earlier age and in a more intense form in successive generations; this will be considered more fully later.

THE RACE POISONS IN RELATION TO DEGENERACY.

Although mental deficiency is not limited to any social grade, and an idiot or imbecile may even sometimes crop up unexpectedly in a family in which both maternal and paternal stocks are apparently sound, yet as a rule it is the sediment of our large overcrowded cities and the rural districts where feeblemindedness is most to be found. "Birds of a feather flock together," and among the lower inefficient grades of society there will always be a tendency for people of feeble intelligence, weak will-power, slender sagacity, and deficient moral sense to mate and breed. The social environment is necessarily bad and unhygienic; consequently they are very prone to be affected by the race poisons—syphilis, alcohol, and tuberculosis—which tend to an increase of the bodily and mental deficiency in the next generation. In this way it is possible that these race poisons may tend to weed out poor types, but it is also probable that they tend to produce poor types.

It may be a biological heresy, but it is firmly rooted in the minds of practising physicians that a chronic saturation of the blood by the race poisons, specially when operating in successive generations, can *per se* cause degeneracy in healthy stocks by a pathological mutation of the germ plasm. Biologists may assert that one is assuming an acquired character can be inherited, and you must prove that the poison is not acting on the individual by reviving a latent neuropathic taint. I admit the great difficulties attending a proof that would satisfy some eminent authorities, still Galton himself admitted the possibility of continuous saturation of the blood by poisons modifying the germ plasm, and Professor Arthur Thomson in his work on heredity comes to this conclusion.

If we consider the matter from a physiological point of view it may be assumed that a chronic blood poisoning would disturb the biochemical interrelations of all the organs of the body, including the ductless glands and the sexual organs. It cannot be supposed that the continuous disturbance of the normal biochemical dynamics of so complex a mechanism can have no effect, after its operation in successive generations, upon the specific energy of the master tissues, germ cells and brain cells, seeing that they are supplied by the same blood and lymph as the rest of the organs and tissues of the body. My investigations of pedigrees of the insane and the feebleminded certainly support this conclusion. Many pedigree charts of defectives show a drunken mother or father, but particularly the former, with a family of healthy or comparatively healthy firstborn; then as the effects of the poison become intensified the later born children are either dying in infancy or mentally defective. Every effect owns a cause, and it seems as reasonable to attribute degeneracy to specific nutritional deficiency of the germ cells brought about by environmental agencies as to call it spontaneous variation. However, I have two pedigrees (Figs. 3 and 4) which are almost of the nature of an experiment which, so far as is possible, afford proof of my proposition. One relates to a woman who had two husbands, the other to two brothers who married two sisters.

Although higher-grade imbeciles are deficient in intellectual and moral qualities they are not deficient in animal propensities, and they are very fertile. Large families are the rule, but owing to the race poisons, maternal ignorance, and neglect, the infant mortality is proportionally high, so that the average number of surviving children attending the schools only exceeds by a trifle the average number in families in which all the children are in the normal schools.

CAUSES OF PSYCHOSES OR TRUE INSANITY.

Having thus given some consideration to the causes of mental defect and mental diseases with recognisable morphological defects or destruction of the organ of mind (amentia and dementia), I will pass on to the consideration of the causes of the true psychoses or disorders of mind, in which so far no adequate explanation by morphological changes in the brain exists.

The causes of these functional disorders fall into two groups: (1) the toxic, and (2) the degenerative (neuropathic), but, of course, the two conditions are more often than not combined. The toxic causes are (*a*) exogenous, and (*b*) endogenous. The field of inquiry concerning the latter (endogenous) compared with the former (exogenous) is beset with many difficulties, because the source and mode of introduction of poisons from without can be ascertained, whereas the genesis of the endogenous poisons is much more obscure and complicated by the general disturbance of the biochemical harmony of the physiological interrelations of the organs of the body. Indeed, many of the pathological conditions, bodily and mental, which arise from the introduction of poisons into the body, especially when they are taken habitually, are due not only to the poisons introduced from without, but to microbial poisons and the toxic products caused by disorders of alimentation, of metabolism and of inefficiency of elimination of waste products with the installation of a vicious circle.

Time does not permit of my dealing fully with the intoxication insanity brought about directly by alcohol and lead acting as principal factors. I may, however, remark that the characteristic true alcoholic psychosis (Korsakow psychosis), and regarded by Kraepelin as chronic delirium tremens, is not a common class of case in our asylums, and I have but seldom found cases in the post-mortem room. Alcoholic insanity is more often transitory and the cases are intercepted in the infirmaries. Although alcoholism plays an important part in the degeneracy of a stock, yet as the sole cause or even the principal cause of a large proportion of *admissions to asylums* I am very sceptical; indeed, I have brought forth a mass of evidence, clinical, pathological, and statistical, to show that a relatively small quantity of alcohol, the quantity which is taken daily by many physicians, magistrates, and pillars of society generally without any apparent harmful effects, is quite sufficient to make a potential lunatic or epileptic antisocial, and thereby necessitates segregation.

Neuropathic Inheritance.

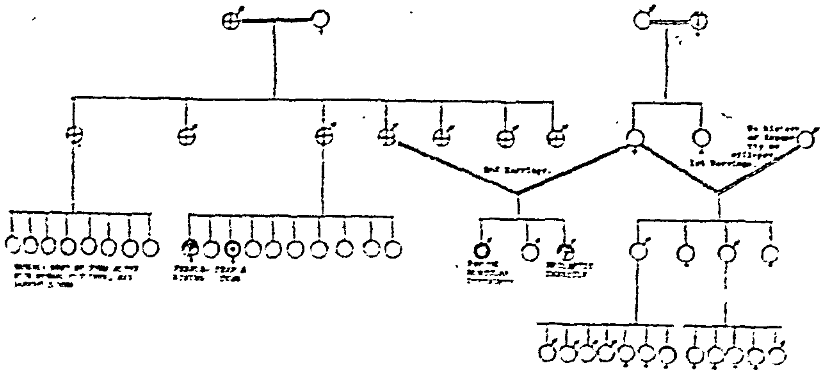
I do not wish to imply that alcohol is not a potent evil to society, for I am in entire agreement with Sullivan's conclusion in his work on "Alcoholism."

"To sum up, then, we find that the extent of the alcoholic evil is represented by a considerable contribution to the amount of suicide; by a share in the causation of crime, which though small in relation to the total mass of delinquency, is of extreme importance by reason of the specially grave character of the offences comprised in it; by a comparatively small part in the causation of insanity; and, lastly, by an indefinite but certainly reproduction and occurring especially at the critical periods of life—namely, early adolescence and the involutional period, and also in the female during the puerperium, parturition, and lactation.

EVIDENCE OF ANTEDATING.

From these facts it may be deduced that the neuropathic inheritance and disorders of the functions of the sexual glands play a dominant part in the causation of the true insanities. For years past I have been studying the neuropathic inheritance by means of pedigrees made by myself and collaborators, also by means of the card system of a collective investigation of nearly 4000 relatives who are at present in or have been discharged from, or who have died in the London County Asylums, and I have observed that there is, as this graph shows, a marked correlation between the age at onset of insanity and the critical periods of sexual life. In the insane parents of insane offspring you will observe that the maximum is at the involutional period of life. in the offspring it is at the adolescent period. under 25.

FIG. 3.



This pedigree relates to a woman with two families. By her first husband, with no history of the neuropathic taint in his family, she has healthy children and grandchildren, many of whom are grown up. She then married a man who was a drunkard, one of a family of drunkards; his father was a drunkard. One of his brothers, a drunkard, had ten children, and of these one was deaf and dumb and another an imbecile, otherwise there was nothing in the family indicating a hereditary taint. The offspring of this woman by the second husband were as follows: a boy with pseudo-muscular dystrophy, a normal boy, and a feeble-minded epileptic imbecile. A glance at the pedigree seems undoubtedly to show that the father's germ plasm was accountable for these defects, and drink in successive generations the probable cause.

dans la folie à un âge plus jeune que leur père par une sorte d'accumulation."

Now, granting that Professor Pearson's conclusions are right and that my statistics show no antedating, I would remark that numbers of pedigrees which have been taken by myself and independent observers show this tendency in successive generations for the insanity to occur at an earlier age in an insane stock. Professor Pearson in one way does not deny the fact that there is a tendency for an insane stock to be either ended or mended, which is really the practical point which we have to decide, for he says: "In the case of insanity is the man or woman that develops insanity at an earlier age as likely to become a parent who develops it at a later age? I think there is not a doubt as to the answer to be given. Those who become insane before 25, even if they recover, are far less likely to become parents than those who become insane at later ages; many of them, considering the high death-rate of the insane, will die before they can become parents of families." But the objection which Professor Pearson raised does not apply, it seems to me, when a comparison is made between the age at onset of insane offspring of insane parents with all the admissions to the asylums, and a graph can be constructed very similar in many respects to that obtained when the comparison of offspring and parents is made.

Histological Changes in the Ovaries in Dementia Præcox.

Now, it is an interesting fact that in certain types of insanity, especially the primary dementia of adolescence, there occur in quite young females a great diminution of ova, signs of absence of maturation of the ova, and marked fibrosis of the gland. I consider this to be further evidence of "anticipation," by which the children of insane parents are affected at a much earlier age than the parents and in a more intense form. Dr. Laura Forster has been working in the laboratory at Claybury for the past two years on the histology of the ovaries of 100 cases of females suffering from different forms of insanity and dying during the child-bearing period of life. Her observations strongly support the view I have put forward regarding the early involution change of the ovaries in dementia of adolescence.

The observations of Ceni support the conclusion that there is a close functional correlation between the brain and the reproductive organs. He removed one hemisphere from hens; the birds surviving traumatic shock were killed after periods varying from a few months to three years, and their ovaries were subsequently examined histologically. The primary shock had the effect of causing them to cease laying eggs for a few months. In the following year they began to lay again, but in the second year fewer eggs were laid or they ceased altogether from laying. The birds were otherwise healthy. Microscopic investigation of the ovaries showed a premature progressive involution. Ceni infers from these experiments that intimate dynamic relations exist between the brain and the reproductive glands. It is more difficult to show changes in the male sexual organ, and at present an investigation is being made. The masturbation which so frequently occurs may interfere with the results.

Psycho-Physiology of the Sexual Glands and Brain.

Now let us regard the question from a psycho-physiological aspect. In the insanity of adolescence are the brain and sexual glands simultaneously functionally disordered, or is the deficiency and disorder of the one the cause of the derangement of the other? It has long been recognised by alienists that the primary dementia of adolescence may arise from an auto-intoxication possibly of sexual origin. In women it coincides with menstrual disorders. The reality of the auto-intoxications is demonstrated by vaso-motor disturbances, febrile attacks, digestive troubles, furred tongue, nausea, and pyrosis, which frequently occur at the period of onset of the attack; but this, to my mind, explains nothing, because these symptoms of auto-intoxication are common conditions in insane persons. But let us consider the question from a biological standpoint. The germ cells are the transmitters, not merely of morphological characters, but also of the raw material of mental characters of ancestors. There may be a failure of specific energy of the germ cells, and this dynamic deficiency shows itself in the two master tissues, sexual glands and brain, at the time when all the latent energy of these organs is stimulated to a supreme effort for the reproduction of the species.

Biochemistry and physiological experiments are throwing a new light on the intimate and subtle functional association of all the organs of the body brought about by the internal secretions or hormones, specially those of the ductless glands, which we know play an important rôle in the metabolism, growth, and functional activity of the central nervous system. In proof of this I need only mention the known facts concerning the thyroid glands and their absence in relation to cretinism and myxœdema, and of hypothyroidism and hyperthyroidism in relation to certain nervous and mental disorders especially affecting women. Again, there are certain forms of disease of the pituitary body which are associated with abnormalities of the sexual organs; besides there are other facts based upon clinical observation and experiment showing the correlation of function between the sexual glands and the pituitary body which I need not dwell upon here, but they suffice to support the view that hormones produced by the sexual glands may serve, not only to excite the growth of the secondary morphological sexual characters, but to arouse in the central nervous system the vague instinctive desire connected with the sexual appetite.

All the higher as well as the baser sentiments have their roots in the desire for propagation even more than preservation, for Nature is unmindful of the individual, mindful only of the species. Painting, sculpture, poetry, music, literature, and the drama owe their inspiration and fervour to the sexual passion, yet social conditions, traditions, and customs conspire to throw a veil over the tree of life, the openly expressed knowledge of which has been regarded as forbidden fruit. Modern social conditions tend to repress or suppress the natural physiological gratification of the sexual passion, especially in women. When this happens the desire is not suppressed, but causes a silent undercurrent of sexual passion which, although it may not be manifest to the external world, nevertheless occupies a large place in the conscious and subconscious self; it suffuses silent thought and consciousness with an emotional tone which may find outward expression in æsthetic or religious observances or fanatical agitation; its suppression is one of the causes of insanity, especially in subjects with the neuropathic taint, for it tends to continue mental depression and the instatement of an anxiety-neurosis which in its turn leads to a disorder of the vital functions and a disturbance of the biochemical relations of the whole body, causing an auto-intoxication; thus a vicious circle may be established by the interaction of a disordered mind and a disordered body.

Evolution of Character in Man.

The raw material of character possessed by every individual is a complex of the characters derived from species and sex—the outcome of evolution, and fixed and organised by heredity, but modified by special racial and family traits. All stable foundations of character have their roots in the desires, emotions, and instincts connected with preservation of the individual and the species, but modified in accordance with the functional and bodily differences of the two sexes. They are the oldest phylogenetically and ontogenetically; they are common to all human beings, and are the main source of all human activities. This fact has been poetically expressed by Schiller in the following lines:—

> Durch Hunger und durch Liebe
> Erhält sich die Weltgetriebe.

The special racial and family characters are of later development, therefore are less fixed, stable, and organised in the nervous system, consequently are more liable to mutation.

The last to come are the family characters, which are most subject to mutation and therefore most influenced by adaptation to environment and sexual selection in the struggle for existence. The character of the civilised man, which places him above the primitive savage, is mainly due to racial and family characters which by the evolution of language and the use of the hand as an instrument of the mind have built up the great social heritage which he utilises in the preservation of the individual and the species. Occasionally, for no known reason except atavism, we find an idiot born of intellectual parents. As there is no danger of propagation it does not much matter. In the feebleminded, like the savage, the animal propensities constituting the roots and stem of the tree of life are vigorous for propagation; but the fruits, intellectual and moral, do not ripen sufficiently to be of any productive value; consequently, like weeds, they tend to use up nutrition, materially despoiling the fruitful trees and contaminating the social heritage. The constantly expanding social mind colours the hallucinations, delusions, illusions, obsessions, and phobias of the insane civilised human being, thereby obscuring the real source of the mental disorder, which lies deep down in the roots of character, connected with a germinal inborn failure of the harmonious interrelation of the biochemical processes of organs, the normal functioning of which is indispensable for the appetites, desires, instincts, and

and witchcraft, the fear of natural phenomena, which they cannot explain, enters largely into their mentality. P. C. J. van Brero, who has had a long experience at Lawang Asylum, Java, points out the difficulties of obtaining information regarding the prevalence of different forms of insanity among primitive and semi-primitive peoples, and of appraising the value of such accounts as exist by various writers, owing to their using a different nomenclature. Nevertheless, it appears that they suffer, although to a less extent and with a different colouring, the same forms of insanity, and apparently the primary dementia of adolescence, dementia præcox, is the commonest form.

Among these people it cannot be an effect of the non-gratification of the sexual instincts, owing to failure of opportunity occasioned by social conditions; yet its appearance in individuals in early adolescence, who up to the time of puberty were normal, points to some intimate relation of the disease to the sexual functions. We know that this form of insanity is evidence in most cases of an ancestral neuropathic taint. In a large proportion of the cases of insane parents and offspring which I have collected I find the offspring are suffering with this form of insanity. In 80 per cent. of the cases of dementia præcox the onset occurs before 25. In cases where there are two or more members of the same co-fraternity suffering with insanity it is nearly always this form of insanity of adolescence, and it frequently terminates in dementia. It is noteworthy, too, that in a large proportion of cases the age of onset of the offspring of insane parents is the same or within a few years of the same. This corresponds to family nervous diseases. The sexes are about equally affected. Over-pressure at school and college is often (I think erroneously) attributed as the essential cause of the disease, although I do not deny there is not infrequently a history of such over-pressure. Again, masturbation is very common, so much so that it is thought to be the cause of the onset of the disease and of the anergic stupor that so commonly occurs in these cases, but it is more probable that this is a sign of the disease and not a cause.

Now it is very interesting to note that up to the time of puberty the majority of patients affected by dementia præcox have been intelligent individuals and full of promise. Aschaffenburg, cited by Christain, gives the following proportion per cent. of dementia præcox: 27 men and 21 women were of an average intelligence prior to the onset; 55 males and 65 females were intellectually good and even remarkable; 18 males and 13 females presented a psychic development below the average without, however, being idiots or imbeciles. These and other statistics tend to show that there is not a congenital feeblemindedness but some germinal defect, possibly of durability of the sexual glands, which has a profound influence on the function of

THE TREATMENT OF ANKYLOSTOMA ANÆMIA.

BY H. B. DAY, M.D., B.S. LOND., M.R.C.P. LOND.,
PROFESSOR OF CLINICAL MEDICINE, EGYPTIAN GOVERNMENT SCHOOL OF MEDICINE.
With a Note by
A. R. FERGUSON, M.D., C.M. Glasg.,
PROFESSOR OF PATHOLOGY, EGYPTIAN GOVERNMENT SCHOOL OF MEDICINE.

ON taking over charge of the medical wards in the large Cairo Hospital of Kasr-el-Ainy some years ago I was struck by the varying and often disappointing results of treatment in the large number of cases of ankylostomiasis admitted, which approach 400 annually. Since the outstanding symptom of this disease is anæmia, I instituted regular blood examinations in each case to test the efficacy of the treatment adopted.

My observations are based on a study of over 300 cases. These all represent patients severely ill with ankylostomiasis and not simply harbourers of the parasite or cases of ankylostoma infection, to follow the distinction made by Boycott.[1] So long as no serious degree of anæmia is present the average Egyptian peasant (fellah) is usually able to continue work and does not apply for hospital treatment unless suffering from some other disease. A fall of hæmoglobin below 50 per cent., however, is a serious handicap on exertion, but the fellah generally delays until he is entirely incapacitated before journeying to hospital. Thus I found in my series that the average hæmoglobin value on entry was only 22 per cent., and in one-fifth it did not exceed 10 per cent. That patients can get about with such intense anæmia must be ascribed to the increase of blood volume described by Haldane, so that the total deficiency of hæmoglobin is considerably less than appears. The average colour index was reduced to 0·4. I have never yet seen a case of ankylostomiasis in which the high colour index typical of pernicious anæmia was approached, though instances have been reported.[2] For the hæmoglobin estimation I at first employed Oliver's instrument and his daylight reading scales, but I now use Talquist's simple method, which is sufficiently accurate and time-saving.

Long before the parasitic cause of endemic anæmia was discovered patients were treated with iron in the hope of benefiting this chlorotic type of anæmia. Dock and Bass[2] narrate instances from the Southern States where decided, though only temporary, improvement resulted. In my series I have only met with one case of pure ankylostomiasis in which a slight improvement did follow the administration of iron before any worms were expelled. (Chart VI.) This failure may be due to the severity and long duration of the anæmia in hospital patients. Yet cases of severe secondary anæmia due to loss of blood in bilharziasis commonly show decided improvement on hæmatinic treatment, although the hæmorrhage from bladder and intestine can rarely be arrested. However, rest in bed and attention to diet probably do much to relieve the drain on the system and to enable the bone marrow to make good the loss. From the point of clinical diagnosis it may be stated that a marked anæmia dependent on no obvious cause, and which resists hæmatinics, is almost invariably due to ankylostomiasis in this country. The successful treatment of such patients depends primarily on a correct diagnosis and the expulsion of the ankylostoma worms. In every case of anæmia the stools are examined for ova by the microscope, and if none be found a culture is made and the result noted after an incubation of five days at summer temperature to obtain developed larvæ. When time is important the centrifuge method described by Dock and Bass for isolating ova from stools may be used. Examination of the blood for eosinophilia is of little value in this country where all forms of helminthiasis are rife. The choice of anthelmintic, the dosage, and the method of administration vary with different physicians. The careful work of Schüffner and Vervoort[3] on a large scale at Delhi gave the following results for a single administration, and is in harmony with the experience of most other workers:—

Drug.	Dose.	How given.	Worms expelled.
	grm.		Per cent.
Thymol.	5	One gramme two-hourly. Followed by castor oil.	83
Beta naphthol.	3	As above.	63
	4	As above.	74
Eucalyptus. Chloroform. Castor oil.	3 3·5 40	Mixture. In two portions at interval of half an hour.	33
Oleum chenopodii.	3	In three doses of 16 drops on sugar every two hours. Followed by castor oil 17 grm. with chloroform 3 grm.	91
Oleum chenopodii.	3	As above, but without castor oil and chloroform.	84

Personally I generally use a mixture of thymol (3 to 4 grm.) with beta naphthol (3 grm.). The addition of beta naphthol reduces the dose of thymol necessary and ensures a thorough breaking up of the crystals, which often tend to pack together in the cachets. Oleum chenopodii is expensive and has a peculiarly disagreeable flavour, most repulsive to patients, so I have not persevered with its use.

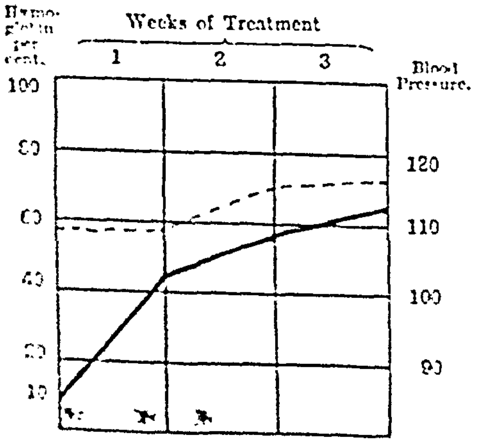
Whatever drug be chosen as vermicide, a preliminary preparation of the patient by fasting and purgation is strongly advisable. The usual course consists of milk diet for one day, with a saline purge in the evening in order to free the upper intestinal tract from food and mucus and so expose the worms, which often lie buried. The vermicide is then given early the next morning on an empty stomach in divided doses and the drug swept out by a second purge two hours after the last dose. Until this is finished the patient is kept in bed.

In order to free the intestine of the worms it is usually necessary to repeat the vermicide, often several times. Ashford and King at Porto Rico found two courses generally sufficient; Sandwith in Egypt averaged 2·6; and Dock and Bass found over three courses necessary in half their patients. It is advisable to allow from four to seven days to elapse before the treatment is repeated. Personally I prefer the shorter interval, as it favours a cumulative effect of the drug on the worms. When practicable the stools are examined for the worms expelled after each course, and when no more are forthcoming a microscopical search for ova is made to see if any (female) worms remain. This should be deferred until some days after vermicidal treatment, since the drug may temporarily disable the egg-laying capacity of worms without killing them. Since it is more important to know whether worms remain than the number of those discharged. I consider this search imperative and cultivate the stools whenever possible, to obtain a certain result. When the worms prove resistant to one vermicide, it is advisable to employ an alternative drug.

Expulsion of the worms is followed by gradual disappearance of the anæmia in most cases of ankylostomiasis. The rise of hæmoglobin is more often irregular than uniform, depending on the proportion of worms got rid of by successive doses of vermicide. A decided improvement is commonly seen after the second dose; for if a patient has 300 worms, for example, 200 of which are expelled by the initial dose, the 100 that remain are generally sufficient to maintain the anæmia. As a rule, a rise in the number of red corpuscles precedes the rise of hæmoglobin, and the number of corpuscles reaches normal long before the hæmoglobin standard is attained. This response to anthelmintic treatment occurs readily in young and vigorous subjects recently infected. But in the severe chronic cases that form the majority of hospital in-patients, satisfactory improvement may not occur or may be delayed for some months. Hence the patient is not conscious of any benefit accruing from his stay in hospital, and, owing to the liability of reinfection after discharge, may be none the better for the treatment.

In order to obtain a rapid cure of the anæmia in moderate cases, and to get any decided improvement in severe cases, hæmatinic treatment is generally essential. Since the anæmia is of a marked chlorotic type the administration of iron is strongly indicated to supply the deficiency of hæmoglobin. Under the influence of iron a rapid amelioration is usually seen, even in patients with severe anæmia, and before all the worms are expelled. There is generally an immediate rise in hæmoglobin value of from 20 to 30 per cent. in the first week, and a slower increase later. A typical case is here shown (Chart I.).

CHART I.

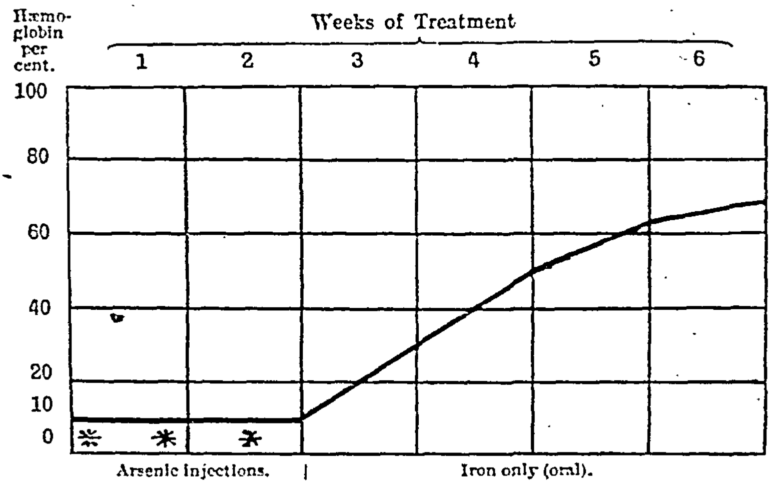


Case No. [illegible].—Male, aged [illegible]. [illegible] rise of hæmoglobin [illegible] blood pressure [illegible] [illegible] administration of vermicides.

In young subjects with vigorous bone marrow the transformation in appearance is startling. In one such patient a single dose of thymol and the administration of reduced iron raised the hæmoglobin value from 10 to 60 per cent. in one week. This increase may be partly explained by a rapid reduction of the hydræmia shown to exist by Haldane, with concentration of the blood elements. But the rise of hæmoglobin in such cases treated with iron is proportionally greater than the rise in the number of red corpuscles, so that the colour index rises quickly, pointing to a high degree of activity on the part of the bone marrow. This is rarely seen when iron is withheld, the colour index remaining low for a long time.

Chart II. shows the usual result of withholding iron in a severe case. Although all the worms had been expelled and arsenic given, no rise of hæmoglobin occurred until iron was substituted, when the response was immediate.

CHART II.



Case No. 176.—Male, aged 39. Asterisks denote administration of vermicides. All worms expelled.

An interesting case is shown in Chart III. Here iron and arsenic were given at first for just three days, with immediate benefit, but were afterwards omitted. In spite of the complete expulsion of worms the hæmoglobin value actually sank, but rose again rapidly as soon as hæmatinic treatment was resumed.

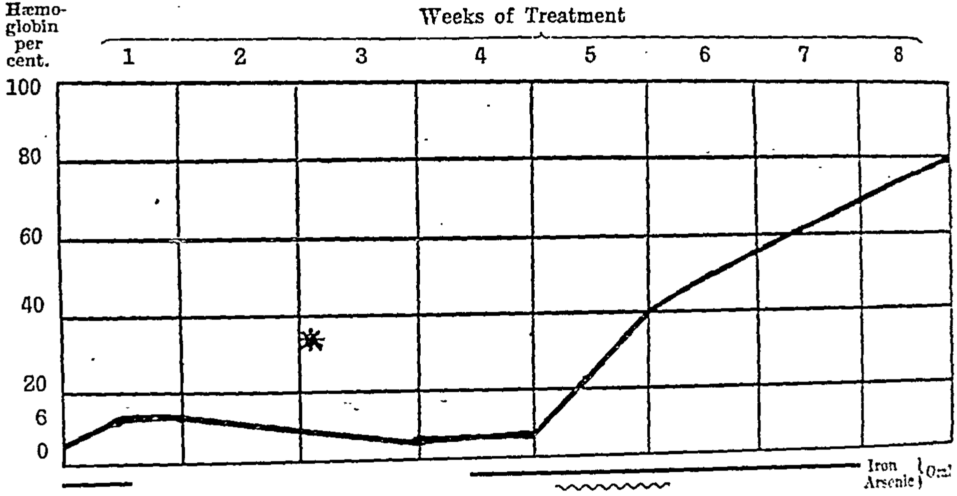
When iron is given from the first, any rise in hæmoglobin value is a most useful guide to the expulsion of the worms. A halt on the upward curve generally means that worms still remain and that further anthelmintic treatment is necessary as shown in Chart IV.

Methods of giving Iron.

The organism quickly responds to iron as a rule, and the form in which it is presented makes but little difference. Comparative tests in my series showed that the stronger forms are well taken and give the most satisfactory results. Thus reduced iron, ferric perchloride, and ferrous sulphate yield an average hæmoglobin increase of from 9 to 15 per cent. weekly, the difference depending largely on individual powers of recuperance. The carbonate of iron (Blaud pills) and the ammonio-citrate are slightly inferior in action, perhaps owing to their styptic properties.

Organic compounds present no advantages over the simple forms of iron. Preparations of hæmoglobin are generally useless; any improvement that may occur under their administration would seem to occur equally well without. Manganese is similarly ineffective as in chlorosis.[4] By the courtesy of Dr. J. Lyn Dimond[5] and of Messrs. Oppenheimer, of London, I was enabled to test a colloid preparation of iron. This was ineffective in the very small doses that can ordinarily be given hypodermically, although large doses like those of citrate have some effect. However, since oral medication is so satisfactory in ankylostoma anæmia, special methods of administration of iron are uncalled for.

CHART III.

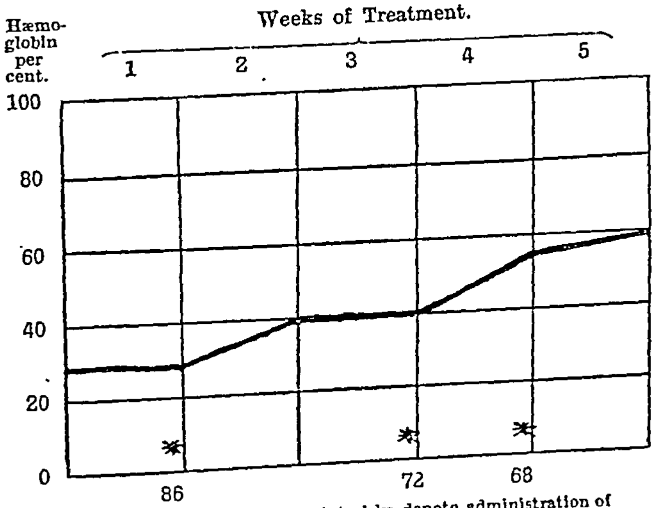


Case No. 211.—Male, aged 25, severely ill with much œdema but no albuminuria. Asterisk shows date of complete expulsion of worms. Lines below denote administration of hæmatinics.

Eosinophilia.

The anæmia characteristic of ankylostomiasis has already been described briefly; a few remarks may be added on the eosinophilia which is nearly always present. This is a characteristic feature of worm infections in general, and occurs in response to the absorption of their products. When worms live free in the intestine the absorption of this material by their host is often small, and eosinophilia may be slight. But when the worms live in the tissues of the host (e.g., trichiniasis, bilharziasis) the absorption is much greater and the eosinophilia pronounced. It then varies directly with the number of living worms present, and inversely with the degree of anæmia existing at any time.[6] In ankylostomiasis, when the worms are settled in the intestine, their relation to the host is intermediate between these two classes. There is usually a high eosinophilia in the early weeks of infection, which falls when the responsive powers of the marrow are impaired by chronic anæmia. On treatment by vermicides the eosinophilia, if high, falls with expulsion of the worms; but if the eosinophilia be low it may increase when the anæmia improves. Thus in many cases the eosinophilia may fall at first following expulsion of worms and rise again later owing to the improved reaction of the marrow to any that remain. Persistent eosinophilia lasting for months or years after the complete expulsion of worms is not uncommon, and is probably due to the presence of larvæ from dermal infection, which may remain for years arrested or wandering in the tissues, and never reach the intestine.

CHART IV.



Case No. 33.—Male, aged 35. Asterisks denote administration of vermicide; the figures give the pulse-rate. At the end of the second week ova were still found in the stools.

Other Symptoms.

The rapid improvement in the blood condition brought about by successful treatment is followed by a disappearance of the various subjective symptoms, such as headache, neuralgic and joint pains, palpitation, and epigastric pain. But while the anæmia may be quickly relieved the symptoms commonly continue for some weeks afterwards. Such organic changes as fatty degeneration of the heart muscle, for instance, take months rather than weeks for recovery.

My assistant, Dr. Garas, kindly estimated the blood pressure in a series of cases under treatment. He found a distinct rise to follow the rise in hæmoglobin value (Chart I.). Another good sign of progress is the reduction in a rapid pulse-rate, as is shown in Chart IV. In cases of "ankylostoma kidney," where there is profound anæmia, general anasarca, and deficient urinary excretion with little or no albuminuria, striking results may be obtained. Such a case is seen in Chart III., where the daily amount of urine rose from 500 c.c. to 5000 c.c. during the rapid improvement in the anæmia.

Refractory Cases.

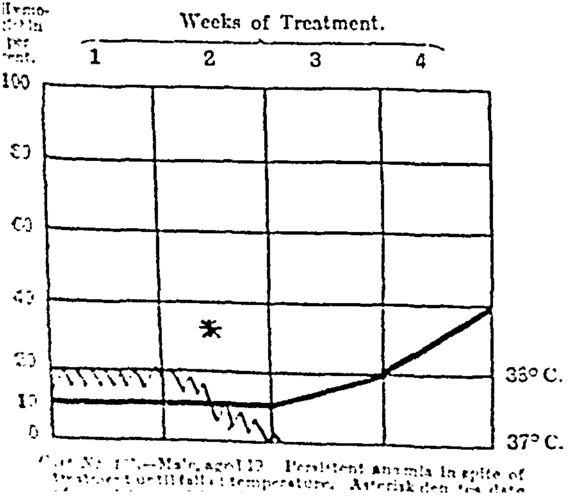
In a certain proportion of chronic cases of ankylostomiasis which have undergone the routine treatment by vermicides and iron improvement may be wholly absent or may be only partial. A somewhat slow rise of hæmoglobin to about per cent. is often obtained with no sub- uent improvement. The causes of total or tial failure generally come under the following ds:—

a) *Persistence of worms.*—After worms have been pelled, their non-appearance in the stools after eated doses of vermicide is no proof of a com- te clearance. Careful examinations of the ols for ova, as already described, are necessary make certain. A few male worms may of course ape detection, or there may be immature forms sulting from dermal infection arrested in the sues, but it is tolerably certain that these are productive of anæmia.

(b) *Complicating diseases.*—Of these, chronic arrhœa (generally due to intestinal bilharziasis) d parenchymatous nephritis are, in this country, e most serious complications that aggravate æmia. *The constant drain on the system is* t sufficiently relieved by the removal of anky- stoma worms to permit of a good recovery. ellagra, endemic cirrhosis (Egyptian splenomegaly), d bilharziasis commonly complicate ankylosto- iasis in Egypt, but do not retard recovery unless ey have reached a very advanced stage.

(c) *Fever.*—So long as there is fever rising over 00° F. from any cause the administration of hæma- nics is powerless to affect the anæmia. In some ases the fever is due to a specific cause such as alaria, while in others it appears due to secondary nfection at the sites of bites in the intestine. This atter variety seems relatively more common in hildren, and is best treated by anthelmintics. o soon as the fever subsides a satisfactory improve- nent is the rule, as shown below.

CHART V.



[illegible]—Male, aged [illegible]. Persistent anæmia in spite of treatment until fall of temperature. Asterisk denotes date [illegible]

these patients have comparatively few worms present, so that absorption of a toxin produced by the worms cannot explain an anæmia persisting after their removal. The theory of hæmolysis due to a secondary bacterial infection at the sites of the bites rests on no secure foundation of clinical or post-mortem evidence,[7] [8] and the blood changes are essentially different in nature and progress from those characteristic of pernicious anæmia. In this connexion the condition of the hæmopoietic system is of fundamental importance, and I am greatly indebted to my colleague, Professor Ferguson, for the following statement.

Note by PROFESSOR FERGUSON.

"The bone marrow of the body exhibits, during the period covered by the earlier stages of ankylostoma infection, a notable degree of erythroblastic and leucoblastic activity. This can, as a general rule, be observed to extend into the marrow of the long bones, and it undoubtedly occurs, though probably it is of shorter duration, in cases of very severe infection. The marrow of the femur shaft becomes transformed into a compact, firm, solid tissue of brownish-red colour throughout the length of the medullary cavity. Little or no trace of the marrow fat is in many cases visible. Examined microscopically, this hyperplastic marrow is specially rich in normoblasts and eosinophiles, examples of active mitosis being frequently observed in the latter class of cell. The marrow eosinophiles at the beginning of this phase of activity are well formed and highly charged with characteristic granules.

"The period of this hyperplastic phase is difficult to determine. Evidence is not wanting to show that in cases of moderate severity it may persist for a considerable time. But in severe cases sooner or later it gradually passes off, the marrow becoming paler, and finally reaching a condition of gelatinous atrophy. This decline in myelic activity is apparent first of all in the long bones, but later also in the ribs. At this latter stage the precursors of the red cells and the eosinophiles are notably reduced. A feature of significance in connexion with the latter is that, with an imperfectly lobulated nucleus, their cytoplasm is very insufficiently supplied with eosinophilic granules. We are fairly warranted in regarding such a condition of the marrow as one of exhaustion, and while regeneration is yet actually possible, a very considerable time will be required for its realisation. It is significant in this connexion that the blood in chronic severe cases of ankylostomiasis frequently contains eosinophile cells of imperfectly matured type and scanty granular content, comparable in all respects to those described above as existing in the marrow."

became an increasingly serious incubus. He had undergone a yearly cure at Harrogate and always with a certain amount of benefit, and various methods of treatment had been used at different times under Dr. Crawford Watson's direction, including cataphoresis and vaccine treatment. He was unable to ride; indeed, he had not been on a horse for three years. This was a very serious disability, since it prevented him from controlling the management of his large farm. He could walk half a mile with pain and difficulty. The pain lasted for some time after the exercise was over, and was so severe that it made him perspire freely. He could with difficulty put on his left boot. At night he was unable to lie on his left side owing to the pain which pressure produced in the hip. If in the night he rolled over during his sleep this pain awoke him. Apart from pressure, there was no spontaneous pain in the joint at night. His general health was good. He had not suffered from rheumatism in the other joints, except slightly in the big toes, and he had had occasional attacks of lumbago.

Stereo-skiagrams of the joint were taken by Dr. W. Hope Fowler, of Edinburgh. They showed marked lipping of the articular surface of the femur, together with a certain amount of lipping of the acetabulum. The normal concavity of the upper edge of the neck of the femur was replaced by a convexity. There was some blurring of the cartilage interval, but it was still present, so that disorganisation of the joint had not proceeded far. Dr. Davidson considered, and I agreed with him, that the skiagrams indicated a state of affairs which would be greatly improved by cheilotomy. This impression was confirmed by an examination of the patient. Flexion of the hip was possible to a right angle, while abduction and rotation were exceedingly limited, though not absolutely absent. There was slight wasting of the thigh to the extent of about one inch in circumference. An examination of the patient showed him to be in sound general health. He was, however, rather stout, and this added to the difficulty of the operation.

The patient came to London in August, 1913, for the operation, and on the 27th I operated. The anæsthetic was given by Mr. Herbert Charles, and the operation was a prolonged one owing to the stoutness of the patient and the depth of the wound. The hip was approached by a Kocher's posterior incision, and the capsule being opened the buttresses at the upper posterior and anterior aspects of the head of the femur were removed piece by piece. The capsule was sewn up with stout silk. The patient made a good convalescence, although the wound continued to ooze serum for about a week. Passive movements were begun after the first few days.

On Sept. 20th the patient left the nursing home, walking with the aid of a stick. His limping was much less than before the operation, and he could comfortably stride a capsized chair as wide as a horse's back, and could lie all night on the affected hip without being waked by pain—a fact which struck him particularly. There was free rotation of the joint. Abduction was fair but limited by some remaining muscular spasm. A week after his return home Dr. Davidson wrote to me that the patient had stood the journey well and that he was steadily improving. His letter goes on: "He has quite a big range of movement now and can abduct almost to the normal extent. He walks quite well and any limp that appears is more due to habit than anything else. His pain has disappeared entirely, and his spirits have risen in consequence. To-day for the first time in three years he got on horseback and rode round his farmyard without difficulty. His nurse and I are giving him daily movement and will continue to do so for some time yet. On the whole, you are to be congratulated on making a big success of this case."

In November the patient went to Harrogate for some massage and exercise and to take the water to keep down his weight, which since the operation had been increasing rather inconveniently. Dr. Crawford Watson wrote to me at this time: "I must congratulate you upon the result of the operation. He has much more movement and I should think he would be able to ride. He has been on a horse cantering and walking, but has not tried trotting yet."

On several occasions since his operation the patient has written to me. On Dec. 27th last year he says: "I can now walk fully a mile with the help of a stick, but when I try without I can proceed very slowly and only for a short distance, but I think I am gradually going in the right direction, if slowly. My health is good and I have put on 2 st. 2 lb. since I left the nursing home, which is worse for the leg to carry." I wrote to inquire about his riding, and he replied that by using a riding block which reached up to within a foot of the stirrup iron he could get on and off the horse without assistance and without difficulty, that he had no trouble in riding at a walking pace, and that he intended to try the trot in a short time. He still felt matters improving.

The patient reported himself to me on March 10th of this year in excellent general health. With increasing activity his weight has come down to its normal level. He is now living an ordinary life, and can stand about all day without being conscious of any pain or weakness in his hip. By my advice he has not attempted to walk long distances, but he can walk a mile at a fair pace without any discomfort either at the time or subsequently. A slight limp is still perceptible in his gait, which, however, is now active and strong. Since the operation he has had no pain whatever in the hip, a point on which he joyfully insisted. He is now able not only to mount and dismount a horse, but to trot and canter. In trotting, however, he finds some difficulty in rising in the stirrups, and has to help himself up with a hand on the front of the saddle. Cantering he finds quite easy.

On examination I found slight muscular wasting still persistent, the right thigh measuring an inch less round than the left one, and the right calf half an inch less. Abduction was perfectly free to the full extent; it appeared, in fact, actually rather more free on the side operated upon than on the other side. Rotation also was free. No muscular spasm existed. Flexion was free up to a right angle, as before the operation. This is now the only movement of the joint in which he is conscious of any abnormal restriction. His only present complaint is of slight pain in the adductors after any unusual exertion. This probably depends on slight shortening of these muscles during the period when abduction was in abeyance. He expressed himself as fully satisfied with the result of the operation, which has restored to him a life of full activity.

A COMMON MODE OF DEFERRED DEATH AFTER TRACHEOTOMY FOR LARYNGEAL DIPHTHERIA: THE RELATED TREATMENT.

By JOHN BIERNACKI, M.D. GLASG.,
PHYSICIAN-SUPERINTENDENT, PLAISTOW HOSPITAL.

AFTER temporarily successful tracheotomy there may be a return of obstruction due to loose membrane in the trachea—an issue not necessarily dangerous and in any case outside the scope of this paper. Again, a further growth of membrane in the main air passages below the tracheal incision may be responsible for secondary obstruction of a serious kind, but antitoxin treatment has materially altered the course of laryngeal diphtheria in this respect. Under present conditions it nearly always happens in cases of deferred death that severe lobular pneumonia develops. Death is usually attributed to the pneumonia, but this view requires qualification.

In most cases of the kind, if allowed to run their ordinary course, it is more directly the outcome of suffocation by a plug of desiccated mucus and inflammatory discharge located in the neighbourhood of the tracheal bifurcation, as is proved by the immediate relief of obstruction and marked general improvement which frequently ensue when the plug is removed with forceps after such cases have become serious or are even moribund. A plug that forms early may be partly composed of loose membrane, but often none is present. In order to reach the plug a sand-bag or rolled-up towel, sufficient in size, is placed under the patient's shoulders to throw back the head and extend the neck. Inserted closed, the points of the forceps are opened as the bifurcation of the trachea is approached; they are then advanced a little farther, closed again, and withdrawn. As a makeshift, sinus forceps will serve, the points being bent on the flat to a wide angle two-thirds of an inch from the end. However, this instrument is hardly safe, as the sharp points may excoriate the tracheal mucous membrane, and it is sometimes difficult to obtain an effective hold on the plug with them. At Plaistow Hospital the forceps used are broad and bulbous at the point. With either instrument it is easy to search the whole trachea downwards, and even the entrances of the bronchi, given that the head and neck are in proper position. Only a small portion of the plug may be brought away at a first attempt; it may have to be removed piecemeal until what remains is coughed up towards the tracheal incision and can be extracted. Unfortunately the obstruction nearly always recurs; at first the interval may be as long as 12 hours, but it tends to become shorter until extraction gives less relief and then none. Failure to relieve may depend on plugging of the two main bronchi, other factors being the extension of the pulmonary affection with widespread occlusion of the bronchioles.

Many illustrative cases could be cited, but the two following will suffice.

CASE 1.—The patient, a male aged 2 years, was admitted to Plaistow Hospital on March 16th with laryngeal diphtheria and urgent obstruction. Tracheotomy relieved the latter completely, and a comfortable night resulted. Then the discharge from the tube became scanty and the child increasingly restless, with some recession. Towards evening his condition was considered sufficiently grave to justify the use of forceps, and a mass of mucus mixed with membrane was extracted. The obstruction and distress largely subsided. An alkaline spray was prescribed. About midnight the patient expelled a large piece of membrane through the tube. In the morning his condition was evidently worse. He was restless and had some cyanosis and a poor pulse. Ground continued to be lost, and at 2 P.M. a plug of desiccated and inflammatory discharge about two-thirds of an inch in length was withdrawn bodily from the trachea with forceps. Breathing immediately became freer, but the general condition showed less improvement. Throughout the following night and day the restlessness varied in degree. At noon, and again at 6 P.M., plugs were extracted from the trachea. A better night was thereafter passed, although little discharge came away except when the child coughed after spraying. The tracheotomy tube was taken out at 11.30 A.M., and was not replaced despite some restlessness and slight recession. The discharge was becoming looser and more of it was coughed up. Having disappeared for a time the recession returned in the ensuing night, and next day a rubber tube with a dorsal opening was inserted. Four days later the tube was dispensed with. It had to be used again after two days and through the following three nights, from which time the patient made a rapid recovery.

CASE 2.—The patient, a boy aged 3 years, was admitted to Plaistow Hospital on June 17th with marked dyspnœa and recession due to diphtherial croup. The case was of the rather rare septic type. Tracheotomy did not completely relieve the obstruction. Very little discharge was expelled, and a restless night followed. At 11 P.M. a plug of the usual kind was extracted and some relief obtained. Spraying was begun. Next day the child was more comfortable and coughed up a fair amount of thick discharge. By midnight, however, distress had become marked again. On the extraction of a plug there was a change for the better, maintained on the whole through the following day, except that the discharge was offensive—an ominous sign. In the evening cyanosis, modified by pallor, became definite. At 11 P.M. recession was increasing and some thick muco-purulent discharge was extracted. Forceps had to be used again for severe obstruction after a very restless night and day. The relief was less. Oxygen inhalation was begun, but the patient did not react satisfactorily. It was plain that the heart was failing. At 1 A.M. extraction was attempted without success, as only a little discharge was brought away. The child died next day at noon.

Recovery is exceptional once obstruction develops to a degree which makes extraction vital. Nevertheless, life is occasionally saved by clearing out the trachea. Further, the fact that asphyxia largely due to the plug is likely to anticipate death from the pneumonia *per se* must give weight to measures directed against its formation. These considerations indicate a line of treatment which has been well tested at Plaistow Hospital.

1. While dry cases—those generally in which lobular pneumonia is established at the time of operation—are far more liable to tracheal plugging, the latter may take place although the patient's condition is at the outset quite satisfactory. For this reason I feel that the present system of treating straightforward cases without steam cannot be upheld. In my opinion it is safer to place every tracheotomy case in steam for at least a week if the tube is required for that time. Short of this, steam will, of course, be employed at the first sign of dryness. It hinders desiccation of the discharge and is beneficial when lobular pneumonia threatens or is established.

2. If obstruction returns after an interval and is not due to loose membrane, and at the same time the patient is not coughing up discharge freely or the discharge is very tenacious, a spray of sodium bicarbonate is prescribed (10 gr. to the ounce of water). The efficacy of this treatment depends partly on the expertness of the nurse. Using a rather coarse, intermittent spray, she

compresses the ball, say, three times with the nozzle *directed into the mouth of the tracheotomy* tube. This she does during successive inspirations. The patient will probably then begin to cough, and the spraying fluid mixed with more or less discharge may be driven up to the inner end of the tube or out of it. To sop up the fluid and discharge, the nurse makes a thin swab by wrapping cotton wool round the point of sinus forceps bent to the angle of the tube. New swabs are inserted until one comes away dry. Then she repeats the whole process, perhaps three or four times. Not *uncommonly the patient in the end coughs up a* quantity of partly desiccated discharge, so that the formation of a plug may be delayed or possibly averted. If definite plugging occurs the sodium bicarbonate is increased to 20 gr. to the ounce.

3. Extraction should be postponed until it is certain that spraying alone will *not dissipate* the plug and the obstruction has become immediately dangerous. *Great care is needful in inserting the* forceps; if they are opened too soon or too wide or force is used the wall of the trachea may be injured. Streaking of the discharge *by blood* not referable to the operation wound may reveal such injury, the result of which may be that obstruction returns earlier and proves less amenable to treatment. The forceps should be inserted no farther than is necessary to grip the plug. Extraction is discontinued in improving cases whenever this can be done without undue danger of suffocation. Some risk may have *to be run. Throughout the spray* may be serviceable.

4. Oxygen when used is always passed through water. *Straight from the cylinder it rapidly absorbs moisture and thus dries up* discharge.

Wimpole-street, W.

ARTIFICIAL PNEUMOTHORAX:

FUNDAMENTAL DEFECTS IN THE ACCEPTED TECHNIQUE OF INDUCING PNEUMOTHORAX, AND HOW TO REMEDY THEM.

By W. PARRY MORGAN, M.A., M.B. Cantab., B.Sc. Lond.,
ASSISTANT IN THE DEPARTMENT FOR THERAPEUTIC INOCULATION, ST. MARY'S HOSPITAL.

Treatment by means of artificial pneumothorax is still comparatively rarely applied even in suitable cases of unilateral phthisis. An obvious reason for this is to *be found in the difficulties and dangers* incident to the accepted method of operating. The difficulties will be appreciated when we remember that the operator is required to carry down his needle to a point at which it will separate the parietal and visceral pleuræ which *are in apposition* at an unknown depth, and also to verify that it has reached its proper position between these before gas is allowed to flow in. The dangers which have to be taken into account are the possibility of injuring the lung, and the risk of allowing gas to pass into places other than the pleural cavity. It has not been thought necessary to take any *great precautions* to prevent the puncturing of the lung, but on the other hand measures are regularly taken to verify the proper position of the needle, it being laid down that the gas shall not be allowed to flow until it has been *inferred, from the estimation of the intrapleural* pressure and its variations, that the needle is in the pleural cavity. *Thus it is recognised that it is,* at any rate for the purpose of ensuring that the gas *shall not* pass anywhere except into the pleural cavity, absolutely necessary *to record the intrapleural* pressure and its variations. And in point of fact the problem of inducing pneumothorax with safety practically resolves itself into the problem of devising the most suitable way of arriving at the *pressure at the point* where the eye of the needle rests.

I propose in this paper to discuss two ways in which this can be done. The first is the *one* in general use. In it the intrapleural pressure is given directly by the reading of a manometer connected through a T-piece with the tube which carries gas from the reservoir to the needle. This may be called the *direct method*. The second is brought forward here for the first time, and is designed to remedy the defects of the direct method. In it a *resistance in the form of an adjustable throttle* is introduced into the tube which connects the reservoir and the needle, and the intrapleural pressure is then obtained indirectly from the readings of two manometers inserted into the *connecting tube on either side of the throttle*. This may be called the indirect method.

I will deal first with the direct method, and show that it is seriously defective in that it will not furnish records of the intrapleural pressures until the lung has been punctured *and* gas leaks into the pleural cavity.

We may begin with a discussion of the mechanics *of the manometer* as applied to the recording of the intrapleural pressure. It will be recollected that in the ordinary procedure, as a *preliminary*, the reservoir is shut off from the manometer by means of a clamp before the needle is inserted into the chest wall. The manometer will then record atmospheric pressure, and will continue to do so as the needle is passing through the tissues, but as soon as the orifice enters the pleural cavity the gas will, on account of the negative intrapleural pressure, be aspirated *into* the pleural cavity from the connecting tube, and in consequence water will be sucked from the open into the closed *limb of the manometer*. The resulting difference in the levels of the fluid in the manometer will then indicate the negative pressure. It is now presumed that, if at this point the needle is in proper position in the cavity, movements *corresponding to the* respiratory movements will be communicated to the manometer by the gas passing in and out through the *needle*. If these movements do not appear in the manometer the needle is usually pushed *forward* and *drawn* back until they do. But *consideration* will show that movements of respiration cannot be communicated to the manometer unless there is gas in the pleural cavity which can be driven back through the needle, and so the *question* presents itself whether the amount of gas *which* has been aspirated from the connecting tube and manometer into the pleural cavity will suffice, and whether *it* will be available for this purpose.

In connexion with the former issue we will recognise that, *inasmuch* as the intrapleural pressure never differs much from the atmospheric pressure, and since in consequence any gas drawn *into the cavity* will not be appreciably rarefied, the volume of gas which will have passed *from the* connecting tube *into the* pleural cavity will be practically equal to that of the fluid which will have passed from the *open to the closed* limb of the manometer. This volume would, when the negative pressure stands at 15 cm. of fluid in a manometer tube of 0·3 cm. bore, measure less than 1 c.c.

Again, when we ask ourselves whether the gas which has been drawn in will always find a free passage back through the needle, we see that if the quantity of gas in the pleural cavity is insufficient to keep the lung off the needle—and for this purpose 1 c.c. will be quite insufficient—the visceral pleura will, as soon as the intrapleural pressure rises during expiration above that in the manometer, be flapped back upon the eye of the needle, and gas will then be prevented from returning to the manometer. Any subsequent rise in the intrapleural pressure will not be recorded, and the level of the fluid in the manometer will therefore remain the same until, with the return of inspiration, the intrapleural pressure again falls below that recorded by the manometer and the valve opens again.

Now I have shown in a previous paper[1] that gas in the pleural cavity tends to take up a position opposite the consolidated portions of the lung, and so in general the gas aspirated from the manometer will move away from the needle and the valve close earlier with each successive expiration, until after a few respirations it will remain closed during the whole of the expiratory period. The pressure[2] then recorded will correspond to the lowest which is reached during inspiration; in effect the manometer will become a minimum pressure manometer.

This, then, is the train of events which will necessarily follow an attempt to induce pneumothorax for the first time, unless the operator by his manipulations brings about other conditions which prevent valve action and allow respiratory movements to be communicated to the manometer. In other words, the valve action of the lung will prevent the recording of the intrapleural pressures, unless the operator introduces into the pleural cavity more gas than that which is aspirated from the apparatus. There is only one source from which the necessary additional gas can come. It must obviously be drawn in from the alveoli through punctures made into the lung.

This is confirmed by the fact that I had distinct evidence of the establishment of "spontaneous" pneumothorax in a case where I had abandoned the attempt to induce "artificial" pneumothorax and had withdrawn my needle without allowing any gas to pass in from the reservoir. Again a radiograph of the chest taken after a first operation usually shows evidence of more gas in the pleural cavity than has been introduced from the reservoir. While it is a common experience of those using the direct method, that gas can be detected in the pleural cavity by radiography after 200 or 300 c.c. have been introduced, it is our experience since we have adopted the indirect method, a method which, as will be shown below, makes it possible to take records of the intrapleural pressures without first puncturing the lung, that it is rarely possible to detect gas in the pleural cavity until considerably more than 300 or 400 c.c. have been introduced. In point of fact after the change of method was adopted in this hospital, Dr. G. H. Orton, to whom I am indebted for all my X-ray records, found it difficult to believe that such large quantities as 300 or 400 c.c. had been introduced in these cases until he had seen the method in operation.

When we ask ourselves in this connexion under what conditions gas in the pleural cavity would be demonstrable by radiography, we see that its detection would be dependent on the fulfilment of the following conditions: (1) There would have to be established between the lung and the chest-wall a considerable gap through which rays would pass without meeting any obstacle; and (2) the margin of the lung would have to be dense enough to cast a well-defined shadow on the screen. Here attention may be called to the fact that when the lung is still almost normally dilated the shadow cast by its margin is more or less indefinite, but when, as with a large pneumothorax, it becomes retracted, or when it is consolidated, many more rays are interrupted by it, and thus the margin thrown on the screen becomes better defined. Now inasmuch as the gas in a pneumothorax will, unless it becomes localised, tend to spread out as a thin layer, it is unlikely that the introduction of 400 c.c. will cause the development of a sufficiently wide gap, and also unlikely that it will at the same time cause enough retraction of the lung to show up the margin clearly in profile. And, further, it must be remembered in this connexion that where the rays have to pass through one and the same amount of lung substance and one and the same amount of gas it makes no difference to the picture whether that gas is outside or enclosed in the lung.

Thus it would seem that radiographic evidence of gas in the chest could hardly be obtained after the introduction of so small a quantity of gas as 200 or 300 c.c., and we have justification for the conclusion that radiographic demonstration of a pneumothorax after the introduction of such a quantity of gas is achieved only by this being largely supplemented by leakage from the lung.

I will now pass on to the consideration of the indirect method. This method enables us to obtain a record of the respiratory movements and of the intrapleural pressures by the aid of gas supplied from the reservoir instead of from the punctured lung; also to obtain an uninterrupted record because the continuous flow of gas from the reservoir prevents any valve action.

The essential features of the apparatus by means of which this can be achieved will be understood from the following description. The gas in its passage from the reservoir to the pleural cavity encounters two resistances, the adjustable throttle and the needle. Before gas passes through the throttle its pressure (see Fig. 1, P_1) is recorded by the manometer next to the reservoir, and this will be the reservoir pressure; then again, after the gas has passed through the throttle, and before it reaches the needle, its pressure, which has now fallen, is again recorded, this time by the manometer next to the needle. It will be appreciated that so long as this "intermediate" pressure is maintained above the intrapleural pressure, gas flows into the pleural cavity, and the valve action cannot be called into play. Also that when the respiratory movements are taking place, corresponding oscillations will be produced in the manometer next to the needle, but not in the other, because this will continue to register the reservoir pressure. Moreover, from the relation between the reservoir pressure and the mean intermediate pressure given by the "reservoir" and "intermediate" manometers respectively, we can, as I shall show, readily estimate the mean intrapleural pressure, provided always we have at the outset adjusted the throttle

---

[1] THE LANCET, July 5th, 1913, p. 18. On the Possibility of Achieving by Partial Pneumothorax the Advantages of Complete Pneumothorax.

[2] This pressure is usually much lower than the lower limit recorded when the oscillations are not interfered with by the valve action. The reason for this will be understood when we remember that the negative pressure is due, not only to the elastic tension of the lung, but also to such passive resistances as are called into play only when the inspiratory muscles are acting. The existence of these passive resistances will be best appreciated when we recall to mind conditions in which they are considerably increased. For example, very considerable resistance to inspiration is developed when the lung becomes less expansile, as in the case of congestion or consolidation, or, again, when in connexion with an extensive pneumothorax the expansile lung resists expansion on account of the alveolar walls becoming sealed up. Now such passive resistances called into play at the outset of the movement fall off toward the end when the muscular effort ceases, and then the negative pressure becomes wholly due to the elastic tension. It is therefore explicable that the intrapleural pressure should be lowest when this passive resistance is great; that is, before the end of inspiration and before the manometer which necessarily lags has time to record it. On the other hand, when the valve action makes it impossible for the manometer pressure to rise, the absolute minimum pressure only will ultimately be recorded.

so that its resistance bears a known ratio to that of the needle. (Hereafter the mean of the intermediate pressure, which is a fluctuating pressure, will be spoken of as the "intermediate pressure" (P_2). Likewise the mean of the intrapleural pressure as the "intrapleural pressure" (P_3), and the mean readings of the manometers as "the readings.")

The relation which subsists between P_1, P_2, and P_3, will depend on the fact that the ratio of the pressure which is driving gas through the throttle to that which is driving gas through the needle is equal to the ratio of the resistance of the throttle to that of the needle (the resistance ratio, r). Now the pressure which is driving gas through the throttle is the difference between the pressures above and below—that is, the difference between the reservoir and the intermediate pressures (P_1–P_2). Likewise, the pressure which is driving gas through the needle is the difference between the intermediate and the intrapleural pressures (P_2–P_3). Hence the ratio of the differences $\frac{(P_1-P_2)}{(P_2-P_3)}$ is equal to the resistance ratio (r)—i.e.:—

$$r = \frac{P_1-P_2}{P_2-P_3} \quad \dots\dots\dots\dots \quad \text{(i.)}$$

$$\text{and} \quad P_2-P_3 = \frac{P_1-P_2}{r} \quad \dots\dots\dots\dots \quad \text{(ii.)}$$

—i.e., the difference between the intermediate and intrapleural pressures ($P_2 - P_3$) is obtained by dividing the difference between the reservoir and the intermediate pressures ($P_1 - P_2$) by the resistance ratio. From this it will be seen that the intrapleural pressure is given by the formula—

$$P_3 = P_2 - \frac{P_1-P_2}{r} \quad \dots\dots\dots\dots \quad \text{(iii.)}$$

—i.e., the intrapleural pressure is obtained by subtracting from the intermediate the difference between the reservoir and the intermediate pressures divided by the resistance ratio. Again, it will be seen that if the needle opens into the atmosphere the pressure P_3 is zero, and from formula i. we have—

$$r = \frac{P_1-P_2}{P_2}$$

$$\text{or} \quad r = \frac{P_1}{P_2} - 1 \quad \dots\dots\dots\dots \quad \text{(iv.)}$$

—i.e., the resistance ratio can be calculated when the needle is in the air by dividing the reservoir reading by the intermediate and subtracting unity. If the needle is in the pleural cavity and we do not know the resistance ratio, we may obtain it from readings given for two positions of the water bottle (*vide infra*). Thus, if P'_1 and P'_2 are second readings of the manometers—

$$P_3 = P_2 - \frac{P_1-P_2}{r} = P'_2 - \frac{P'_1-P'_2}{r}$$

$$\text{and} \quad P_2 - P'_2 = \frac{1}{r}\left\{(P_1-P_2)-(P'_1-P'_2)\right\}$$

$$= \frac{1}{r}\left\{(P_1-P'_1)-(P_2-P'_2)\right\}$$

$$r = \left\{\frac{P_1-P'_1}{P_2-P'_2}\right\} - 1 \quad \dots\dots\dots\dots \quad \text{(v.)}$$

—i.e., the resistance ratio is obtained by dividing the difference between two reservoir pressures by the difference between corresponding intermediate pressures and subtracting unity.

Having described the essential features of the indirect method, I will point out that, as compared with the direct method, it has also the following very great advantages. (*a*) A mere glance at the manometers tells us at once whether gas is flowing into the chest. Gas is flowing in as long as the intermediate manometer indicates a lower pressure than the reservoir manometer, and it has ceased to flow in when they indicate the same pressure. On the other hand, it will be remembered that in the case of the direct method, before we can be sure that gas is actually passing into the chest we have to note the level of the water in the reservoir, and then to wait, often for a long time, to see whether there is a change in that level. (*b*) It is no longer necessary, as is the case with the direct method, to clamp off the reservoir and suspend operations every time we wish either to verify the position of the needle by obtaining manometric oscillations or to take a reading of the intrapleural pressure. (*c*) We avoid the risk of fluid being sucked back into the needle when the manometer pressure sinks below the intrapleural. Such an accident might easily cause permanent and complete blockage of the needle.

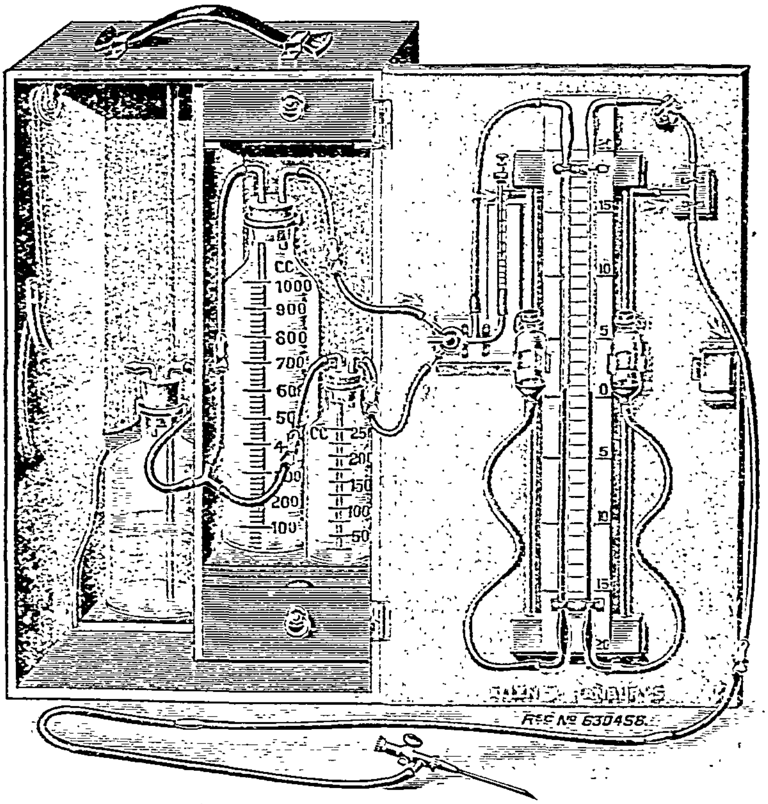
The Apparatus.

I will now describe the apparatus which has been devised by me for the application of the indirect method, and made for me by Messrs. Allen and Hanburys. It will be seen from Fig. 2 that the component parts are contained in a box, and include the following: (1) the water bottle; (2) two graduated glass cylinders which act as reservoirs—the large for nitrogen and the small for oxygen; (3) a three-way tap; (4) the throttle; (5) two manometers; (6) various connecting tubes; and (7) the needle.

We have in the left compartment of the box, standing in a cage whose height can be adjusted by a string passing over a pulley, the water bottle from which water can be siphoned across into either the oxygen or the nitrogen reservoir which stand in the right-hand compartment. According as the three-way tap is adjusted oxygen or nitrogen is driven through the system of tubes and out through the needle. As gas passes onwards from the tap it communicates first by means of a lateral branch of the tube with the left-hand or reservoir manometer; it then passes through the throttle, which is presently to be described. It now passes behind the manometers, and finally, after communicating by a branch with the right-hand or intermediate manometer, courses through a flexible tube provided with a clamp, the "outlet" clamp, and out by the needle.

The manometers are constructed on a U-tube pattern, the fluid used being methylated spirit coloured by an anilin dye. The limb which communicates with the gas stream consists of an upright glass tube of 0·25 cm. bore, provided at its ends with safety bulbs and fixed against a centimetre scale, while the other limb consists of a flexible tube ending in a reservoir which opens to the air and can be moved up and down on a supporting rod. The calibre of the reservoir is made so large compared with that of the upright tube that when fluid passes from one into the other the change of level in the wider is negligible compared with that in the narrower. When for atmospheric pressure the level of the fluid is adjusted to zero on the scale, the working range of pressure is from 20 cm. to −20 cm., but we may record a pressure of 35 cm. by raising, −35 cm. by lowering, the manometer reservoirs. With a view to damping excessive oscillations in the intermediate manometer when an average reading is required, the rubber tube which connects the manometer with the gas stream is provided with a screw clamp. This works upon a pledget of cotton wool, which is placed inside the tube and prevents the communication between the manometer and the gas stream being completely cut off.

FIG. 2.

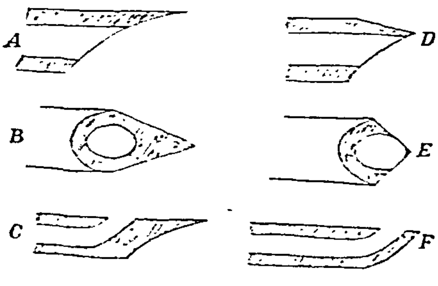


Apparatus for the induction of pneumothorax.

We may now return to the adjustable throttle which is introduced into the path of the gas between the two manometers. This consists of: (1) An outer vertical glass tube about 10 cm. long, with a lateral branch near its upper end; (2) an inner tapering tube of not more than 0·2 cm. bore, fused by the rim of its wider upper end to the inner surface of the outer tube just below the lateral branch; and (3) a plunger in the form of a piston rod of uniform gauge which passes down through an air-tight cover in the upper end of the outer tube into the inner tube. The obstruction which the throttle offers to the flow of gas is determined by the distance to which the plunger is driven down into the inner tube, this being recorded by the aid of a divided scale inscribed on the wall of the outer tube.

The account of the apparatus may be concluded by describing the needle. This differs from the ones in general use in the following respect. While in the ordinary needle (Fig. 3, A and B) the actual point is, by the fact that the dorsal wall is cut across obliquely from within outwards, carried well beyond the orifice, in the one I use (Fig. 3, D and E) the point does not project appreciably above the upper edge of the orifice. This is arranged by grinding the dorsal aspect so as to give, instead of a single ventral facet of the ordinary needle, a trocar whose facets would be the truncated ventral facet and two smaller latero-dorsal facets. If it is thought better to employ a lateral-eyed needle, I would suggest the form shown in Fig. 3, F, instead of the usual form shown in Fig. 3, C.

FIG. 3.



Directions.

First adjust the manometers. To do this turn off the three-way tap so as to shut off communication with the gas reservoirs. Then draw up the plunger of the throttle and open the outlet clamp. Now adjust the manometer reservoirs so that the levels of the fluid in the straight limbs stand at zero on the scale. (Readings above this will represent negative and readings below positive pressures.)

Next we have to fill the reservoirs with gas. To do this first disconnect the reservoirs from the three-way tap, and having filled the water bottle with water, allow this to syphon across so as to fill up the reservoirs. Take the tube which previously connected the large reservoir with the three-way tap and fit it to a nitrogen cylinder. Let gas pass in until all the water is driven back into the bottle. Then re-establish the connexion between the nitrogen reservoir and the three-way tap. Go through the same procedure with the small reservoir, using here oxygen instead of nitrogen. Now replace the air in the rest of the apparatus by oxygen. To do this open the three-way tap to oxygen, raise the water bottle and allow some of the gas to flow through the needle. Then apply the outlet clamp and let gas now bubble through the manometers. Finally, lower the water bottle so that fluid runs back again into the straight limbs.

The throttle has now to be adjusted. For this purpose raise the water bottle until the reservoir manometer reading is about 12 cm. Then adjust the plunger so that the reading of the reservoir manometer is three times that of the intermediate. By reference to formula iv. it will be seen that the ratio of the resistance of the throttle to that of the needle is now 2.

We are now ready to insert the needle into the chest. This is done as follows. First adjust the water bottle so that the reservoir pressure stands between 0 and 1. Oxygen now flows very slowly through the needle. Then perform paracentesis in the same way as is done when the direct method is used. From the moment the needle enters the tissues, the manometers must be unremittingly watched for the indications which the movements in them afford. By means of these we must be able to recognise whether gas is flowing, and if it is to estimate its approximate rate; also, we must be able in the case where there is no flow to find out what prevents it, and in the case where gas is flowing to determine the position of the eye of the needle.

Concerning the flow, it has already been pointed out that there is none when the two manometers indicate the same pressure—that is, when the fluid in both stands at the same level. Again, there is a flow when the level of fluid in the intermediate is higher than that in the reservoir manometer, and the rate of flow is proportional to the difference between these levels. In the case where there is no escape of gas the obstruction may be due to either of two causes: (1) the needle may be embedded in tissue; and (2) the eye of the needle may be blocked. To distinguish between these, shut off the reservoir and forcibly compress the connecting tube so as to drive gas toward the needle. If the needle is patent gas will now be driven into the tissues and consequently a negative pressure, which will be indicated by the manometers, developed in the tube when it is released. If, on the other hand, the eye of the needle is blocked, our manipulations will leave the fluid in the manometers unaffected.

In the case where gas is flowing into the chest we can determine the bearings of the needle only by keeping watch on the mean pressure of gas at the orifice. If the eye of the needle is safely lodged in the pleural cavity, and there is already sufficient gas present to prevent any valve action, we may obtain this pressure by the direct method by closing down the throttle and reading off the intermediate manometer. The mean of the readings will then indicate the mean intrapleural pressure. If, however, there is a possibility of the valve action taking place we must apply the indirect method. The procedure will then depend on whether the needle is quite patent or has become partially obstructed. Such an obstruction will be recognised by raising the water bottle, and noting whether the rise which this produces in the reservoir pressure is as much as three times that produced in the intermediate. If it is as much the needle is quite clear, but if it is less the needle has become obstructed (cf. formula v.).

In the case where the needle is quite clear the pressure at the eye is obtained as follows. Take the reading of the reservoir manometer, then the reading of the intermediate, and from the second reading subtract half the difference between the first and the second (*vide* formula iii.). Thus, if 8 and −2 were the readings, the difference would be 10 and the intrapleural pressure

$$-2-\frac{10}{2}=-2-5=-7.$$

In the case where the needle has become partially blocked it becomes necessary to estimate the altered resistance ratio. This is done as follows. Take the readings of the manometers for two positions of the water bottle. Divide the difference between the reservoir readings by the difference between the intermediate readings and subtract unity (*vide* formula v.). Example:—

	Reservoir pressure.	Intermediate pressure.
First readings	12	3
Second readings	2	−1
Differences	10	4

$$\text{Resistance ratio} \ldots \ldots \quad \frac{10}{4}-1=\frac{6}{4}=\frac{3}{2}.$$

In order now to get the pressure at the eye of the needle proceed as follows. Take the readings of the two manometers and divide their difference by the new resistance ratio obtained above. Now take this result and subtract it from the reading of the intermediate manometer. This gives us the pressure at the eye of the needle (*vide* formula iii.). For example, we may take the readings given above for estimating the resistance ratio. Thus, taking the readings 12 and 3, the difference is 9, and this divided by the resistance ratio is 6. Subtracting this 6 from the reading of the intermediate manometer 3, we have −3 for the required pressure. When we use the other readings 2 and −1 and proceed as before we obtain the equation $-1-\frac{2-(-1)}{3/2}=-3$. This will be seen to be the same result as that obtained from the first readings.

It will be noted that if the needle becomes partially obstructed, and we do not in estimating the pressure take into account the change in the resistance ratio, the rule would give us too high a value for the pressure. Thus in the examples above, where the first readings were 12 and 3 and the others 2 and −1, the estimated pressure, assuming the resistance was still 2, would be in the first case $3-9/2=-1\frac{1}{2}$ instead of −3. In the second case $-1-3/2=-2\frac{1}{2}$ instead of −3.

These examples show that the lower the reservoir pressure the smaller the error, and hence if we ensure this pressure being less than atmospheric pressure, we may when estimating the pressure at the eye of the needle neglect any slight block.

Having obtained records of the mean pressure at the eye of the needle, we may now deduce the position according to the following rules: 1. When the mean pressure remains constant and does not exceed −5 cm., the needle is in the pleural cavity. 2. When the mean pressure stands at the outset at −5 cm., and afterwards rises rapidly, the needle is in a pocket bound down by adhesions. 3. When the mean pressure is approximately equal to atmospheric pressure, the needle is in the lung. 4. When the values of the pressure do not conform to any of the above types, the needle is probably misplaced. In these circumstances the gas must be immediately cut off.

When we have inferred from the estimations of the pressure at the eye of the needle and the oscillations in the intermediate manometer that the needle is safely lodged in the pleural cavity, and that in consequence we need no longer fear accidents from the introduction of nitrogen gas, turn on this gas and allow it to flow. As the level of the water in the reservoir rises, raise the water bottle so as to maintain the reservoir pressure. All the time that the gas is flowing, the manometers must be carefully watched so that any irregularities shall be at once noticed. The question of how much gas shall be introduced is of course a matter for the discretion of the operator, but in cases in which it is desired only to maintain a partial pneumothorax I would suggest leaving off while the intrapleural pressure is still negative.

These instructions will have to be modified in the case where gas is introduced into the pleural cavity to replace a pleural effusion. In these circumstances it is necessary to connect the needle with an aspirating apparatus, and this is effected by means of a socket on the needle holder. The needle one would employ should be considerably larger than that used for the operation just described, and its resistance correspondingly less. On the other hand, the throttle resistance should be about the same. In such a case the resistance ratio would be so great that the intermediate pressure would be practically the same as the intrapleural. Before performing paracentesis connect up the apparatus with the aspirating pump and apply the outlet clamp. Then raise the reservoir pressure above any likely intrapleural pressure. This will prevent fluid passing into the connecting tube. Now introduce the needle into the pleural cavity and aspirate some fluid. This done, shut off the aspirator and release the outlet clamp. Gas will then commence to flow and the intrapleural pressure can be estimated. Now regulate the reservoir pressure so that it is not more than 5 cm. above the intermediate. By alternately aspirating fluid and allowing gas to flow, we may ultimately leave the pleural cavity containing a known quantity of gas at a suitable negative pressure without subjecting the lung to the rapid distension which would occur with aspiration only.

Before concluding this paper I will describe what has been common and striking experience in using this apparatus, experience which seems to me to put beyond question the points which have been already emphasised in connexion with the recording of the intrapleural pressures by the direct method.

I have frequently passed the needle into the chest, have satisfied myself by estimations of the intrapleural pressure and its variations that the eye of the needle was safely lodged in the pleural cavity, have passed quantities of gas varying from a few c.c. to over 100 c.c., and have then found, on cutting off the supply of gas from the reservoir and so applying the direct method, that the respiratory oscillations gradually became smaller and smaller and finally stopped, the pressure recorded by the manometer sinking to a minimum. In some of these cases, on the patient taking a deeper breath than usual, the recorded pressure has fallen still lower. Again, when the gas has been once more turned on, it has been the rule for the oscillations to recommence, but in some cases in which they have failed to appear I have afterwards found the needle blocked.

Although the conclusions to be drawn from these observations have been already embodied in the earlier part of this paper they are so important that I will restate them. They are as follows: 1. Gas introduced into the pleural cavity will often move away from the needle. 2. If it moves away and gas does not flow in from the reservoir, the valve action of the lung comes into play, cutting off the manometer from the pleural cavity. 3. If the direct method comes into application in such cases oscillations of the manometer are obtained by the aid of gas which continuously leaks out from punctures made into the lung.

Clinical Notes:

MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL.

◆

A NOTE ON A CASE OF RATTLESNAKE BITE.

By W. ESSEX WYNTER, M.D. LOND., F.R.C.P. LOND.,
PHYSICIAN TO, AND LECTURER ON MEDICINE AT, MIDDLESEX HOSPITAL, LONDON, W.

BITES of snakes, other than adders, are so rare in this country that the following instance is of interest.

On June 26th, at noon, a keeper, aged 20, at the Zoological Society's Gardens, while transferring a rattlesnake just arrived from Texas from its travelling box to a cage, incautiously inserted his fingers to displace the glass front. In an instant the snake struck at his hand, inflicting superficial wounds on the first and second fingers immediately below the nail, drawing blood. The curator at once tied ligatures round the two fingers and a handkerchief about the upper part of the forearm, and then made incisions across the dorsum of the fingers on the proximal side of the wounds. The patient was placed on a mattress and kept quiet all day. He felt faint and weak but thought he might have been able to walk if necessary. Solid potassium permanganate was applied to the bites and incised wounds within a few minutes. At about 7 P.M. a general stiffening of the limbs occurred, with swelling in the throat, causing difficulty in swallowing and some dyspnœa. During the night vision became dimmed. The bowels and bladder were relieved. Prostration was more marked, and attempts were made to rouse the patient. Pain occurred in the back and on movement of the limbs. There was very little sleep, but no headache or vomiting.

On the morning of the following day the patient felt better, but experienced double vision and the arm was painful, aching up to the shoulder. Both arms were flexed across the body, and attempts to extend them caused pain. There was some rigidity of the neck.

On admission to the Middlesex Hospital about midday the man seemed languid and lay on his back with the eyes half open. His face was white and perspiring, and there were some swelling and drooping of the eyelids. Pulse, 120; respiration, 28; temperature, 98° F. The right arm was swollen, red, and painful; there was some sloughing about the cuts on the fingers which were blackened by the permanganate, and a gland could be detected in the

—congenital coarctation of the aorta, obesity, and various diseases of the skin. Room has also been found for a notice of Ohm's interesting attempt to obtain graphic records of the heart sounds and pulse tracings simultaneously, which was described at the International Congress of Medicine held in London last year.

To praise this text-book seems almost needless; since its first edition came out nearly 25 years ago it has been the familiar friend of many successive generations of medical students, and its several editions have always presented its readers with a sound and trustworthy account of the medical practice of the day. The commoner diseases receive the fullest consideration, while the rarities of medicine are given brief but adequate notices. In this way Dr. Taylor's volume continues to afford a very happy contrast to the many medical text-books that appear to have been written for what may be called examination purposes, and give more space to a rarity like syringomyelia than to a commonplace of medical practice such as rickets.

A few errors that have crept into the text may be noted in order that they may be removed in the issues inevitably to follow: the name "Médin" on p. 135 should be Medin; the description of the electrocardiograph (p. 607) is erroneous in some particulars; the hybrid term "polyglandular" on p. 923 should surely be replaced by "pluriglandular"; and "goître" might well be now spelt "goitre" throughout, in accordance with modern usage.

The Surgery of the Stomach: A Handbook of Diagnosis and Treatment.

By HERBERT J. PATERSON, M.A., M.C., M.B. Cantab., F.R.C.S. Eng. New and revised edition, with plates. London: James Nisbet and Co., Limited. 1914. Pp. 342. Price 15*s.* net.

Mr. Paterson has written so well on the surgery of the stomach that we are not surprised that a new edition of his work has been called for only a short time after the appearance of the previous issue. The time that has elapsed has not been sufficiently long to make any startling change in the surgery of the stomach, but the author has been enabled to make many alterations in his book, If most of them are not of great importance, this is a proof of original foresight on his part, and it is worth while to notice some of them.

In the earlier edition the operation of gastro-jejunostomy was illustrated with a number of photographs; in the present edition the photographs have been reproduced in pairs for use stereoscopically, and when the stereoscope is employed the details are much more clearly visible. A further change has been the introduction of a number of plates illustrating the value of radiographs in the diagnosis of abdominal lesions. The plates have been made from radiographs prepared by Dr. A. C. Jordan, who has had a very large experience of X ray work of the abdomen.

Mr. Paterson is known to hold the opinion that except in cases of real pyloric obstruction the benefit of the operation of gastro-jejunostomy is due to physiological changes, rather than to the mere formation of a direct passage from the stomach to the jejunum. Some further investigations which he has made have been embodied in the chapter on the physiological effects of the operation. Most surgeons believe that the operation is purely mechanical, but it is not easy on this theory to account for the benefit of the operation in cases where there is no pyloric stenosis, for we know from the evidence provided by radiography that in many cases the food continues to leave the stomach by the pylorus even when the operation has conferred great benefit on the patient. Mr. Paterson holds that the presence of bile in the stomach after the operation is almost if not quite the rule, for he has found that in 99 per cent. of the cases there is an increase of the mineral chlorides in the gastric contents, and he believes that this is due to the mineral chlorides of the bile and pancreatic juice, which gain access to the stomach after the operation. In those rare cases in which gastro-jejunostomy has been "undone" he has noted a decrease in the amount of mineral chlorides. These contentions are supported by a series of analyses and there is certainly much to be said for the view. A further striking effect of the operation is a marked diminution of the total acidity of the gastric juice; this the author ascribes partly to the neutralising effect of the bile and pancreatic juice, but partly to a diminution in the amount of gastric juice secreted.

The book is the product of a careful and experienced surgeon and an original thinker, and this new edition will more than maintain the place in surgical literature which was gained by the first edition.

Local Anæsthesia.

By Dr. ARTHUR SCHLESINGER (Berlin). Translated by F. S. ARNOLD, M.B. Oxon. Illustrated. London: William Heinemann (Rebman, Limited). 1914. Pp. 209. Price 5*s.* net.

THIS well-printed, nicely bound little book contains the best exposition of the action of local anæsthetics that we have read. The fact of its being a translation is only evidenced here and there, mainly by the use of expressions such as a "parulis," not commonly employed in ordinary English text-books.

We are interested to see that Dr. Schlesinger does not hold with the belief that cocaine is always harmless when merely painted on mucous surfaces. There is an excellent discussion of Schleich's infiltration method, and the author shows good reason for dissenting from Schleich's explanation of the way in which his process of obtaining analgesia actually attains its object. Dr. Schlesinger is fully alive to the limitations of local anæsthetics. Discussing the use of local methods in head cases he says with much good sense: "It is, however, not everyone who can bring himself to let his skull be chiselled open while he is fully conscious. One of my patients told me that, though he suffered no pain, the sensations of hammering and boring were so horrible that he would much prefer to be put under chloroform." Similarly for almost all abdominal operations Dr. Schlesinger pronounces against local methods. He is opposed, moreover, although he does not advance his reasons, to the "combined anæsthesia" of local and general agents; so presumably Crile's "anoci-association" would not receive his support, although he does not specifically mention this system. For minor surgery generally Dr. Schlesinger recommends conduction anæsthesia by means of novocaine in 1 or 2 per cent. solution, to which he adds suprarenin solution to the extent of 1 to 4 drops of a 1 in 1000 solution to each 10 c.c. of novocaine solution. There is a curious misprint of infra for supra orbital when anæsthesia of the upper jaw and face is under discussion. Dr. Schlesinger states that inflammatory processes heighten insensibility, particularly of the parietal peritoneum. We wonder whether this is borne out by the general experience of other observers.

We can strongly recommend this book as a guide to the practice of local analgesia.

The Early Diagnosis of Tubercle.

By CLIVE RIVIERE, M.D. Lond., F.R.C.P. Lond., Physician to Out-patients, City of London Hospital for Diseases of the Chest, Victoria Park; Physician, East London Hospital for Children. London: Henry Frowde. 1914. Pp. 260. Price 6*s*.

TOO much stress cannot be laid on the importance of the early diagnosis of tubercle, but in order to arrive at a correct conclusion the greatest care is needed, and considerable experience is required before the necessary technique can be adequately acquired. To arrive at a diagnosis from one symptom or from one sign only is to court disaster, and in each individual case a careful study of all phenomena presenting themselves is absolutely essential.

In the volume now before us Dr. Clive Riviere gives a good description of the various procedures necessary in examining patients—adults and children—in order to ascertain the presence or absence of tuberculous disease, especially of the pulmonary variety. His object has been to present shortly and clearly the points whereby an accurate technique in the various methods may be acquired. He very rightly lays stress on such aspects of the normal as are likely to suggest or simulate disease, and he points out where pitfalls are likely to arise. In many works on diseases of the chest sufficient emphasis has not been laid on the importance of recognising the physiological variations which may occur in the character of the breath sounds, and unless these be recognised errors in diagnosis may easily arise. Dr. Riviere draws attention to these points, and especially to the altered characters that may be apparent beneath the right clavicle. He discusses the diagnostic use of tuberculin at considerable length. We entirely endorse his views that the subcutaneous test should only be employed by those whose special knowledge of this branch of work fits them duly to avoid the dangers and correctly to interpret the results. The value of the temperature chart is also noted, and the significance of the opsonic index is duly considered.

The book is well written, and forms a good manual on the subject of the early diagnosis of tubercle.

Physiologie Normale et Pathologique des Reins.

Par L. AMBARD, Chef de Laboratoire de Chimie de la Clinique des Voies Urinaires à l'Hôpital Necker. Préface de M. le Prof. F. LEGUEU. Paris: F. Gittler. 1914. Pp. 329. Price 15 francs.

THE author points out that this is not a complete treatise on the physiology and pathology of the kidneys, as the title might lead one to suspect—e.g., intentionally he has left out the consideration of the renal secretion in cardiac and febrile disease, while albuminuria is almost entirely omitted. Somewhat less than one-half of the text is taken up with an account of renal physiology. The author, besides numerous observations on man, records many of his experiments and of those of his collaborators on the dog. He points out that the kidneys are really "concentrating" organs. Substances which are found in very small quantities in the blood are excreted in a highly concentrated form in the urine—e.g., urea. He devotes many pages to what he calls the "concentration maxima," each substance having its own maximum under certain conditions. Very elaborate tables and numerous experiments are given to show this for urea, sodium chloride, water, and glucose. The concentration maximum is a function of the quality of the renal parenchyma. But the kidneys have another function; they regulate the limits of excretion. The technical methods used for estimating urea, glucose, and sodium chloride are given. "Débits," or the quantities of any substance excreted in a given time, are next dealt with, and the relation between the amounts of the several urinary constituents, as well as the elimination of such substances as ethylic and methylic alcohol and glycerine. The nervous system is regarded as affecting urinary secretion in addition to its purely vaso-motor effects.

The latter half of the monograph deals with nephritis. First there is nephritis with œdema, and other forms without œdema. There are also mixed forms, and, what is important for the clinician, there is a very careful exposition of the prognosis in the various forms of nephritis, as well as an admirable résumé of the effects on the organism of defective renal activity. The last chapter, on the exploration of the renal functions in surgery, is thoroughly practical, and includes a description of the chief methods to be used by the surgeon—e.g., the elimination of methylene blue, phloridzin glycosuria, cryoscopy of the blood, and experimental polyuria, as well as the concentration maximum of urea.

We can cordially commend the study of this interesting and practical monograph to clinicians and surgeons alike who have to deal with renal disease. It is an admirable clinical and scientific contribution to the study of urology.

The History of St. George's Hospital.

By G. C. PEACHEY. Parts III. and IV. Price 5*s*. Parts V. and VI. Price 5*s*. London: Bemrose and Sons.

AFTER the issue of the first two of the 12 parts in which this history was projected, the health of the author became so seriously impaired that the remaining parts were postponed for a considerable period. Now they have been resumed; and, indeed, the four which have lately been added to the series have appeared two at a time. Parts I. and II.[1] dealt with the general conditions of medical science and the relief of the sick poor in the London of the early eighteenth century, and with the circumstances which led up to the foundation of St. George's in 1733, following the schism at the Westminster Infirmary (now Westminster Hospital). Parts III. to VI. contain a most minute and valuable account of the first 20 years' working of the institution. These sections are packed with interesting details which illustrate very vividly the life and the practice of medicine of the second quarter of the eighteenth century. They include, also, painstaking biographies of all the members of the medical staff who served during that epoch. The labour represented by these accounts of old-time physicians and surgeons has obviously been very great; Mr. Peachey has spared no pains to gather every detail which might throw light upon their careers and has brought an honourable enthusiasm to an onerous task.

---

[1] See THE LANCET, June 11th, 1910, p. 1624 (Part I.); and Jan. 21st, 1911, p. 173 (Part II.).

The early admission books of the hospital have been lost beyond all hope of recovery; but, fortunately, a practice prevailed during the first two years of the existence of St. George's of entering in the minute books, not only the names of those who recommended patients for admission, but also the names of the latter, the diagnosis of their diseases, and the results of their treatment. Thus an analysis has been rendered possible of the in-patients treated in 1733–1735. They were 1502 in number, and the list includes consumption, 185 cases; rheumatism, 154; ulcers, 128; intermittent fever (possibly malaria from the Chelsea marshes was one of the diseases thus diagnosed), 124. These were the principal groups; lesser ones were dropsy, 59 cases; palsy, 45; nervous disorders, 40; tumours, 35; rupture, 25; fractures, 19; obstructions, 19; ophthalmia, 18; epilepsy, 22. Two other and very interesting items from this list are scurvy, 47 cases; and "leprous," 13 cases. It is impossible to guess whether these last 60 cases would nowadays be diagnosed as they were then; but even if nine-tenths of them fell into other categories, the residue would still indicate a very different prevalence of those two diseases from that which exists at present. Another noticeable feature is the scarcity of all kinds of tonsillitis and sorethroat. This was evidently not due to any refusal to admit infectious cases, since one case of scarlet fever and one case of chicken-pox are among the 1502; but strange to say not a single case of acute faucial angina (with the exception of the scarlet fever case just mentioned) appears to have been admitted to the hospital, unless the 21 unclassified cases of "pain" included some.

In 1749, we learn, the question of burial-ground accommodation led to the purchase by the hospital trustees of a piece of garden land at Brompton for about £500. Here those who died in the hospital were interred, and here also the widow of the gardener grew vegetables which she supplied to the governors for the use of the patients. This burial ground is of interest in that in 1825 it was sold for the erection of Holy Trinity, Brompton, which with its churchyard occupies the whole of the old St. George's burial ground. Many more instances of the curious and antiquarian lore which fills this history could be quoted, but those who are interested in either the state of the medical profession, or of the management of voluntary charities, or of the details of the history of St. George's during the 20 years following 1733, will do well to read Mr. Peachey's pages for themselves.

LIBRARY TABLE.

Tierische Immunität. By Dr. WERNER ROSENTHAL. Braunschweig: Friedr. Vieweg und Sohn. Pp. x.–330. Price 6.50 marks; bound, 7.20 marks. —This book, which forms Band liii. of Die Wissenschaft Series, is intended not for the specialist but for students of medicine and those practitioners who have not made themselves familiar with the comparatively new subject of immunity. It has been written in a popular style, and the author has been careful to distinguish facts from theories and to point out the direct applications of the work on this subject. Though he has not gone deeply into the question of technique the book has been well brought up to date, and we can say that it carries out the original idea of the author in an able manner.

Festschrift des Institut Medical der Al Hayat Kompagnie in Helouan.—This pamphlet of 130 pages was published recently in connexion with the visit of a medical and scientific expedition sent from Berlin to investigate the circumstances of Helouan as a health resort, and particularly to inquire into the alleged benefits to be derived from its desert climate and its thermal springs. Helouan is largely frequented by English, German, and Russian invalids, and a German company, with characteristic business enterprise, has provided hotel accommodation, a sanatorium, and a medical institute for its compatriots. The pamphlet, which is of course in German, comprises five separate articles, two of them being written by Dr. Wilhelm Preminger, chief of the Helouan Medical Institute; the first giving some observations on the results of the treatment of nephritic cases at Helouan, the second dealing with gout in the knee-joint and the effects of treatment by the local sulphur baths. Dr. Max Loewy, a nerve specialist, who apparently divides his time between Marienbad and Helouan, writes on hypnotic suggestion and the limits of hypnotic influence. A short paper with a series of charts or curves is contributed by Dr. Theimert, showing the variations in the amount of albumin, urea, and chlorides excreted by certain patients under treatment in the medical institute, of which he is assistant medical officer. These four papers just mentioned take up 58 pages, but the last paper, written jointly by Dr. Preminger and Dr. Loewy, occupies the remaining 72 pages of the pamphlet, and is entitled "The History and Development of Helouan as a Health Resort." The winter climate of Helouan is dry, warm, and invigorating. The medicinal springs are of three kinds, sulphur, saline, and chalybeate, and can be used internally or externally. The cases which seem to benefit most are those of renal disease, neurasthenia, anæmia, chronic respiratory troubles, gout, and rheumatism. The publication of this last paper seems to have been the main object of the *Festschrift*, which is printed at Cairo by the Société Orientale de Publicité.

Ionic Medication. By LYTTON MAITLAND, M.D. Lond., formerly Assistant in the Electrical Department, Charing Cross Hospital. London: The Scientific Press, Limited. 1914. Pp. 102. Price 1s. net.—This is a small volume on the theory and practice of ionic medication, apparently meant for clinical assistants and those working under the direction of a physician. A good deal of the space is taken up with theoretical considerations, but practical matters are dealt with fully and yet concisely. It contains a large amount of sound information within a small compass, and the little book will be found very useful by those taking up the study and practice of this increasingly important branch of treatment.

Das Freilufthaus: ein neues Bausystem für Krankenanstalten und Wohngebäude. By D. SARASON, H. C. NUSSBAUM, H. BECHER, and N. BARDSWELL. With 6 plates and 32 figures in the text. Munich: J. Lehmann. 1913. Pp. 122. Price, paper, 5 marks; bound, 6 marks.—In 1901 Dr. Sarason devised a system of building sanatoriums and homes for tuberculous patients, with the special object of supplying each floor with an open-air balcony. The main idea, which he claims as a novelty, is that each floor shall be stepped backwards 8 ft. or so on its southern aspect, so as to give each floor a balcony 8 ft. wide; thus the ceiling of the ground floor is 8 ft. wider than that of the first floor, 16 ft. wider than that of the second floor, and so on. He appears to contemplate the erection of sanatoriums five or six storeys in height. Many of his rooms and passages appear to be unduly airless and dark. In one of his wards with 16 beds the washing arrangements consist of three basins and a bath tucked away in one corner. Most of his bathrooms are fitted up as water-closets also; some of his bathrooms and water-closets appear to ventilate into reading-rooms or passages, but to have no outlet to the external air. The book will be of interest to architects and specialists in tuberculosis, but the buildings described hardly appear suitable for erection in this country.

Extraction of Teeth. By F. COLEMAN. Second edition. With 57 illustrations. London: H. K. Lewis. 1914. Pp. 167. Price 3*s.* 6*d.*—The second edition of this book has been largely rewritten, and the author includes some instructive and practical illustrations. The operation of tooth extraction is, we fear, too often undertaken by those possessing practically no knowledge of the parts involved, with the result that although the tooth is removed an undue amount of damage of the hard and soft tissues is caused. In this volume Mr. Coleman deals in an able manner with the whole question, and we strongly recommend the book to those medical practitioners who are from time to time called upon to perform the operation of tooth extraction.

MISCELLANEOUS VOLUMES.

HE is a bold man who attempts to translate "Pierre Loti." The clear, concise, almost rhapsodical French of M. Viaud is very difficult to render into English. So with some success the renderer of *Morocco*, by PIERRE LOTI (translated from the French by W. P. BAINES, with 12 illustrations in colour and tone. London: T. Werner Laurie. Pp. 335. Price 7s. 6d. net), has kept very closely to the French style, frequently only transferring individual words from one language to the other. This volume is a charming account of a French diplomatic mission's journey to Fez in 1889, long before the beginning of that systematic subjugation of Morocco which is being completed to-day. As we might expect, we have afforded us a glowing and vivid picture of a country which was 20 years ago more Oriental than the East. To gauge Morocco from Tangier alone is like gauging Egypt from Port Said or Cairo. If, as Pierre Loti says, the sense of translation into anterior times strikes the visitor to Tangier, far more does it strike those who land in the towns of the Atlantic coast—Salee, Mazagan, Mogador, Arzila—and more still those who penetrate to Fez or Marakesh. The immense antiquity of Morocco must impress itself on the reader, as it has on the author. The southern capital of the country had water supplied in pipes to every house centuries before any European city and when the aqueducts of Rome had been all broken down. There are excellent illustrations to this volume, in no degree too bright in colour. Everyone who can should visit Morocco as soon as possible, for the accessible parts of its large area will probably rapidly be de-orientalised in the next few years.

In the *House on Wheels* (London: Chapman and Hall, Limited. 1914. Pp. 150. Price 2*s.*) Dr. ELIZABETH SLOAN CHESSER writes most entertainingly—e.g., the incident of the paraffin and the pie (p. 52)—and also instructively of her "trek through Kent" in a caravan. It is not until we arrive at Chapter VI. that we begin to realise the *arrière pensée* of the book—for there we learn that "the modern caravanner belongs to one of three types, the holiday maker, the gipsy, or the propagandist"—and though we ought perhaps to have had our suspicions aroused at the outset by the name of the caravan, the "Florence Nightingale," only now do we realise that this caravanning expedition, which we have been so heartily enjoying, was no mere holiday jaunt, but part of the praiseworthy campaign of the Women's Imperial Health Association. From here on we begin to get glimpses of that work in the experiences related. An appendix gives a few hints on caravanning, and directs the reader's attention for further information on that subject to the Caravan Club, whose quarters have been removed since this book was published to 108, Long-acre, W.C.—There is a literary charm in the direct conversational style of *Autolycus in Arcady*, by HERBERT W. TOMPKINS, F.R.Hist.S. (London: George Allen and Co., Limited. 1914. Pp. 248. Price 3*s.* 6*d.* net). His discursive remarks "from the journal of a wandering bookman, set down between Guildford and New Romsey," to quote the title page, on men and things, books and authors, Pepys, Boswell, Montaigne, and Lamb make delightful reading. On a rambling tour a more pleasant partner than Autolycus would be hard to imagine, but, failing that gentleman's personal presence, we must be content with the reminiscences that he has gathered for us on his wanderings, and the book itself will prove an enjoyable companion either in an arcadian shady nook when the days are long or by the fire on winter evenings.

In *The History and Economics of Indian Famines*, by A. LOVEDAY, B.A. (London: G. Bell and Sons, Limited. 1914. Pp. 163. Price 2*s.* 6*d.* net), which is an enlargement of the Le Bas prize essay of last year, with some modifications, the author quotes the records of the earlier famines, deals shortly with the great disaster in Bengal and Orissa in 1770, and the methods of relief adopted by the East India Company, and in more detail describes the organisation and protective measures adopted at the present time. There are few generalisations applicable to the whole of India, but one is that over two-thirds of its population are occupied in an industry "almost wholly dependent upon a sufficient and well-distributed rainfall." Another important point is the poverty of the cultivator—that is, of the majority of the population. The income per head was estimated at £2 per annum in 1880, and it is not thought to have much increased since. The native is nevertheless extravagant, and is consequently to an enormous extent in the hands of the moneylenders. The old custom of hoarding grain to carry the people through a bad year has largely gone out with increased facilities for transport. The Government (by financial decentralisation and by instituting the Famine Insurance Fund of 1877) and private charity (by the Indian Peoples Famine Trust) have done a great deal towards guarding against disaster in the future; but the ultimate solution lies, as Mr. Loveday insists, in individual frugality, and this depends on carrying out the principle of coöperation in agriculture, as in other industrial pursuits.

We have rarely read a more temperate and restrained, and at the same time cogent and forcible, appeal for a wise consideration of the whole subject of the White Slave Traffic and the social aspects of the venereal diseases than *The Social Disease and How to Fight It* (London: Longmans, Green, and Co. 1914. Pp. 87. Price 1*s.* net), by LOUISE CREIGHTON. It is admirably balanced against either extreme. While recognising that the first need is for knowledge, Mrs. Creighton realises that, as everyone cannot know everything at once, selection is requisite, not only between who shall know, but also to decide how much each should know, for "it would be foolish to deny that there are dangers in the indiscriminate distribution of knowledge." Ignorance, she says, has proved so dangerous that it cannot be allowed to go on, but it is well that each should know only just so much as is useful to him. "There is no need to know all the details of disease in order to avoid it; there is no need to dwell upon its horrors, still less to speak about them. ...... All are not called upon to study disease as if they were doctors." The author insists on the need for dethroning the double standard of morality, but she realises that that can be done only by leading men and women to fight and work together to that end. "The mistake of so much that has been said lately on this subject is that it has been treated as if it were a woman's question, a matter in which women had to fight against men to maintain the rights of their sex." In this struggle, as she rightly says, women have not got to fight against men, but to win more men to fight with them. But while there must be a fight and all must take part in it, all are not called to take the same part. In teaching girls about the dangers they may run she points out that care must be taken that the teaching does not arouse panic, the nervous fear that goes out to meet dangers or the hysteria that imagines them. Above all, "those who want to work for purity must be careful about the purity of their own souls." The book ends on a hopeful note. It should be widely read.——A series of admirable lectures on *How to Keep Fit* (London: Jarrold and Sons. Pp. 131. Price 1*s.* net) can also be warmly commended. They are as follows: Alcohol in Relation to Health, by Mr. W. McAdam Eccles; Diet, by Sir Robert W. Burnet; Clean Mindedness, by Sir Dyce Duckworth; The Value of Discipline in the National Life, by Sir R. Douglas Powell; Dress, by Mr. James Cantlie; and Chastity, by Sir Francis H. Champneys. It would be possible, perhaps, to find a few statements here and there with which all would not agree, but, speaking generally, the lectures are models of their kind. The paper of Sir Francis Champneys deserves special commendation. It is a plain-spoken, yet entirely reverent, treatment of the sexual difficulty. The articles generally are characterised by directness, moderation, and sound sense.

That greater diffusion of knowledge as to the many evils which result from the undisciplined use of the sexual instinct is needed will not be denied, but how such diffusion should be effected is a question upon which there may be a marked difference of opinion, for many who will agree with Mrs. Creighton on her general thesis would differ perhaps from her in the places where limitations to knowledge and its spread should begin. Mr. FRANK G. LAYTON, M.R.C.S. Eng., the author of *Philip's Wife*, a play in three acts (London: A. C. Fifield. 1914. Pp. 64. Price 1*s.* net), is probably well within the mark when he says in his preface that it is unlikely the play will be produced in England—at any rate for a long time, though, as he also says, "the play is not improper." Philip's wife, who gives the title to the play, is the daughter of a clergyman who is much opposed to any teaching concerning sexual matters, and who is antipathetic to medical men. Philip, the son of a worldly and socially ambitious merchant, has been "indiscreet" in his college days. Anxious for an early marriage and urged by his father he scorns medical advice and becomes the victim of a quack. The result of this defiance of medical authority in the supposed interests of social position is well told. The bigotry of the clergyman is perhaps a little overdrawn, while the conversations between the practitioner and the consultant do not ring quite true, but the play is eminently readable, though the subject is somewhat unsavoury. Mr. Layton states in his preface that his play was written before he had ever heard of Brieux's famous *Les Avariés* (*Damaged Goods*. Same publishers and price. Pp. xxiii.-65), of which a new translation by JOHN POLLOCK has just appeared, with interesting preface and foreword by Mr. G. Bernard Shaw and Mrs. Bernard Shaw respectively.

JOURNALS AND MAGAZINES.

Jahreskurse für Aerztliche Fortbildung. Munich: Lehmann. Price 18 marks per annum.—The May number is devoted to a review of neurology and psychiatry. Professor Marburg writes on the recognition of operable tumours of the spinal cord, including localised spinal meningitis serosa. Amongst other signs mentioned are the albuminous and often yellowish character of the cerebro-spinal fluid, the radicular distribution of the pain, paræsthesia, and palsy, and the Brown-Séquard dissociation of sensation. It is pointed out how accurately all the symptoms may be mimicked by spinal meningitis serosa, either diffuse or circumscribed in the form of cysts by adhesions, but fortunately the treatment is the same, namely, laminectomy. The indications for Förster's operation of posterior rhizotomy are then discussed, and a general summary of recent advances in neurology follows. The articles on mental diseases include one on prognosis, with especial reference to general paralysis of the insane treated by salvarsan given by various means; great improvement is reported in some cases. The prognosis in dementia præcox and other conditions is also debated. The pathological anatomy of various forms of mental disorder has received much attention lately, and some important findings are discussed, such as the demonstration of spirochætæ in the brain in parasyphilitics. The final article deals with serology in mental disease.—Diseases of children form the topic in the June number, and the great bulk is devoted to a consideration of the heart in childhood, by Langstein and Putzig. The normal condition of the heart in infancy is first described, including the electrocardiogram and X ray findings. Then follows a discussion of the import of deviations from the normal rhythm, such as extrasystoles, tachycardia, gallop rhythm, and heart-block; next, the writers deal with hypertrophy, dilatation, and congenital heart disease. Skiagrams appear to be used extensively in making the diagnosis of hypertrophy. Pericarditis and affections of the myocardium and valves are also considered. The usual general review of children's diseases follows. There is mention of what German observers are calling "spasmophilia," including tetany of alimentary origin and the allied spasmodic affections. Cow's milk and calcium salts constitute the best treatment.

The American Journal of Tropical Diseases and Preventive Medicine, Vol. I., No. 10 (the official organ of the American Society of Tropical Medicine).—This number contains three editorials and three original articles in addition to the usual notes and comments and the reviews of current literature. The first of the editorials is signed by Dr. C. C. Bass, of Tulane University, and deals with hookworm disease, which is characterised as a world-disease of long duration, and one "which destroys hundreds of thousands of lives yearly, and leads to the loss of countless millions of money through the reduced efficiency of its victims." Dr. Bass calculates that out of the 1,600,000,000 of people inhabiting the globe more than 4,500,000 are at present suffering from ankylostomiasis. Even now, he says, "man is pouring daily into the ever-empty stomach of this blood-sucking parasite a veritable river of his life-blood." The second editorial deals with preventive medicine and syphilis, while the third discusses prostitution in Europe, and is signed by Dr. Isadore Dyer, one of the two joint editors of the journal. The first of the original articles is also on the subject of hookworm disease or ankylostomiasis, and is illustrated by two plates. It is contributed by Passed Assistant Surgeon C. M. Fauntleroy, of the United States Public Health Service. Incidentally he mentions that during an investigation of the disease in some rural districts of the Southern States no fewer than 21,308 houses were found which had no privy at all. It is, therefore, not surprising that the infection has become widespread in that region. Dr. Fauntleroy remarks that an estimate of more than 2,000,000 of cases of ankylostomiasis in the United States is probably not an exaggeration. The second article is on beri-beri, by Dr. Paul G. Woolley, of the University of Cincinnati, and in it he gives a fairly good résumé of the present state of our knowledge of this important disease. The third article is on preventive vaccination against typhoid fever, and is contributed by Professor A. Chantemesse, of Paris; it has already been published in *Le Monde Médical*, and has been translated for the journal by Dr. Charles Chassignac, of New Orleans. Professor Chantemesse, like many more experts, prefers a heated monovalent vaccine to a polyvalent one.

Æsculape (Paris: 41, Rue des Ecoles. Foreign subscription 15 francs; single number 1.50 francs).—The June number of this illustrated review of the arts and letters in relation to medicine and science contains some interesting items. Professor Félix Regnault discusses the medico-psychologic characteristics of some of the work of Michael Angelo—the tombs of Julian II. and Lorenzo dei Medici, the Aurora, and the Twilight.—Dr. Bonnette gives some interesting details of the health and medical attendants of the great Napoleon.—Dr. P. Barutaut begins an article on the legends of the sirens, illustrating it with examples of symmelus sympus, the condition on which the siren conception is based.—Dr. E. Sirard gives a first instalment of a biographical account of Théophraste Renaudot of Montpellier.—The article by Dr. Lucien Libert deals with the cultus of St. George and the treatment of insanity among the Greeks, and pays special attention to the monastery of St. George on Prinkipo, in the Sea of Marmora.—Dr. P. Finet publishes sonnets on François Helme and Robert Marquézy, and Dr. Jean Avalon gives an account of Yong-Fou, a courtesan of Peking; of Joyau Céleste, the favourite of the emperor; and of "M. de Pekin," the executioner of Peking, with a description of the revolting atrocities perpetuated on Fou-Tchou-Li, the attempted assassin of a prince.—There is also an account in the supplement of Mme. de Miramion, whose hôtel, now the central pharmacy of the hospitals, as was mentioned in the February number (reviewed in THE LANCET of April 4th), it is desired to acquire for a Museum of the History of Medicine in Paris.

The Hospital Gazette.—The June issue is a special number devoted to historical and constructional accounts of the Birmingham hospitals. It seems that Birmingham is possessed of almost as great a variety of institutions as London. Mr. Howard J. Collins describes the General Hospital and Mr. Arthur Hulme the Queen's Hospital. The Free Hospital for Sick Children, the Eye Hospital, the Hospital for Women, the Ear and Throat Hospital, and the Hospital for Skin and Urinary Diseases, all of which have "Birmingham and Midland" as part of their titles, are described by their secretaries, as also are the Royal Orthopædic and Spinal Hospital, the Birmingham Dental Hospital, the Birmingham and Midland Counties Sanatorium, and the Moseley Convalescent Hospital for Children. The number closes with a history of the convalescent homes of the Birmingham Hospital Saturday Fund at Tyn-y-Coed (men) and Marle Hall (women), Llanrhos; the Red House, Great Barr (children); and the Romsley Hill Home (Sir William Cook memorial) for Consumptives.

POOR-LAW MEDICAL OFFICERS' ASSOCIATION OF ENGLAND AND WALES.

THE annual meeting of this association took place on July 2nd at Burnley. The MAYOR (Alderman J. Sellers Kay), in welcoming the members in the council chamber of the Town-hall, alluded to the dispute which had been going on in Burnley for some 18 months between the Poor-law medical officers and the Poor-law authorities. He held no brief for either party, he said, and if as Mayor he could be of any assistance in bringing about a settlement, he would be pleased to render that assistance.

Surgeon-General G. J. H. EVATT, President of the association, then took the chair, and spoke first of the pleasure with which he had inspected the Poor-law hospital in Burnley. He had also visited the general hospital, and as far as he could see the Poor-law hospital was the better. The council of the association, he said, regretted that friction should have taken place between the Poor-law medical officers and the authorities, and thanked the Mayor for the offer of help.

Mr. A. E. BIRD, honorary secretary of the Burnley Division of the British Medical Association, extended a welcome to the meeting.

After the minutes of the last annual meeting had been read, confirmed, and signed by the chairman, the annual report of the council and their report on the Poor-law Institutions Order were unanimously received and adopted, and the honorary secretary was instructed to send a copy of the latter to the Local Government Board. The balance sheet for the year was then considered by the meeting, and its details were explained by the honorary secretary, and it was unanimously approved. Surgeon-General Evatt, president, and Dr. Major Greenwood, honorary secretary, were re-elected to their posts for the ensuing year with acclamation. Mr. A. A. Napper was re-elected treasurer and Dr. A. Withers Green auditor. Mr. D. B. Balding was also re-elected chairman of council. The following were elected members of council for 1914–15:—Mr. W. Holder (Hull), Mr. J. B. G. Gidley-Moore (Fyfield), Dr. Lloyd Brown (Tunbridge Wells), Mr. P. Withers Green (London), Mr. George Jackson (Plymouth), Dr. A. Drury (Halifax), Mr. C. Biddle (Merthyr Tydfil), Dr. C. Thackray Parsons (London), Dr. W. Brown (Bristol), and Dr. A. P. Agnew (Burnley).

Mr. C. E. BYGRAVE, clerk to the guardians of the Blackburn Union, then read a paper on Recent Legislation Affecting the Duties of Poor-law Medical Officers. He attributed the diminution in the number of persons in receipt of out relief between 1910 and 1911 to the removal of old-age pensioners from the outdoor relief. The need for institutional medical treatment did not seem to be diminished as a result of the National Insurance Act.

Dr. MAJOR GREENWOOD read a paper on the Future of the Poor-law and the Poor-law Medical Service. He believed, he said, that in the future the work would develop more and more on institutional lines, and all indoor Poor-law medical officers would tend to become whole-time officers. Unions might combine to create a common infirmary, or the Poor-law infirmary might become a State institution and be utilised in connexion with State schemes for changes in the general medical practice of the country. The National Insurance Act was considered by many to be a step in that direction.

In the evening the annual dinner was held at which Surgeon-General Evatt presided over a good assembly, having the Mayoress (Mrs. Sellers Kay) on his right hand and the Mayor on his left.

MEDICINE AND THE LAW.

Proceedings under the Apothecaries Act, 1815.

AT the Bow county court on June 29th the Society of Apothecaries recovered a penalty of £20 against John Charles Purdue, described as a medical herbalist, of 28, Roscoe-street, Canning Town, for a breach of the Apothecaries Act, 1815, in that he had acted and practised as an apothecary or medical practitioner in attending and medically treating the infant daughter of Arthur Thompson, of 21, Scott-street, Canning Town, whose death in January last was the subject of an inquest conducted by the local coroner. It appeared from the evidence that the child had become ill on Tuesday, Jan. 27th, and was taken by her mother to the defendant's shop, who examined her and said that she was suffering from pneumonia. He further gave the mother medicine for the child and oil to rub her chest with. He was again summoned by the mother to see the child on the same afternoon, and then administered further medicine, also using the stethoscope and taking the child's temperature with a clinical thermometer. The defendant attended the child further on the Wednesday, Thursday, and Friday, on the evening of which day the child died. The defendant was paid the sum of 2s. in respect of his medicine and attendance. It appeared from the medical evidence given at the inquest that the child actually died from meningitis. At the hearing of the case the defendant's counsel endeavoured to argue that he was protected by a statute of Henry VIII. sometimes called the Herbalists Act. The county court judge held that the statute was inapplicable and that there had been a clear breach of Section 20 of the Apothecaries Act, 1815, and he consequently gave judgment for the society with costs on the higher scale.

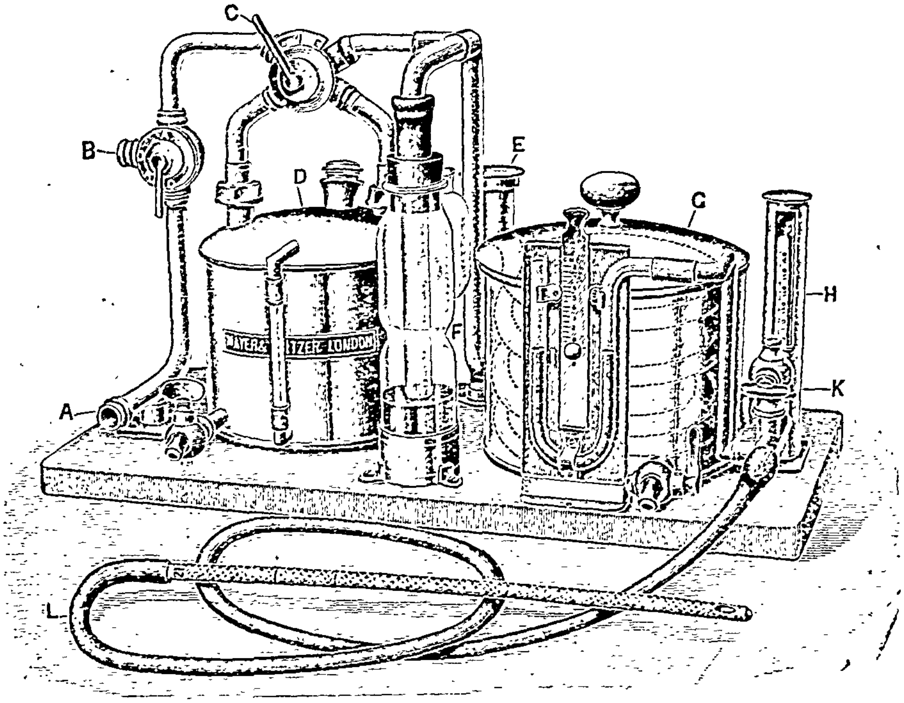
THE PANAMA-PACIFIC INTERNATIONAL EXPOSITION AT SAN FRANCISCO.—This exposition, which will be opened on Feb. 20th, 1915, in view of the fact that the canal could not have been successfully carried out but for the aid rendered by medical and sanitary science, will devote much attention to medical matters. Among the exhibits will be hospital wards in the tropics, a huge model of a mosquito by Philip Rauer, to demonstrate the dangers of the insect, a model emergency hospital, civic and health exhibits from the Urban Exhibition of Lyons, and the whole of the British exhibit from Ghent, as well by Argentina, Japan, France, Germany, the Philippines, and 30 other countries. Large industrial concerns will display their health and human welfare and life protecting methods. The Rockefeller Foundation will display measures for the eradication of hookworm. Other bodies taking part are the Russel Sage Foundation, the Carnegie institutions, the Social Survey, the American Academy of Medicine, the National Commission on Mental Hygiene, several special medical organisations, antituberculosis societies, the International Congress of Nurses, and many others. There will also be a dental congress.

New Inventions.

APPARATUS FOR INTRATRACHEAL ANÆSTHESIA.

THE principles and advantages of intratracheal insufflation are now well known. Apart from its use as a method of artificial respiration and in thoracic surgery, it has been found, for example, to be invaluable in the surgery of the head and neck, and more especially in operations on the thyroid, mouth, pharynx, and nasal passages. Various apparatus have been devised, and the description of one which I have used for 18 months appeared in the *British Journal of Surgery* for July, 1913, and in the *Bristol Medico-Chirurgical Journal* for December following. Alterations in this have been made from time to time, and with the object of still further reducing cost and weight the present apparatus has been made for me. It is compact, light, portable, and easy to manipulate. It can be used either with a foot pump or with an electric motor and pump. (Fig. 2.) The former is provided with an air filter, which serves the double purpose of freeing the air from dust, &c., and of converting the intermittent air stream into a constant one. The foot pump does not give such a regular anæsthesia as a mechanical device, such as a motor, and entails rather hard work upon the anæsthetist during a long operation, but it is a very fair substitute. Where the motor is used, a foot pump should always be at hand in the rare event of a failure of the electric current.

FIG. 1.

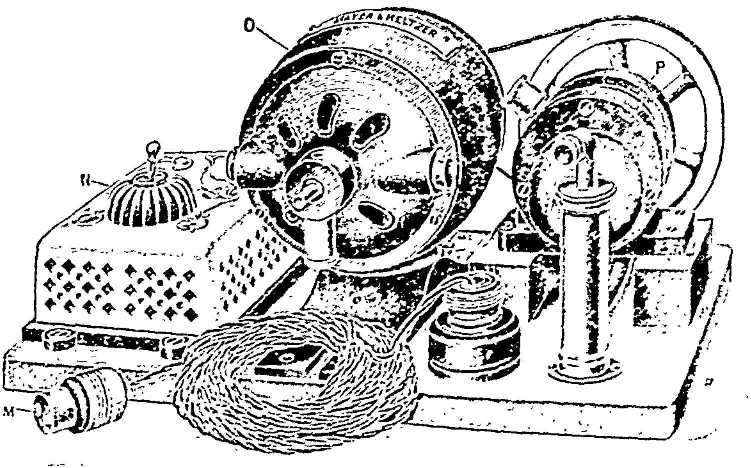


The ether apparatus (Fig. 1) has all its parts readily accessible, and the ether chamber D, made of metal, can be easily detached and cleaned. There are very few rubber connexions to get out of order, and the apparatus can deliver a very concentrated ether vapour. The air stream enters at A and mixed with oxygen, if necessary, by means of the tap B, can be made to pass by a turn of the regulating tap C either wholly over the ether or in any desired proportion, or wholly to miss the ether. The air-ether mixture, or air alone, then passes along to the moistening chamber E, thence to the warming vessel G, and so on to the catheter L. A manometer, I, and mercury safety valve, F, are placed in the circuit, the latter being designed with an overflow cup to catch any mercury blown up when the pressure exceeds, e.g., 20 mm. Hg. The safety valve can also be set to blow off at other pressures. The temperature of the outgoing stream of air and ether can be ascertained by means of the thermometer H. A tap, K, is provided for reduction at regular intervals in the volume of the air stream. The water in the warming chamber can be readily kept warm (usually 120° F. is the right temperature) by renewing it at intervals of about 10 minutes. An electric heater has not been supplied because of the additional cost; a spirit lamp is probably quite safe if properly guarded, but I have not cared to run any risk with so much ether close at hand. This part of the apparatus weighs just over 9 lb. and is carried in a light case made of 3-ply wood.

The motor (Fig. 2, O), of 1/16 h.p., must be chosen to suit the special voltage. In my own practice, I have found it a convenience to use a motor of 105 volts continuous current, with a carbon lamp in the circuit, so that the apparatus can be run on any continuous current from 100 up to 250 volts. The motor drives a rotary pump, P, which sends a constant stream of air through the filter R. The speed of the motor and strength of the air blast are regulated by the resistance N. A plug, M, is for connexion to the electric main.

My thanks are due to Messrs. Mayer and Meltzer, of Great Portland-street, London, W., for the care and trouble they have taken in making this apparatus, the special catheter, and the direct laryngoscope, which is a modification of Hill's well-known pattern.

FIG. 2.



Queen Anne-street, W. FRANCIS E. SHIPWAY, M.D. Cantab.

The Value of Albulactin in Augmenting the Colloid Element in Cow's Milk.

While the action of reversible colloids in preventing irreversible colloids from coagulation has been understood only in recent years, it has long been known that certain substances prevent the casein of milk—an irreversible colloid—from coagulating in large, thick curds when used for infant-feeding.

Recent investigations have shown that the reason why human milk forms soft, highly-comminuted flakes in the infant's stomach is because it contains much reversible or protective colloid in the shape of milk-albumin. Cow's milk contains very little of this substance, hence the large, tough curds it forms in the infant's stomach.

More than this, the problem of artificial infant-feeding is further complicated by the fact that by far the largest proportion of proteid in human milk exists as milk-albumin, while there is relatively little in cow's milk. Dr. Still's analysis proves this strikingly.

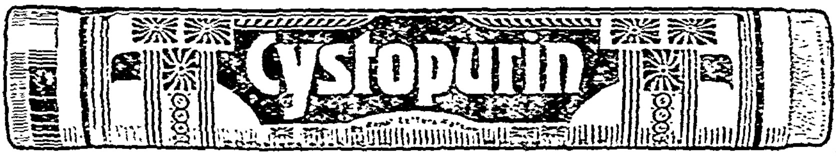
Dr. G. F. STILL'S Analysis is:

	HUMAN MILK (2% Proteid)	COW'S MILK (4% Proteid)
Casein	0·6	3·25
Milk-albumin	1·4	0·75

When cow's milk is diluted to make the total proteids agree in quantity, the child gets 1·6 per cent. of casein and only 0·37 per cent. of milk-albumin, or nearly three times more casein than it ought and only a quarter of the milk-albumin.

If the milk is further reduced to make the casein proportion correct, the milk-albumin is reduced to about one tenth of what it ought to be. The solution of the infant-feeding problem, therefore, resolves itself logically into the addition of sufficient milk-albumin to supply the necessary protective colloid and to furnish enough easily-digested proteid. This is best done by Albulactin, which is simply pure, sterile, soluble milk-albumin, and is being extensively used by the Profession.

Samples and literature on application to A. Wulfing & Co., 12, Chenies Street, London, W.C.



A Reliable and Effective Drug in

Gonorrhœa and Septic Diseases of the Bladder.

THIS is a *new drug*, consisting of a double salt of Hexamethylene-tetramine with Sodium Acetate and water of crystallisation.

A Surgeon, writing in *The Lancet*, Aug. 2, 1913, says: "**Cystopurin can be employed freely, safely, and effectively in all affections of the urinary tract,** whether of toxic or bacterial origin. It has the particularly satisfactory result of clearing away septic conditions associated with tuberculosis of the kidneys."

Cystopurin diminishes the amount and thickness of the discharge in Gonorrhoea, it relieves the pain and promotes free diuresis, and if used sufficiently early, the disease is localised to the anterior urethra, complications are prevented, and the duration of the attack is shortened.

In all diseases wherein the urine is septic, turbid and evil-smelling, Cystopurin has proved of the greatest clinical value after the failure of other urinary antiseptics.

The action of Cystopurin does not, however, depend upon any assumed liberation of Formic Aldehyde in the urine, but is due to the specific effect of Hexamethylene-tetramine which is hurried to the bladder, before it becomes decomposed, by the diuretic action of the Sodium Acetate.

Dr. Loose (*Deutsch. Med. Woch.*, 1907, No. 2) says: "Cystopurin is a chemical substance able to influence the lymph stream in the areas with which it comes in contact, and is one which cures by a process similar to that seen in artificial hyperæmia."

From *The Lancet*, Aug. 23rd, 1913.

"Cystopurin has been [illegible] very favourably in the treatment of tuberculosis of the urinary tract. . . . The presence of sodium acetate in the molecule appears to secure a specific effect, whether the urine is ammoniacal, alkaline or neutral. The diuretic action of the [illegible] is an obvious advantage."

THE LANCET.

LONDON: SATURDAY, JULY 11, 1914.

yal Commission on Venereal Diseases.

Commissioners appointed to inquire into
evalence of venereal diseases in the United
om, a strong and well-chosen body, have been
evidence now for eight months as to the
upon the health of the community of these
ions and as to the means by which such
can be alleviated or prevented. Short,
mes very short, abstracts of this evidence
een regularly published in THE LANCET, so
ur readers are already familiar with the
ons which the inquiry has so far taken. It
nderstood that no return to the policy or
ions of the Contagious Diseases Acts of 1864,
r 1869 was to be regarded as falling within
ope of the inquiry, but with that limitation
mmission has made an extremely all-round
igation.

interim report of the proceedings up to
6th has now been issued. Up to that
the Commissioners had held 32 meetings
xamined 36 witnesses, with the result
hey found the branches of inquiry involved
e terms of reference to be so numerous,
a some cases so closely interrelated, that it
mpossible to deal with them separately,
eting one branch before entering upon
er. Many lines of investigation are still in-
ete, and evidence is required from Government
tments, as well as from private individuals
o speak with expert knowledge, before any
al or special conclusions can be arrived at.
tics are being prepared for the Commissioners
rtain hospitals and institutions which will
to be taken into serious count by the Com-
oners before they can commit themselves to
ecommendations. But they are unanimously
inion that it may be an advantage to the
if the minutes of the evidence taken between
7th, 1913, when the Commission held its first
g, and April 6th, 1914, were now issued to the
c, a point of view with which we are heartily
cord. The sittings of the Commission were
privately, with the idea presumably that
ble witnesses might be embarrassed by
city when striving to assist the inquiry in
of its phases. There is no indication in the
im report that this trouble would have arisen.
an appeal to the proprietors of responsible
als, made when the sittings commenced, would
probably removed apprehension on this score. The objections to the policy of closed doors are, however, largely removed by the publication in accessible form of the proceedings.

We recommend to all our readers the perusal of the interesting evidence given by well-selected witnesses which is appended to the first interim report.[1] When the conclusions of the Royal Commission are arrived at, and the consequent suggestions come under the consideration of Government, the procedure adopted will necessarily have a direct medical bearing. The public will expect the medical profession to give advice as to the value or practicability of any legislative steps that may be taken. The prevention of the ravages of venereal diseases is a subject in which at last the inhabitants of this country are seriously interested. The brief abstracts of the evidence taken by the Royal Commission which have so far appeared have helped to spread and also to intensify that interest, and we may be certain that the termination of the labours of the Commission will be the signal for the introduction of legislation of the greatest importance and also of the greatest delicacy. The difficulties surrounding both notification and the institution of clinics for treatment, which have to be faced, are certain to lead to the expression of strong opinions, and it is to the medical profession that the public will look for guidance.

Artificial Parthenogenesis and Fertilisation.

RÉAUMUR, BONNET, and other naturalists of the eighteenth century established the fact that plant lice bring forth live young without pairing. In 1845 the observations of DZIERZON on parthenogenesis aroused the greatest interest. He was led to the conclusion that male bees—the drones—arise from unfertilised eggs, workers and queens being the issue from fertilised eggs. When a queen bee after the so-called nuptial flight lays an egg in the larger drone cell, the egg passes through the oviduct without any sperm being pressed out from the receptaculum seminis; but if laying an egg in a worker cell, a trace of sperm is pressed out on the egg and so the egg is fertilised. Parthenogenic phenomena have been known through many observations to occur in certain butterflies, but it was the investigation of the natural parthenogenesis of the Bombyx mori, or silkworm, which formed the starting point of artificial parthenogenesis, with its array of facts and suggestions that may come to be of high significance in medicine.

The next step was taken when HERTWIG about 1892 observed that the unfertilised eggs of certain sea urchins may show the beginning of even cell division if they remain long enough in water. In the same year Professor LOEB began his now classic

---

[1] Appendix to the First Report of the Royal Commission on Venereal Diseases (Minutes of Evidence). London: Wyman and Sons, Limited. Price 3s. 6d.

investigations on artificial parthenogenesis, employing chiefly the eggs of certain sea urchins. In his admirable volume, which has recently appeared,[1] he gives us step by step the evolution of his ideas on this subject and shows how he put them to the test of experimental investigation, and by this means opened up an entirely new field. First arose the idea whether it were not possible to cause unfertilised sea urchin eggs to develop into larvæ after altering the constitution of sea water, such as by the addition of salts, acids, or alkalies. This was shown to obtain. There is but one criterion which enables us to decide whether the agent has an effect upon the egg similar to the spermatozoon, and that is development of the egg into a larva. The mere initiation of cell division is not sufficient. Professor LOEB gives an insight into the physico-chemical nature of the process of development, and his book is intended not only for the zoologist, but more especially for the pathologist, and chemist. The unfertilised egg dies in a very short time—hours or weeks; the fertilised egg lives indefinitely, and Professor LOEB shows that for the "mysterious complex" called a living spermatozoon there may be substituted well-known chemical and physical agents. The spermatozoon causes two kinds of effects—one development and the other transmission of the paternal characteristics to the developing embryo. It is probable that these effects are connected with quite different materials in the sperm. It is possible with heterogeneous fertilisation to obtain only the developmental result. Without oxygen the fertilised egg can neither segment nor develop. The formation of a fertilisation membrane round an egg is one of the fundamental facts of egg development. In 1905 Professor LOEB found that a short exposure of an egg to a solution of a fatty acid—e.g., butyric—in sea water led to the formation of a typical fertilisation membrane, as do many other substances, and indeed all hæmolytic agents—to quote his words, "all hæmolytic agencies effect the activation of the unfertilised egg, and this activation consists in a cytolysis of the cortical layer of the eggs." Another process is still required, a corrective process, since the membrane formation alone tends to rapid disintegration of the egg. This second process consists in submitting the egg for a short time to a hypertonic solution containing oxygen or for a longer period to sea water free from oxygen. The most surprising fact, however, in our present knowledge of artificial parthenogenesis is that the blood even of mammals and the tissue extracts of many different species will cause the fertilisation of the unfertilised egg of the sea urchin (and other animals) to form a fertilisation membrane, which will develop if subsequently treated with a hypertonic solution, while the blood and tissue extracts of their own species have no such effect. The efficacy of blood serum may be increased by the addition of $SrCl_2$ to the serum.

The subject of heterogeneous hybridisation, the effects of radium on the sperm, the combination of artificial parthenogenesis and fertilisation with sperm in the same egg and the conditions for maturation of the egg are all subjects of importance to scientific medicine, now that the need for a better understanding of heredity is generally recognised. Professor LOEB supplies also an extensive array of facts on artificial parthenogenesis in the eggs of starfish, annelids, molluscs, and frogs, and also in plants; he describes the preservation of the life of the egg by the act of fertilisation and the relations between artificial parthenogenesis and heredity, and discusses the question as old as the time of LEEUWENHOEK, Can an embryo develop from a spermatozoon?—a question that he finds cannot yet be answered in the affirmative. It would be difficult to estimate the far-reaching effects of the results of his experiments. They mark a new era in the study of fertilisation, as well as give a new impetus to those who see in so-called vital phenomena a large field which day by day is gradually becoming more circumscribed as the facts of physics and chemistry are seen to apply to the elucidation of many phenomena hitherto recognised as vital. We have to thank Professor LOEB for a brilliant and suggestive monograph—a monograph that will prove a good argument for those who desire to see our medical students equipped with a thorough knowledge of the facts of physics and chemistry that bear directly on the problems of biology. Professor KING's admirable translation brings Professor LOEB'S work within the general scope.

◆

Joseph Chamberlain.

BY the death of JOSEPH CHAMBERLAIN at the end of last week, after a practical retirement for eight years, the country has been generally stirred. Admiration at his achievements has been in no way stifled by the fact that in certain obvious directions the country eventually refused to follow his course; the singleness of purpose, the courage and tenacity, the incisiveness of speech and action of this great man, have been vividly recalled to us by his final removal from the scene of his activities. It would not be easy for either practised historian or political contemporary to prophesy exactly what position JOSEPH CHAMBERLAIN will occupy in the minds of posterity as a statesman, but as the greatest of Colonial Secretaries he will be remembered, and in this capacity medicine will always do him honour.

Only so recently as June 23rd the Secretary of State for the Colonies, Mr. LEWIS HARCOURT, unveiled at the Albert Dock Hospital of the Seamen's Hospital Society two bronze portrait reliefs of JOSEPH CHAMBERLAIN and his son, Mr.

[1] Artificial Parthenogenesis and Fertilisation. By Jacques Loeb, Member of the Rockefeller Institute for Medical Research. Originally translated from the German by W. O. Redman King, Assistant Lecturer in Zoology at the University of Leeds, England. Supplemented and revised by the Author. London: Cambridge University Press; Chicago: The University of Chicago Press. 1913. Pp. 312. Price 10s. net.

AUSTEN CHAMBERLAIN, in commemoration of their magnificent services in the cause of tropical medicine and preventive hygiene, and more especially in the establishment of the London School of *Tropical Medicine*. This school, to which the adjacent Albert Dock Hospital affords opportunities for clinical work, was founded and endowed chiefly through the efforts of JOSEPH CHAMBERLAIN, who as Secretary of State for the Colonies early realised that one of the bitterest difficulties in imperial administration, and one of the chief obstacles to the development of the tropical and subtropical dependencies under the British flag, lay in the devastations caused by diseases peculiar to the regions. The proof that malaria was not an inherent factor of tropical residence, but due to an avoidable cause, led him at once to grasp the probability that most, if not all, of the chief tropical diseases might be avoidable as the result of especially directed research. The propagation of malaria by the bites of an infected insect might have its other pathological counterparts. Taking counsel mainly with Sir PATRICK MANSON, at that time medical adviser to the Colonial Office, he determined on the organised prosecution of such research, and with the energy that marked his prosecution of political ends at once set about realising his plans. In May, 1899, he presided at a banquet organised in behalf of the endowment of tropical research when there was raised the sum of £15,000, with which in a few months laboratories were erected in the neighbourhood of the Albert Dock Hospital, and the London School of Tropical Medicine was opened, in which 70 students enrolled themselves. By 1905 the school, whose utility had been apparent from the first, had become an established success, and had outgrown its accommodation. In that year CHAMBERLAIN again came forward and raised a further £10,000, which provided a library, a museum, and a special tropical ward, whereby the number of beds for clinical study was raised to 50. His efforts attracted private donors, while grants were made by the Treasury, and an annual contribution of £850 towards the working expenses was sent by the Crown Colonies in appreciation of the benefits conferred by the school. We need not expatiate on the value of the work done by the London School of Tropical Medicine, but every development of that work has been a stone in CHAMBERLAIN'S memorial pillar. Commissions and research workers were soon sent out to various parts of the world to prosecute special researches on the spot. Malaria, sleeping sickness, sprue, guinea worm, tropical dysentery, and ankylostomiasis have all undergone continuous investigation with great gain to the health and saving in the lives of those whose duty calls them to labour in tropical climates. What better evidence can be adduced of this gain than the fact that the death-rate of the West Coast of Africa, of erstwhile terrible notoriety, has fallen from 23 to 8 per 1000, while the number of officials annually invalided has dropped from 62 to 28? The number of students in the London school is now nearly 200; 1800 have had their training there, and of these some 700 are bringing the special knowledge thus acquired to the service of their country in the Colonial Medical Service. That the country is now fully alive to the great benefits conferred on it by the London school is shown by the fact that within a few months Mr. AUSTEN CHAMBERLAIN has been able to raise a further sum of £73,000 for endowment of the school.

In CHAMBERLAIN'S achievements in the field of tropical medicine are clearly to be discerned all the qualities of personal character which lift the statesman above the politician—a spaciousness of view to envisage a problem as a whole, insight into the underlying factors of success or failure, knowledge of men to select those most competent to work effectually in the attainment of the end, forcefulness to attach them to his aims, clarity of expression to communicate his visions to the world at large, and a whole-hearted and single-minded devotion to the highest and widest aims untinctured with mere Chauvinism or self-seeking. As his field of endeavour widened from municipal to national, from national to imperial, from imperial to world-wide betterment, his ideals expanded without changing their essential character. The principles and methods he had successfully proved in more restricted fields were adapted to wider issues. He was, in truth, the great Elizabethan of our age.

Annotations.

"Ne quid nimis."

BOVINE TUBERCULOSIS.

THE Board of Agriculture and Fisheries has issued an amended Tuberculosis Order relating to the compulsory slaughter, with compensation, of bovine animals affected with certain degrees of tuberculosis. The new Order, which comes into operation at once, simplifies the basis of the compensation to be paid, which is now to be the estimated market value of the animal, while a circular which accompanies the Order states that the Treasury contribution to the expense of the local authorities concerned will in future be on the basis of three-fourths of the compensation money instead of one-half, as previously authorised. The animals which are subject to notification and compulsory slaughter are those with emaciation due to tuberculosis, those with a chronic cough and showing definite clinical signs of tuberculosis, and cows with tuberculosis of the udder or giving tuberculous milk. As in the case of the 1913 Order, the notification of any one of these forms of tuberculosis entails a visit by the veterinary inspector of the local authority under the Diseases of Animals Act, who is required to extend his examination to other bovine animals on the premises. It does not appear, however, that this further examination is to be made with the object of applying the tuberculin test to detect early tuberculosis, or of advising or assisting the farmer to separate the reacting animals from the rest of the stock, and so ultimately to obtain a herd free from the disease; the Order and circular endeavour to limit the inspector's activities as much as possible to the detection of the advanced cases for which compensation is payable. There is thus some risk that the ease with which the animals with advanced tuberculosis can be disposed of, and substantial compensation obtained, will reconcile the cow-keeper to allowing tuberculosis to spread in the dairy herd without taking measures to detect and separate cases of incipient tuberculosis or to rearrange his cowsheds so as to minimise cow-to-cow infection. Among other matters which are left in a somewhat uncertain state by the Order, we note that the local authority is directed to dispose of the carcass of the animal to the best advantage, and in cases where the carcass or a portion thereof is likely to be saleable for human consumption to obtain the removal of the animal to a slaughter-house for the purposes of slaughter. It is advised that the local authority for the purposes of the Order, which is not necessarily the sanitary authority, should confer with the latter body so that steps may be taken to guard against the use in such cases of diseased meat for human food; but it is not clear how this dual responsibility can be effectively discharged in the case of private slaughter-houses in the country, and many difficulties seem likely to arise unless a more definite instruction is given. The Order, like its predecessor, will be welcome from the side of public health to the extent that it aids in the early removal of cows giving tuberculous milk from the milk-supply, and is not merely used to get rid of the "piner" or "waster" when its value for milking has almost ceased. At present its administration by local authorities seems to be practically independent of the information obtained by public health authorities as a result of their examination of milk for tubercle bacilli, but it is to be hoped that the Milk and Dairies Bills for England and Scotland will soon be enacted and enable the necessary adjustments to be made and secure that the large sums to be paid from national funds are expended with satisfactory results to the consumer of milk as well as to the cow owner.

THE PRESCRIBING OF NARCOTIC DRUGS.

In connexion with the International Opium Convention events are so shaping themselves that it will be necessary before long for all the Powers concerned to complete their plans for the passing of domestic legislation to give effect to the provisions of the Convention. For some time our own Foreign Office and other departments have had the matter under consideration, and with the object of obtaining expert opinion on various points have consulted representative medical and pharmaceutical bodies. The Government will be bound by the provisions of the Convention to enact such regulations as will prevent, as far as possible, the illicit distribution of opium, morphine, cocaine, and other drugs having similar properties; but there appears to be nothing in the articles of the Convention to compel the Government to amend the law as to the sale of poisons in such a way as to alter existing practices in connexion with the prescribing and dispensing of the narcotic drugs in question. Nevertheless, it may be found expedient, in order to enforce the spirit of the Convention, to do things which its actual terms do not require to be done; and it is evident from the nature of the inquiries that the authorities are causing to be made that the question of placing some sort of limitation on the currency of prescriptions for narcotic drugs is being seriously considered. Thus the Under Secretary for Foreign Affairs has asked the opinion of the Council of the British Medical Association on the suggestion to lay down that a medical practitioner should state in his prescription the number of times it may be dispensed and to require pharmacists to comply with this limitation under penalty. The Under Secretary has been informed that the Association has long recognised the dangers arising from the ease with which persons in this country can obtain powerful drugs by means of a medical man's prescription, and that it is of opinion that legislation should be introduced to provide for the limitation of such prescriptions in the manner suggested. This is sound advice, and the only difficulty that can be foreseen is that practitioners might occasionally forget to write the necessary instructions on their prescriptions, which could then be dispensed an unlimited number of times, as at present. This difficulty, it may be suggested, could be overcome by framing the regulations so as to require that prescriptions for narcotic drugs must only be dispensed once unless the contrary is stated in writing. The principle of the limitation of the currency of prescriptions is wholly commendable, and if it can be enforced without inconvenience in other countries there appears to be no reason why it could not be adopted in the United Kingdom.

SUBCUTANEOUS INJECTIONS OF AIR IN FIBROSITIS AND ALLIED AFFECTIONS.

In the *New Zealand Medical Journal* for March is published a paper, read at the recent Australasian Medical Congress in Auckland, on the subcutaneous injection of air in fibrositis and allied affections by Dr. A. Douglas. The method is of French origin and appears first to have been employed by Cordier in the treatment of neuralgia and sciatica. He stated that in 25 cases of the latter he had only two failures. Dr. Douglas finds that the method, which he has used some hundreds of times, is simple and safe, and gives prompt relief. A hollow needle, which for convenience should be larger than an ordinary hypodermic needle, is used. A platino-iridium exploring needle is very suitable and can be quickly sterilised in a flame. A bulb and tube, such as are used for a throat spray, are attached to the needle. A wisp of wool was originally inserted into the tube, where it was attached to the needle in order to filter the air, but experience has proved this precaution to be unnecessary, as infection never occurs. After sterilising the needle the skin and fat are picked up and the needle is thrust well into the cellular tissue, as in giving a subcutaneous injection. The needle is then withdrawn a little so as to avoid the least risk of inflating a blood-vessel, and air is pumped into the cellular tissue. An emphysematous swelling is produced and the air can be seen to course through channels under the skin, which vary greatly with the individual and site. As the air is slowly pumped in the left hand manipulates and distributes it throughout the affected area. The amount of air used must be judged by experience. In the lumbar region the swelling should be as large as that produced by a pint of saline solution. It is desirable that

mpanitic note over the whole of the affected
be obtainable, and in the case of a big
or thigh a considerable quantity of air is
essary. After withdrawing the needle it is good
tice to massage vigorously for a few minutes
is to distribute the air thoroughly, moving it
wards and forwards through the tissues. It is
etimes necessary to introduce the needle in
e than one place on account of deep attach-
its of the fascia limiting the injected air. Such
ndaries are well marked in the middle of the
. Little pain beyond that of introducing the
dle is produced, and the patient almost invari-
experiences immediate relief and moves with
h greater freedom. The air remains for several
s and is gradually absorbed. Dr. Douglas
s that sciatica is less amenable to the
itment than is lumbago. He thinks this
be due to the fact that in a large
portion of cases of sciatica there is arthritis
the hip-joint. The explanation of the mode of
on is not obvious. Dr. Douglas suggests that
air stretches the nerve terminations in the
ular tissue and acts somewhat like nerve
etching in sciatica. The following are two
mples. A man, aged 30 years, subject to
ibago, had an attack in which he could not
ve. Air was injected, and in a few minutes he
ld stand and pick up articles from the floor. A
n, aged 32 years, was subject to sciatica, which
netimes continued for months. He had under-
ie various treatments, including high-frequency
rents and electric baths. For the last few
irs he always returned for the air treatment,
ich was the most effectual.

ELIOTHERAPY IN SURGICAL TUBERCULOSIS.

THOUGH the value of heliotherapy in surgical
berculosis was pointed out many years ago by the
ench surgeons, Bonnet, Ollier, and Poncet, it has
come a recognised method on the Continent only
recent years. In this country a beginning has
arcely been made. In the special tuberculosis
umber of the *Interstate Medical Journal* Dr. G.
insdale has described the treatment on the French
ast and in the Swiss Alps. As far back as 1857
adame Duhamel, who cared for scrofulous children
Berck-sur-Mer, had them wheeled twice a day to
e beach, and after bathing them and washing
eir sores she refused to clothe them completely,
idently with the idea that the unobstructed
posure to sun and air would hasten their
covery. Now at this great French resort for the
berculous free access of sunlight is deemed the
sential feature of the treatment. The long
lleries or balconies at the Marine Hospital are
nstructed for the purpose of completely exposing
e body to sunlight. Here in summer the patients
nclothed spend the whole time from 6 A.M. to 5 or
P.M. Operation wounds are exposed from the
fteenth day, but operations are exceptional and
erformed only as a last resort. In Switzerland
he greatest impulse to heliotherapy has been given
y Rollier, whose remarkable results at Leysin have
ttracted much attention. He carries heliotherapy
stage further than his predecessors, who exposed
nly diseased parts to the sun. He exposes the
whole body. This he accomplishes gradually.
According to the gravity of the case he allows
rom three to ten days after arrival in the mountains
o elapse before beginning exposure. No matter
what the seat of the disease—hip, spine, or cervical glands—he begins by exposing the feet to the sun for five minutes at intervals of an hour five times on the first day; on the second day similar exposures of the legs are given; on the third day the thighs are also exposed; on the fourth day the abdomen; and on the fifth day the chest, when the precaution is taken of covering the heart with a damp cloth. If the condition of the patient permits the back is also exposed to the sun. Finally, on the sixth or seventh day the head and neck are exposed. As the skin becomes pigmented the duration of the exposure is increased. Hand in hand with the pigmentation the tuberculosis is cured. Rollier has succeeded in training his patients, both children and adults, so that they live almost nude in the open air of the Alps quite comfortably. Sunlight has considerably more actinic power in the mountains than at the sea level, but heliotherapy can be successfully practised at the latter.

PLAGUE CLOUDS IN THE WEST.

AT the present time plague clouds are appearing on the horizon and threatening to approach the United States. Although some of these clouds may as yet seem small and at a considerable distance away, they cannot be altogether disregarded. We have already on many occasions called attention in these columns to the danger arising from the protracted and extensive epizootic of plague among the hordes of ground squirrels which inhabit a large part of the State of California. American as well as other epidemiologists have long recognised the risks of a human epidemic originating at any time by extension of infection from ground squirrels to local rats, which often share the same burrows, and from rats through the agency of fleas to man. From time to time sporadic human cases of plague are reported in the affected districts of California, and these instances are invariably associated with infected ground squirrels; the last reported case of the kind occurred this year in May, and was fully confirmed by bacteriological examination. To the north of California, and separated from it by Oregon, is the State of Washington, abutting on the Pacific. On the coast of this State is the rising port of Seattle, on Puget Sound, not very far from the Canadian frontier, having important connexions with the interior by means of the Northern Pacific and other railways, and having also a considerable coasting as well as trans-Pacific trade. At the end of last year plague-infected rats were discovered along the water front of this city, and notwithstanding the strenuous local efforts to suppress the epizootic, other infected rodents have been found since then, week by week, up to the present time. Only one suspected fatal case in man has so far occurred, but so long as the rat population of Seattle remains infected so long will there be danger of the disease extending to man. A few days ago information reached us that on June 28th two persons in New Orleans had been attacked by plague; since then three more attacks have occurred with two deaths. Whether the two first cases were imported or were due to existing infection smouldering unrecognised in that city it is not possible as yet to say. Unless the sanitary condition of New Orleans has been greatly improved since 1912[1] it is hardly in a satisfactory state to resist the invasion of plague. The disease has also been occurring, in a dropping fire of cases, in the West Indian island of Cuba, which is under the protection of the United States, and with which it carries on a considerable commerce. Up to the middle of June, the date of the last reports, some 22 cases had been notified in Havana, the capital of Cuba and its chief seaport; the infection had been carried thence to the town of Artemisa, 35 miles south-west of Havana, and recently an epizootic of plague in rats had been discovered in the town of Jaruco, situated 26 miles south-east of the capital. It is possible that the two first cases in New Orleans may have been associated with the plague infection now existing in Cuba, as there is much trade between these ports. Lastly, it may be mentioned, in view of the increasing connexions now being established between the United States and the Isthmus of Panama, that plague, said to be of the pneumonic type, has been for some time and is still manifesting itself in Colombia, of which State the Panama Canal zone at one time formed part before its transfer to the United States. The correctness of the diagnosis of plague in the Colombia cases has been denied, but it has to be remembered that many of the South American Republics make a practice of denying point blank the existence of plague and yellow fever within their borders in order to escape the inconveniences of quarantine. On the other hand, from a trustworthy source comes the definite statement that the diagnosis of plague has been confirmed by bacteriological examination both of the sputum and the blood of several patients. It is also asserted that "cases of pneumonia of an infectious kind," nearly all of them fatal, have been occurring along the Colombian coast of the Caribbean Sea for more than a year, their true character and their relationship to plague not having been recognised until now. In the face of these facts it can scarcely be disputed that there are plague clouds threatening the United States, and it would appear that this has been officially recognised. Several articles on plague have lately been published in our American contemporary, *Public Health Reports*, the official organ of the United States Public Health Service, and in one of them the danger arising from the infected ground squirrels in California and the plague-stricken rats at Seattle is freely admitted, as also the advisability of giving exact information concerning the disease as far as practicable to all persons who may at very short notice be called upon to take their part in a comprehensive anti-plague campaign. For this purpose one of the articles, under the title of "Fleas and Plague," gives an account of the important series of experiments carried out by Bacot and Martin, of the Lister Institute, under the direction of the Commission for the Investigation of Plague in India, the results of which have added so materially to our knowledge of the mechanism of the transmission of plague by the rat-flea, and to which we have already directed attention in our issue of April 4th, 1914, p. 975. Another of the articles in *Public Health Reports* deals with some of the difficulties met with in the diagnosis of plague, mention being specially made of cases in which plague has been mistaken for filariasis; and an instance is quoted where a patient really suffering from filarial lymphangitis was thought to have genuine bubonic plague. The attention of practitioners in regions such as the West Indies, where filariasis occurs, was specially called to these cases. The Public Health Service of the United States has in its ranks a large number of highly trained and competent medical officers many of whom possess special experience of plague gained in various parts of the world. The services of these experts would at once be available in the event of the disease showing any tendency to extend beyond its present limits. Against this, however, is the assertion, made by those who apparently know, that some of the towns and districts likely to be invaded, if the infection spreads, are hardly in a satisfactory sanitary condition such as would enable them to repel successfully the insidious onset of plague. Perhaps the present season of the year is not altogether favourable for the immediate spread of plague in North America, but there is always the risk that the infection may gain a footing in one or more places where, under favouring conditions, later on it may break out with renewed virulence and spread to more populous districts in the interior.

---

[1] See THE LANCET, August 10th, 1912, p. 394.

THE PARALLELISM OF CAUSES OF DEATH.

THE comparative constancy of the death-rate from various diseases is suggested in a remarkable manner by a table issued by the New York Life Insurance Company. This table gives the causes of death of 8549 of the company's insured who died during the year 1912. We have received from the company a similar statement for the year 1913, and it is the close parallelism in the ratio of deaths from particular causes to the total death-rate that is of interest. We quote the figures in parallel columns:—

Causes of Death among 8549 Insured People who Died during 1912 and 8793 who Died during 1913.

	1912.		1913.
Heart disease	1060	......	957
Consumption	905	......	957
Bright's disease...	870	......	931
Pneumonia	700	......	673
Cancers and tumours	631	......	650
Apoplexy	603	......	641
Accidents	458	......	493
Diseases of digestive organs	309	......	289
Diseases of arteries	305	......	271
Paralysis	283	......	286
Liver disease	222	......	193
Bronchitis, pleurisy, &c.	179	......	209
Diabetes	176	......	155
Typhoid fever	154	......	140
Blood poisoning, anæmia, &c.... ...	144	......	148
Spinal disease	131	......	107
Appendicitis	116	......	117
Old age...	64	......	63
Nervous prostration, congestion of brain, &c.	40	......	29
Rheumatism	34	......	36
All other causes...	1165	......	1419
Total	8549		8793

The extra 244 deaths in 1913 are all accounted for in the last item, all other causes, which exceeds in 1913 by 254 the number under that heading in 1912. Some of the correspondences are very remarkable—e.g., rheumatism 34 and 36, appendicitis 116 and 117, blood conditions 144 and 148, paralysis 233 and 286. But throughout the table the parallelism is remarkable, and it is particularly worthy of notice that old age accounts for only 64 and 63 deaths respectively in the two years. Among the special infectious diseases it is noteworthy that only consumption, which is second on the list, with ratios of 11·7 and 10·9, and typhoid fever, with ratios of 1·8 and 1·59, are especially classified, from which is fair to conclude that none of the others have a ratio sufficiently large to justify their removal from the class of all other causes. The same remark applies to the venereal diseases. These causes of death, of course, are the immediate causes; it is only natural to suppose that rheumatism and perhaps other fevers and syphilis were remotely responsible for some of the large number of deaths from heart disease and some other conditions.

THE CLINICAL AND SEROLOGICAL EXAMINATION OF SYPHILITIC FAMILIES.

THE latest number of the *Deutsche Zeitschrift für Nervenheilkunde* is a *Festschrift* contributed by former and present assistants in honour of the jubilee of the well-known General Hospital of Hamburg-Eppendorf, and edited by Professor Dr. Nonne, in whose division of the hospital these assistants have worked. It contains a variety of papers of considerable neurological interest, of which a number, as might be expected from the fact of Dr. Nonne's superintendence, deal with syphilitic disease of the nervous system. Dr. Nonne himself contributes an article on the significance of examination of the cerebro-spinal fluid for the prognosis of cases where the only clinical symptom is an affection of the pupil. There is a paper on the earliest diagnosis of syphilitic invasion of the central nervous system, by Dr. Hauptmann, and another on syphilis as an antecedent in dementia præcox, by Dr. Meggendorfer. Attention may be drawn in detail to a contribution by Dr. Wilhelm Raven, on the serological and clinical investigation of syphilitic families. No fewer than 117 families have been examined, of each of whom at least one member was at one or other time an inmate of the hospital. In as many of the parents and children as could be reached a complete routine serological investigation and clinical examination were made. Not more than 27 members of these 117 families were completely normal; expressed in other words, only in 23 per cent. of the families subjected to examination was the syphilitic infection found to have been strictly confined to the individual first infected. In 77 per cent. it had been communicated to others of the family. To take the condition in the parents first: in 65 families where only one parent originally suffered from syphilis, 64 of the parents originally infected (father or mother) showed syphilitic disease or gave a positive Wassermann reaction in the blood. Of the parents not originally infected (mother or father as the case might be) 30, or 46 per cent., suffered from syphilitic nervous disease, 16, or 24 per cent., had a positive Wassermann reaction in the blood, while only 19, or 29 per cent., were normal. The condition of the children was investigated in 82 families: 8 out of 90 families were sterile. In these 82 families the results of 350 pregnancies were obtained. 47·7 per cent. ended in miscarriages or premature births and deaths in infancy; 52·3 per cent. children lived; of these, only 16·5 per cent. were fully normal, while 35·8 per cent. were pathological. Dr. Raven has obtained evidence to show that the more severe the syphilitic infection of the parents the less severe is the form it will take in the children; and *vice versâ*, where one parent (mostly the mother) has remained healthy, there the largest percentage of diseased children has been met with. These data do not agree with the findings of Hochsinger and others. They may be taken to suggest that the virulence of the syphilitic virus diminishes with its passage through the parents; the more intensive that passage, the less potent the effect of the virus on the descendants. Another interesting set of statistics concerns the matter of the bearing of paternal as opposed to maternal infection on the health of the progeny. This question was investigated in 72 families. In 52 the father was originally infected, and 154 pregnancies were recorded in the group; 17·5 per cent. were healthy children, 34·4 per cent. had signs (somatic or serological) of syphilis, 23·3 per cent. were stillbirths or died in infancy, and 24·6 per cent. were miscarriages. On the other hand, in the remaining 20 families the mother was originally infected; 74 pregnancies were in this group, of which only 5·4 per cent. resulted in healthy children, 20·2 per cent. were pathological, 32·4 per cent. died in infancy or were deadborn, while 41·8 per cent. were abortions. Thus about one-half of the children of the diseased fathers lived, but only about one-quarter of the mothers'; about one-third of the fathers' children that lived were healthy, but only about one-fifth of the mothers'. Speaking generally, the first, second, and third children of the infected families were more severely hit by the inherited disease than any others that might follow. However, not a few exceptions to this generalisation were noted. A healthy child, as Fournier said, is no guarantee for the health of the next arrival. Of a totality of 119 children of infected families, 10 per cent. suffered from organic nervous disease or were mentally abnormal; 37 per cent. showed various stigmata of degeneracy, and an additional 10 per cent. with stigmata had also a positive Wassermann reaction in the blood; 11 per cent. had a positive Wassermann reaction only, while 30 per cent. were normally healthy. Up to about the sixteenth year after parental infection congenitally diseased children may appear; thereafter any children born of the marriage are less likely to reveal any somatic or serological defect. The figures given by Dr. Raven are of value and deserve careful consideration. The conclusions are that persons who suffer from syphilitic nervous disease—spirochæta carriers—are actively infective; that syphilis is no less dangerous during a so-called latent period; that the presence of a positive Wassermann reaction in the blood can never be other than a serious indication of disease and of the necessity for treatment; otherwise syphilis will continue to descend upon the children to generation after generation.

THE Home Secretary, acting upon the recommendation of the Prison Commissioners, has appointed Miss Selina Fox, M.D., at present superintendent of the Bermondsey Medical Mission, to be Lady Superintendent and Deputy Medical Officer of the institutions for women at Aylesbury, comprising the female convict prison, the Borstal Institution for Females, the State Inebriate Reformatory for Women, and the Preventive Detention Prison for Women.

DEATH OF A VETERAN PRACTITIONER.—Mr. Henry Richard Foquett, M.R.C.S. Eng., L.S.A., of Portland-street, Ilfracombe, died on June 24th, from the result of a cycle accident, in his eighty-fifth year. Mr. Foquett, who qualified in 1852, practised in Ilfracombe for about 50 years, but retired from active work some years ago.

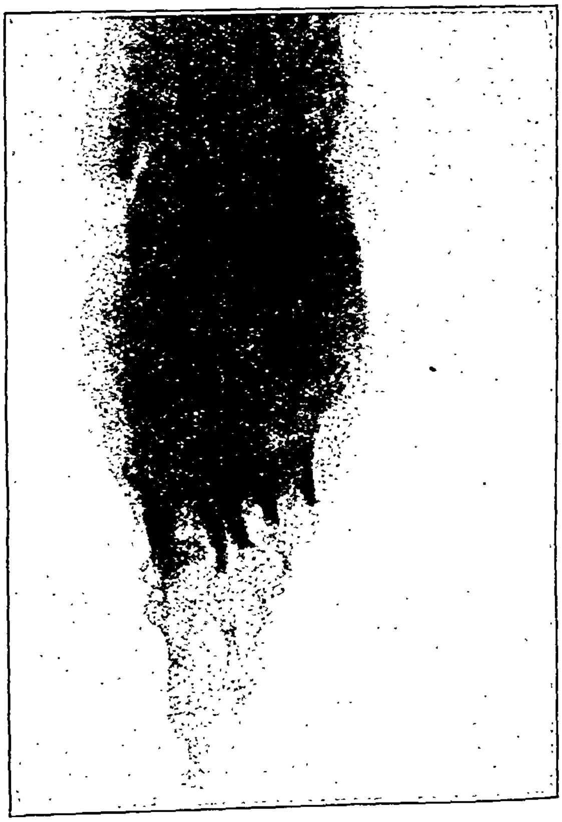
THE BOUND FEET OF THE CHINESE WOMAN.

The accompanying skiagrams were taken in Shanghai, and have been sent to us by the operator on the recommendation of Dr. F. M. Neild. We publish them with pleasure, as it is not at all easy to get a Chinese woman to submit to photographic processes, while the skiagrams well reveal the distortion caused by bandaging the feet.

The practice of binding the feet of Chinese women is still very prevalent among the better classes, in spite of all that is being done by the "Anti-footbinding Association." The spread of foreign ideas and familiarity with medical science have had some effect, but the barbarous custom still holds its own. The origin of the custom is put down by some people to the desire to emulate a certain club-footed Empress of China, and by others simply as a device of the Chinese men to prevent their women-folk from running away from home. Either motive is so consonant with Chinese ideas that it is quite likely that both have had their influence.

The feet are bound at the age of five or six years with strips of strong cotton material, eight or nine yards in length and about four inches wide. The bandages, once on, are not removed for some years.

Fig. 1.



Reproduction of photograph of Chinese woman's bandaged foot from the front.

Frequently the child suffers terribly, especially at night, when the feet swell with the warmth induced by sleep. Medical information on any sequelæ that may follow the treatment is not at all voluminous. That gangrene may be induced in a certain number of instances is obvious.

Women on becoming Christians usually unbind their feet, and they have stated that this process is more painful than that of binding. The lady to whom we owe the chance of publishing the skiagrams of a bound foot sends the following communication with them:—

> A Chinese woman of high rank lately went to an English medical practitioner in Shanghai, saying that she had heard that small feet were no longer fashionable, so she wished her feet to be made into their proper shape again. It was impossible to convince her that it could not be done. The process of unbinding has to be done very gradually, and signs of mortification are not unknown.

The pictures tell their own story, showing clearly how some bones have been compressed by bandaging, while others appear abnormally enlarged owing to their want of adaptation in their artificial positions. The owners of small feet are extremely reticent about them, and it is considered to be the height of immodesty to let a stranger see a bare unbound foot. The woman to whom the foot here shown belonged was an amah or children's nurse in an English family, and somewhat inured to European ideas, but she required a great deal of persuasion before she allowed the picture to be taken, and was afterwards looked upon with horror by her friends as a woman who had disgraced herself by her action.

Mr. Muirhead Little, to whom we submitted these illustrations, writes:—

> Since the discovery of the Roentgen rays a certain number of radiographs of Chinese women's feet have been taken, and I had one in my possession for some years, but none of them, I believe, have been representative of the highest degree of distortion. As a really small bound foot renders its owner almost incapable of locomotion, it follows that only the well-to-do can afford this doubtful luxury, and as a fact it is only in the wealthiest and most distinguished families that such feet are found. As your correspondent suggests, such ladies will not allow their feet to be examined, still less photographed, and all the radiographs have been taken from women of the working-class whose feet are only moderately deformed, allowing them still to carry out the duties of domestic service.
>
> Until recently, when the Anti-footbinding Association has made great progress, a Chinese woman with natural feet was considered disreputable, and the normal foot was associated with all that is vile. Sensible Chinese parents recognised the evils of the custom, which they dare not depart from for fear of the social ostracism of their daughters. Mr. Archibald Little[1] wrote some 30 years ago: "Mine host appeared with his little daughter .... She was a little *chétive* thing of 10 years, but from her size looking much younger, and so pale that I asked her father whether there was anything the matter with her. He said, 'No, but she was suffering from her feet.' .... Hers were bandaged up until they looked more like those of a doll than the feet of a human being, and the poor child never attempted to walk without holding on to someone's hand, and was always carried up and down the flights of steps which led from one courtyard to the other. My host, like other Chinamen with whom I have conversed on the subject, agreed that it was a pity for the children that such a custom existed. ....With the exception of the boatwomen in the south (the Han-shui-mei), and the aboriginal tribes in the west, as also perhaps a few beggars and outcasts, all the women of China, poor as well as rich, are crippled in this barbarous fashion." At the same time it must be remembered that the women of the Imperial family of China, and those of the Manchu nobility

---

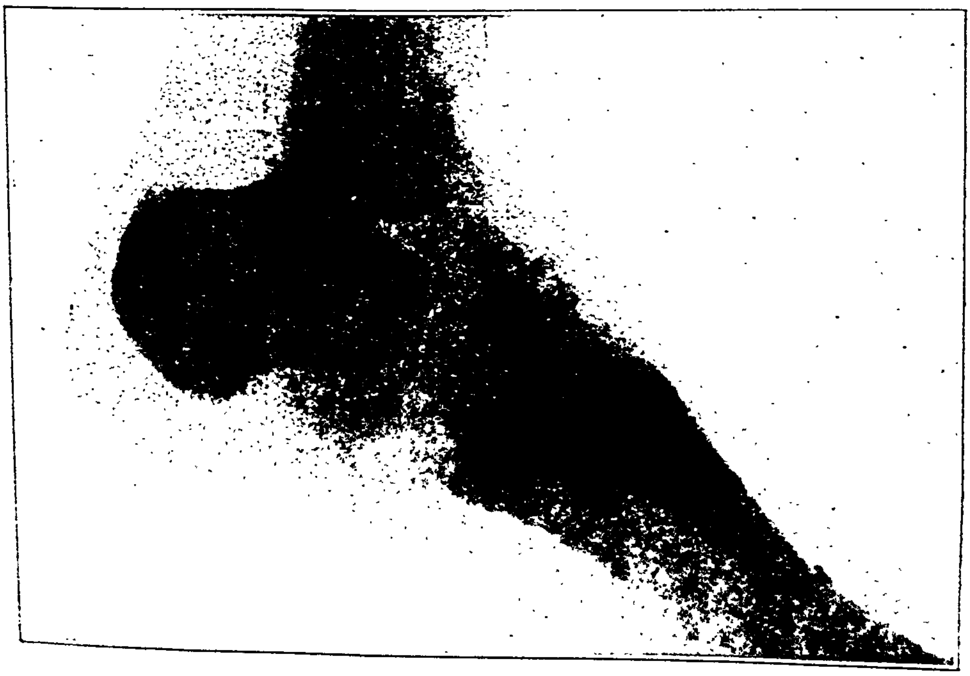
FIG. 3.



Foot of an English woman, showing proper position and relation of bones to each other.

who are allied to them by race, have never bound their feet. When in 1644 the Manchu Tartars conquered China they imposed the Tartar pigtail on the Chinese, but although they obliged the subject race to copy their head-dress they did not themselves adopt the ancient Chinese custom of foot-binding. As the Manchu garrison was designedly kept apart and made into a noble caste, the difference in the feet of the women no doubt helped to mark the gulf between conquerors and conquered, but it is remarkable that the Chinese should have been devotedly loyal to more than one Empress, whose unbound feet in one of their own ladies would have been horribly disgraceful and indecent. Flattery and imitation do not always go together, at least not in the Far East.

The effect of footbinding on health, and the contrast between the "slender listless appearance of young Chinese girls" and the "robust sturdy look of a Manchu family" whose acquaintance he made in Western China, very much struck Mr. Archibald Little before he noticed their feet, and he was at first at a loss to account for it.

Although the Manchu women's feet are not bound, they often wear shoes with very high heels placed right under the middle of the foot. These seriously hinder walking; and I am informed by an eye-witness that the late notorious Dowager Empress was so crippled by her shoes that she always rested both hands on the shoulders of her attendants when she had occasion to move about the audience hall.

As the skiagrams show, compression of the feet is obtained by producing two main distortions: In the first place, the foot is shortened by acute plantar flexion, chiefly at the transverse tarsal, but also at all the other joints of the tarsus and at the tarso-metatarsal articulations; thus the foot is forced into a position of talipes calcaneus. In the second place, the foot is compressed laterally, and the four outer toes are folded under the sole so that the end of the little toe may project beyond the inner (median) border of the metatarsal bone of the great toe. The proper dorsal surface of the outer toes will thus look downwards in the erect position and be exposed to pressure in walking. Obviously this must be a source of pain and cause of disability.

The reference to gangrene reminds me of an incident related by Dr. Kerr, for many years a medical missionary at Canton. A Chinese lady consulted him about her feet "Both .... had mortified off through binding; she had, however, brought them with her—*in spirits*—and now wanted the foreign doctor who could do such wonders to fasten them on for her again." [2]

FOURTEENTH FRENCH CONGRESS OF MEDICINE.—This Congress will be opened at Brussels on Sept. 30th in the afternoon, under the patronage of H.M. the King of the Belgians. Professor Henrijean will preside. In the evening there will be a presidential reception. The subjects on the programme are:—Oct. 1st: Cardiovascular Syphilis (M. Bayet, Nantes; M. Etienne and M. Spillman, Nancy; M. Vaquez and M. Laubry, Paris); Vaccinotherapy in General and the Special Vaccinotherapy of Cancer and Typhoid Fever (M. O. Gengou, Brussels; M. Chantemesse, Paris; M. Bruschettini, Genoa; M. Vincent and M. Doyen, Paris). Oct. 2nd, general session: The Therapeutic Value of Artificial Pneumothorax (M. Burnand, Leysin; M. Derscheidt and M. Geeraerd, Brussels; M. Dumarest, Hauteville; M. Kuss, Angicourt; M. M. L. Rénon, Paris). Sectional communications by M. Bernheim and M. Jaworsky, Paris. In the evening there will be a rout at the Hôtel de Ville de Bruxelles by the Communal Administration. Oct. 3rd, general session: The Lipoids in Pathology (M. Edg. Zunz, Brussels; M. Chauffard, M. Guy Laroche, and M. Grigaut, Paris; M. Linassier, Vichy; M. J. Bordet, Brussels; M. N. Waterman, Rotterdam). In the afternoon various communications will be offered. On Sunday, Oct. 4th, there will be an excursion to Spa. The subscription for attendance at the Congress by medical non-members is 20 francs, for students 10 francs. The usual reduction of 50 per cent. will be made on the French railways. The treasurer of the Congress, to whom subscriptions should be sent, is Dr. Godart Danhieux, 9A, Rue Montoyer, Brussels, and the general secretary is Professor René Verhoogen, 22, Rue Joseph II., Brussels.

"THE LANCET" HYGIENIC TEST FOR GAS FIRES.

JUDGING from the considerable correspondence which we have received from various well-known makers of gas fires, the test originated in THE LANCET Laboratory for arriving at the hygienic efficiency of these fires and described for the first time in these pages on Feb. 7th, 1914, has met with general approval and wide acceptance. In a report subsequently published in THE LANCET of April 4th, 1914, the results of the examination by this test of a number of gas fires then upon the market were presented. The list of gas fires examined was a very representative one, but we stated at the time that any omissions would be repaired in a subsequent article if the makers would submit any new designs claimed to be an advance on existing types.

This invitation was accepted, and within a week of the publication of the report Messrs. John Wright and Co., of Essex Works, Aston, Birmingham, submitted to us 12 of their 1913 pattern stoves, which, as the following results show, passed the requirements of THE LANCET test perfectly, even when no flue length was attached to the flue nozzle. There was no forward escape of combustion products at all. In the following table the straight lines represent the rim of the canopy of the stove, which was tested at five different points. The lines are only drawn straight for diagrammatic purposes and for the convenience of printing, and do not necessarily represent the shape of the canopy, which may have a straight or curved rim, as the case may be. Where the sign "o" occurs it signifies no leakage; in the event of leakage the sign + is used.

"THE LANCET" TEST OF GAS FIRES (John Wright and Co.).

Name of fire	*Standard.*	*Swastika.*	*Forum.*	*Druid.*
Without elbow ...	o o o o o	o o o o o	o o o o o	o o o o o
2-ft. elbow attached	o o o o o	o o o o o	o o o o o	o o o o o

Name of fire	*Herald.*	*Sorcerer.*	*Merlin.*	*Talisman.*
Without elbow ...	o o o o o	o o o o o	o o o o o	o o o o o
2-ft. elbow attached	o o o o o	o o o o o	o o o o o	o o o o o

Name of fire	*Warlock.*	*Stadium.*	*Mascot.*	*Wizard.*
Without elbow ...	o o o o o	o o o o o	o o o o o	o o o o o
2-ft. flue attached ...	o o o o o	o o o o o	o o o o o	o o o o o

Further experience of the test shows that certain precautions are necessary in applying it. It proves to be very delicate, and a gas fire which gives absolutely negative results with it has passed through a severe ordeal. Occasionally a leakage is shown at the extreme ends of the canopy, which often proves to be due to a slight external draught. In order to obviate this disturbance it has been found necessary to protect the stove from such outward disturbances by placing it within a three-way screen, the wings of which keep draughts away from the field of combustion or from the exit nozzle. This accounts for a discrepancy in the previous report, in which apparently the Merlin stove of Messrs. John Wright showed a slightly increased leakage after a 4-ft. length of flue had been attached, whereas with a 2-ft. flue, which should render less assistance to the ventilation of the combustion products, the results seemed to be better. In either case, however, the leakage was so small as to be hygienically negligible, and the fact that it was only occasional pointed to an external disturbing factor. During the test, therefore, the fire should be protected from draughts. In the test, it may be remembered, an absorbent pencil, made, for example, of chalk, is soaked in carbon tetrachloride and placed near the air inlet of the gas fire. Traces of carbon tetrachloride are thus drawn into the burners, with the result that on combustion hydrochloric acid is produced, which, although present in small proportion, is readily detected by coming into contact with ammonia, forming dense fumes of ammonium chloride. If, therefore, the products of combustion are "by-passing," this will instantly be shown by fumes being produced when an open tube containing strong ammonia solution, or a sponge soaked in the solution, is placed at various points along the rim of the canopy.

We have also received from Messrs. Arden, Hill, and Co., of Acme Works, Birmingham, four gas fires for test. The results are given in the following diagram. They show, again, that these fires are so constructed as to permit of no escape of combustion products at all except by way of the flue nozzle, and the attachment of a 2-ft. length of flue was not necessary in any case.

"THE LANCET" TEST OF GAS FIRES (Arden, Hill, and Co.).

Name of fire	*Gnome.*	*Loka.*	*Olak.*	*Kalo.*
Without elbow ...	00000	00000	00000	00000
2-ft. length attached	00000	00000	00000	00000

These results justify our expressed conclusion that "the present attitude of the gas fire industry towards all questions of improvement is a most satisfactory one, and our inquiry shows that we may fairly expect in the near future an encouraging and hopeful issue." Progress in the direction indicated will mean that no reproach based on hygienic considerations against the radiant system of gas heating can remain. We are still conducting tests with fires received from other makers, and we shall publish the results from time to time as the experiments are completed.

ST. MARY'S HOSPITAL. — The annual old students' dinner in October next will be presided over by Sir Almroth Wright.

THE PARLIAMENTARY COMMITTEE ON FOOD AND HEALTH AND THE MILK AND DAIRIES BILLS.—At a meeting of the Parliamentary Committee on Food and Health, held at the House of Commons and presided over by Mr. Charles Bathurst, M.P., the following resolution was moved by the chairman, seconded by Sir W. Phipson Beale, M.P., and carried unanimously:—

> The Parliamentary Committee on Food and Health cordially supports the Milk and Dairies Bill and Milk and Dairies (Scotland) Bill as measures designed to secure to the community an unrestricted supply of pure milk with the minimum amount of interference with the producer. While recognising them to be capable of improvement in some details, it earnestly deprecates the insistence on drastic amendments as calculated gravely to imperil the passage of Bills long overdue and of vital importance to the health of the people and especially of the children. The committee trusts, however, that a clause sanctioning the sale of "certified milk," which in the United States has played so important a part in raising the milk standard and in forming public opinion in favour of clean milk, will, by general consent and in the interests alike of producers and consumers, be included in both measures.

Additional copies may be obtained by forwarding a stamped addressed envelope to the secretary, 178, St. Stephen's House, Westminster, S.W.

SEVENTEENTH INTERNATIONAL CONGRESS OF MEDICINE (LONDON, 1913).

A FINAL meeting of the organising committee was held at 11, Chandos-street, Cavendish-square, W., in the rooms of the Medical Society of London, on Tuesday, July 7th. The President and 19 other members were present. The minutes of the last meeting were read and confirmed. Letters of regret for absence from several members were read. The following report of the finance committee was received, adopted, and ordered for entry on the minutes.

Report of the Finance Committee.

A subscription list towards the general expenses of the Congress was opened on Nov. 20th, 1910, and this list continued open until the date of the meeting in August, 1913.

Subscriptions thereto were received from 1613 individual members of the profession. Contributions were also generously made by the Royal College of Physicians of London, the Society of Apothecaries of London, the Royal College of Physicians of Edinburgh, the Royal College of Surgeons of Edinburgh, the Proprietors of THE LANCET, the Worshipful Companies of Merchant Taylors, Goldsmiths, Clothworkers, and Salters, also by Lady MacCormac, and Lady Butlin.

The total sum of £5418 5*s.* 7*d.* received from these sources was further augmented by £2834 4*s.* 4*d.*, the profit derived from the Congress Exhibition, and a sum of £195 3*s.* 11*d.* accruing from various sources, such as the sale of materials temporarily employed in the organisation of the central office and museum, and the interest on money placed upon deposit with the bankers.

To the above sums remains to be added £6494 11*s.* 9*d.* received in membership fees. Thus in all a grand total of £14,942 5*s.* 7*d.* was obtained.

An estimate of probable receipts and expenditure submitted by the honorary treasurers to the finance committee at an early date proved practically accurate as far as the expenses of organisation and the various sources of income are concerned. With regard, however, to the matter of entertainment, it should be noted that the reception committee undertook only a single evening conversazione, and that as on previous occasions the executive committee was largely indebted to the generosity of private individuals and public bodies for the highly successful social gatherings which took place. Mention of the various public bodies who gave invaluable help, both in affording accommodation for the meetings of the sections and in the exercise of hospitality, has already been made in the preface to the general volume of the Transactions. The estimate assumed further that, as on previous occasions, the sum received by payment of fees by members would suffice to meet the expenses of printing, publishing, and distributing the volumes of the Transactions of the Congress. When, however, the great mass of material afforded by the original papers and the discussions thereon came into the hands of the editors, a provisional estimate was asked for from the publishers as to the cost of printing and distribution. From that estimate, as submitted to the finance committee, it appeared obvious that the balance lying to the credit of the honorary treasurers would prove insufficient for the purpose for which it had been reserved. This insufficiency depended not only on the great mass of material to be printed, but also on the heavy cost to be entailed by the distribution of the volumes to members, so large a proportion of whom reside either on the continent, in America, or in the dominions beyond the seas.

The finance committee therefore decided to make an appeal to the officers of each section and subsection, and thus endeavour to raise from each an additional sum proportionate to the size of the section or subsection concerned, and to the expense incurred in printing and distributing its volume of the Transactions. The ready help afforded by all the sections (excepting those of orthopædics and dermatology, from whom no contributions have been received) towards meeting the expected deficiency resulted in the collection of £646 0*s*. 6*d*. In consequence, however, of editorial curtailment of some of the papers and discussions, and the unexpected receipt of a sum of £347 0*s*. 7*d*. by sales of the Transactions (up to date), the publishers' provisional estimate proved to have been excessive, with the result that the honorary treasurers found themselves with a balance of £337 19*s*. 8*d*. at the bank, as well as with a credit balance with the publishers of £59 2*s*. 4*d*. Since the sum realised by the special appeal was subscribed for the exclusive object of completing the Transactions, the finance committee decided that the balance of the money should be returned to the respective donors in proportion to the amount subscribed, and this decision has been already carried into effect. It may be noted that in spite of considerable curtailment the volumes of Transactions extend to the formidable total of 12,498 pages. The finance committee wishes to draw special attention to the remarkable promptitude and success with which this great undertaking has been carried out by the editorial secretaries of sections and the editorial committee, and also to the excellence with which the volumes, printed in three languages, have been produced, in a space of little more than six months, by the Oxford Press.

Now that all expenditure has been met, a sum of £49 1*s*. 2*d*. lies in the hands of the treasurers, which may still be slightly augmented by the sale of further copies of the Transactions, and it remains for the general committee to decide what shall be done with the eventual balance.

Mr. D'ARCY POWER moved, and the GENERAL SECRETARY seconded, and it was resolved that the following gentlemen be nominated as members of the National Committee of Great Britain and Ireland for the purposes of the International Congresses of Medicine, with power to add to their number: Dr. Theodore Dyke Acland, Sir Clifford Allbutt, K.C.B., Professor F. W. Andrewes, Sir Charles Ball, Bart., Mr. C. A. Ballance, M.V.O., Professor H. G. Barling, Sir James Barr, Dr. E. F. Bashford, Sir A. A. Bowlby, C.M.G., Mr. Stanley Boyd, Sir J. Rose Bradford, K.C.M.G., Dr. Mitchell Bruce, Sir Lauder Brunton, Bart., Dr. Dudley Buxton, Sir John Byers, Sir Francis H. Champneys, Bart., Sir Havelock Charles, G.C.V.O., Mr. Arthur Cheatle, Sir W. Watson Cheyne, Bart., C.B., Sir T. S. Clouston, Mr. Treacher Collins, Sir James Crichton-Browne, Sir Anderson Critchett, Bart., C.V.O., Sir Halliday Croom, Sir Bertrand Dawson, K.C.V.O., Dr. J. Gordon Dill, Professor A. F. Dixon, Sir Dyce Duckworth, Bart., Sir Frederick Eve, Mr. Hurry Fenwick, Sir David Ferrier, Dr. Magee Finny, Sir J. Kingston Fowler, K.C.V.O., Professor Sir Thomas Fraser, Dr. Galloway, Dr. Garrod, Sir Alfred Pearce Gould, K.C.V.O., Dr. Dundas Grant, the Director-General of the Medical Department of the Navy, the Director-General of the Army Medical Service, the Medical Adviser to the India Office, Dr. de Havilland Hall, Dr. C. O. Hawthorne, Sir Wilmot Herringham, Sir F. W. Hewitt, M.V.O., Mr. W. H. H. Jessop, Dr. Robert Armstrong-Jones, Mr. Robert Jones, Sir Alfred Keogh, K.C.B., Dr. Percy Kidd, Mr. Ernest Lane, Sir Arbuthnot Lane, Bart., Mr. J. B. Lawford, Colonel Sir William B. Leishman, Professor J. A. Lindsay, Professor Alexander Macalister, Sir Donald MacAlister, K.C.B., Sir Wm. Macewen, Sir John McFadyean, Mr. G. H. Makins, C.B., Professor Howard Marsh, Dr. Mercier, Sir J. W. Moore, Sir Henry Morris, Bart., Sir Malcolm Morris, K.C.V.O., Dr. F. W. Mott, Sir Berkeley G. A. Moynihan, Sir Shirley Murphy, Professor G. R. Murray, Sir T. Myles, Dr. Newsholme, C.B., Sir Thomas Oliver, Sir William Osler, Bart., Sir George Hare Philipson, Mr. D'Arcy Power, Sir James Reid, Bart., G.C.V.O., K.C.B., Professor Arthur Robinson, Dr. Rolleston, Sir Ronald Ross, K.C.B., Dr. Amand Routh, Dr. F. M. Sandwith, Professor R. Saundby, Sir Edward Schäfer, Mrs. Scharlieb, Sir Felix Semon, K.C.V.O., Sir Seymour Sharkey, Professor S. G. Shattock, Professor Sherrington, Professor T. Sinclair, Dr. Percy Smith, Dr. Herbert Spencer, Dr. Squire Sprigge, Professor Starling, Dr. G. F. Still, Dr. G. A. Sutherland, Mr. Charters Symonds, Dr. Fred. Taylor, Professor Alexis Thomson, Professor Arthur Thomson, Sir StClair Thomson, Professor Thorburn, Sir John Tweedy, Mr. E. F. White, Dr. Hale White, Professor Sinclair White, Sir Arthur Whitelegge, K.C.B., Sir William Whitla, Dr. Dawson Williams, and Sir Almroth Wright.

President: Sir Thomas Barlow, Bart., K.C.V.O. Secretaries: Dr. Clive Riviere, 19, Queen Anne-street, W., and Mr. H. J. Paterson, 9, Upper Wimpole-street, W.

The following resolutions were passed by the meeting arising out of the report:—

1. That it be left to the officers of the Congress to decide how the eventual balance from the general funds should be disposed of.
2. That the Royal Society of Medicine be asked to deposit the minute books and other records of the Congress in their library.
